Executive Summary

This document is an Environmental Impact Report (EIR) analyzing the environmental effects of the proposed Vic Trace Reservoir Replacement Project (Project). This section summarizes the characteristics of the Project, alternatives to the Project, and the environmental impacts and mitigation measures associated with the Project.

Project Title

Vic Trace Reservoir Replacement Project

Lead Agency/Project Sponsor and Contact

Project Overview

This EIR has been prepared to examine the potential environmental effects of the Vic Trace Reservoir Replacement Project. The following is a summary of the full project description, which can be found in Chapter 2, *Project Description*.

Project Location

The Project site encompasses the Vic Trace Reservoir parcel and various water infrastructure improvements in the Alta Mesa neighborhood in the City of Santa Barbara, California.

The Vic Trace Reservoir parcel covers approximately 15 acres (14.726 acres) and is located on City-owned property at 740 Dolores Drive, Santa Barbara (Assessor's Parcel Number [APN] 035-033-031). The parcel contains existing water infrastructure facilities, existing City communication facilities, and La Coronilla Park. Access to the Vic Trace Reservoir parcel is from La Coronilla Drive between residences at 1617 and 1633 La Coronilla Drive via an existing 20-foot-wide easement through the 1617 La Coronilla Drive property.

Underground water main pipeline (main) work is proposed within the public right-of-way (ROW) paved roadways near the Vic Trace Reservoir parcel, including La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road.

Project Characteristics

The Vic Trace Reservoir parcel encompasses approximately 15 acres on Lavigia Hill and has served as a central component of the City's water supply infrastructure since the construction of the Vic Trace Reservoir in 1956. The site contains a partially buried 10-million-gallon drinking water reservoir, the associated Valve Building, and telecommunications facilities, along with an abandoned 1935 oil well. The Project would involve improvements within this existing utility property to support continued water system reliability and operations while maintaining the parcel's surrounding open-space character. Access to the site is provided by a single paved driveway from La Coronilla Drive, with internal fencing and site security maintained around core facilities. The western portion of the parcel contains La Coronilla Park, an undeveloped public neighborhood park, while the remainder of the site consists of grassland, oak woodland, eucalyptus, sagebrush, and ice plant vegetation managed for fire safety. Offsite, existing water pipelines and the La Vista Del Oceano Pressure Reducing Valve (PRV) station are located beneath paved roadways in the surrounding Alta Mesa neighborhood, and the Project includes relocation of the PRV station to an undeveloped area within the public right-of-way.

Project Objectives

The objectives of the proposed Project include the following:

- Replace and upgrade aging water infrastructure to ensure safe and reliable drinking water;
- Improve existing facilities and install new facilities to enhance the operational reliability and resiliency, minimize the risk of future facility failures, and optimize hydraulics and operations of Vic Trace Reservoir and the City's water system;
- Maintain critical demand capacity (e.g., peak demands, structure fires, human consumption) and system pressure city-wide;
- Address updated federal regulations that require more robust security for water infrastructure; and
- Maintain the City's ability to store a large amount of water locally, which is a key element of Santa Barbara's strategy to remain resilient and resistant to local emergencies or other climate change-related issues (e.g., drought, storms, wildfires).

Alternatives

As required by the California Environmental Quality Act (CEQA), this EIR examines alternatives to the Project. The following two alternatives were evaluated:

- Alternative 1: No Project
- Alternative 2: Roof Replacement Only

Alternative 1 (No Project) Under the No Project Alternative, no construction, demolition, or facility upgrades would occur at the Vic Trace Reservoir. The site would continue operating under existing conditions, with no new structures, utilities, solar panels, lighting, mechanical equipment, grading, or ground disturbance. Because all physical and operational conditions would remain unchanged, this alternative would avoid all of the proposed Project's construction-related and operational impacts, including those associated with glare, air emissions, biological resources, cultural and tribal cultural resources, geology and soils, greenhouse gas emissions, hazardous materials, noise, vibration, transportation, and solid waste generation. Mitigation measures required for the

proposed Project, such as those related to air quality, biological resources, cultural resources, geology, noise, and transportation, would not be necessary under this alternative.

While the No Project Alternative would result in the least environmental impact, it would not meet any of the Project's fundamental objectives, including improving system reliability, modernizing facility infrastructure, or supporting renewable-energy generation and long-term operational resilience. As a result, although environmentally superior to the proposed Project, the No Project Alternative would not fulfill the Project's purpose or need.

Alternative 2 (Roof Replacement Only) would limit construction to replacing the existing roof of the Vic Trace Reservoir, with no new buildings, utilities, solar panels, grading, or vegetation removal. Unlike the proposed Project, this alternative would not introduce lighting, mechanical equipment, access improvements, or expanded construction areas. Because it would avoid all ground disturbance and new operational features, Alternative 2 would substantially reduce or avoid potential impacts in several resource areas, including aesthetics, air quality, biological resources, cultural and tribal cultural resources, geology and soils, greenhouse gas emissions, hazards, noise, vibration, transportation, and utilities. This alternative would also avoid the Project's potentially significant operational noise and special-status species impacts, and would not require implementation of associated mitigation measures. While Alternative 2 would meet the overarching objective of maintaining the reservoir's function, it would not achieve Project objectives related to site modernization.

Alternative 1 (No Project) was determined to be the environmentally superior alternative. Based on the alternatives analysis, Alternative 1 would avoid potentially significant impacts to archaeological resources, tribal cultural resources, and hazardous materials. However, this alternative would not meet any of the Project objectives. Pursuant to CEQA, if the No Project Alternative is identified as the environmentally superior alternative, another alternative needs to be identified as the environmentally superior alternative. Based on this consideration, Alternative 2 (Roof Replacement Only) would be the environmentally superior alternative. Compared to the proposed Project, Alternative 2 would result in reduced impacts to archaeological resources, tribal cultural resources, hazardous materials, and other environmental topic areas due the smaller project size. Alternative 2 would still meet Project objectives to improve existing facilities, maintain critical demand capacity, and maintaining the City's ability to store a large amount of water locally. However, Alternative 2 would not meet Project objectives to replace and upgrade aging water infrastructure and address updated safety regulations. Refer to Chapter 7, *Alternatives*, for the complete alternatives analysis.

Areas of Known Controversy and Issues to be Resolved

The EIR scoping process did not identify any areas of known controversy for the Project. Responses to the Notice of Preparation of a Draft EIR and input received at the EIR scoping meeting held by the City are summarized in Chapter 1, *Introduction*.

Project Approvals

The Project would require approval from the Santa Barbara Planning Commission.

Issues Not Studied in Detail in the EIR

Chapter 1, *Introduction,* summarizes topics from Appendix G of the *CEQA Guidelines* that were evaluated in the Initial Study prepared for the Project (Appendix A). As indicated in the Initial Study, there is no substantial evidence that significant impacts would occur in any of the following issue areas:

- Agriculture and Forestry Resources
- Energy
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Population and Housing
- Public Services and Utilities
- Recreation
- Wildfire

As a result, these topics are discussed in Section 4.11, *Effects Found Not to be Significant*.

Summary of Impacts and Mitigation Measures

Table ES-1 summarizes the environmental impacts of the Project, proposed mitigation measures, and residual impacts (the impact after application of mitigation, if required). Although distinct from mitigation measures, Project design features (PDFs) are also listed because they will be included as conditions of approval by the City to avoid potential biological and geological impacts. Impacts are categorized as follows:

- **Significant and Unavoidable.** An impact that cannot be reduced to below the threshold level given reasonably available and feasible mitigation measures. Such an impact requires a Statement of Overriding Considerations to be issued if the Project is approved per §15093 of the CEQA Guidelines.
- **Less than Significant with Mitigation Incorporated.** An impact that can be reduced to below the threshold level given reasonably available and feasible mitigation measures. Such an impact requires findings under Section 15091 of the CEQA Guidelines.
- **Less than Significant.** An impact that may be adverse, but does not exceed the threshold levels and does not require mitigation measures. However, mitigation measures that could further lessen the environmental effect may be suggested if readily available and easily achievable.
- **No Impact.** The Project would have no effect on environmental conditions or would reduce existing environmental problems or hazards.

Table ES-1 Summary of Environmental Impacts, Mitigation Measures, and Residual Impacts

Impact	Mitigation Measure(s)	Residual Impact
Aesthetics		
Impact AES-1: With adherence to existing City regulations, the proposed Project would not create a new source of substantial light or glare that would adversely affect daytime or nighttime views. Impacts would be less than significant.	No mitigation required.	Less than significant
Cumulative Impacts. Cumulative impacts would be less than significant.	No mitigation required.	Less than significant
Air Quality		
Impact AQ-1: The proposed Project would not result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable federal or State ambient air quality standard. The impact would be less than significant.	No mitigation required.	Less than significant
Impact AQ-2: The proposed Project would potentially expose sensitive receptors to substantial pollutant concentrations. Implementation of Mitigation Measure AQ-1 would be required, and the impact would be less than significant with mitigation incorporated.	**AQ-1: Tier 4 Construction Equipment** All mobile off-road equipment (wheeled or tracked) greater than 50 horsepower used during construction activities shall meet the United States Environmental Protection Agency's Tier 4 final standards. Tier 4 certification can be for the original equipment or equipment that is retrofitted to meet the Tier 4 Final standards. In the event where Tier 4 Final equipment is not viable at the time of the award of the construction contract, the equipment shall meet Tier 3 standards at a minimum. A copy of each equipment's certified tier specification or model year specification shall be available upon request at the time of mobilization of each piece of equipment. The City Environmental Analyst or designee shall ensure these requirements are incorporated into construction contract documents.	Less than significant
Cumulative Impacts. Cumulative impacts would be potentially significant; however, the Project would not result in a considerable contribution.	Mitigation Measure AQ-1 would be required.	No considerable contribution to cumulative impacts
Biological Resources		
Impact BIO-1: Construction of the Project has the potential to result in direct and indirect impacts to special-status wildlife species. Operation of the Project would be similar to existing conditions and would have a less than significant impact to special-status species. Following implementation of Mitigation Measures BIO-1 through BIO-4, the Project's construction impact would be less than significant with mitigation.	**BIO-1: Worker Environmental Awareness Program** Prior to the start of construction, all Project construction personnel shall attend an in-person Worker Environmental Awareness Program (WEAP) training, conducted by a City-approved biologist, to assist workers in recognizing biological resources which may occur in the Project area. The specifics of this program shall include: ▪ Identification of special-status species with potential to occur in the Project area; ▪ A description of the regulatory status and general ecological characteristics of special-status species with potential to occur; ▪ A review of the limits of construction and measures required to avoid and minimize impacts to biological resources within the work area; and ▪ Information regarding nesting birds. The City-approved biologist shall have the discretion to determine whether additional sensitive biological resources are included within the WEAP training. Project construction personnel shall sign a form provided by the trainer documenting they have attended the WEAP and understand the information presented to them. The Project contractor shall be responsible for ensuring crew members adhere to the guidelines and restrictions designed to avoid impacts to special-status species. When new construction personnel are added to the Project, the contractor shall confirm the new personnel receive the WEAP training before starting work. The training of personnel can include a video recording and/or the use of written materials rather than in-person training by the City-approved biologist. **BIO-2: Nesting Bird Management Plan** Prior to the start of construction, the City shall approve a Nesting Bird Management Plan for the Project. The Nesting Bird Management Plan shall be prepared by a City-approved biologist and shall include measures to avoid the unauthorized take or destruction of birds, eggs, or active nests, consistent with the Migratory Bird Treaty Act and Sections 3503, 3503.5, 3511, and 3513 of the California Fish and Game Code. At a minimum, the Plan shall include: ▪ Procedures, such as surveys, for determining whether nesting birds are present at or near Project work areas; ▪ Procedures for assessing the species, nesting stage, and expected fledge date if nesting birds are present; ▪ Procedures for establishing protective buffers, to be assessed on a nest-specific basis considering the species concerned, the stage of nesting, the proposed work activities in proximity to the nest, and intervening vegetation or other factors that could attenuate impacts; ▪ Descriptions of allowed and prohibited activities within specific nest buffers, as well as procedures for allowing encroachment into buffers; ▪ Procedures for addressing pauses in construction which may result in changed environmental conditions or presence of new nests; and ▪ Procedures for addressing inadvertent injury to birds, including identification of appropriate wildlife rehabilitation facilities. Requirements in the Nesting Bird Management Plan shall consider the season at which activities are occurring, and corresponding levels of avian activity and sensitivity.	Less than significant

Impact	Mitigation Measure(s)	Residual Impact
	BIO-3: Pre-Construction Presence/Absence Survey for Special-Status Wildlife Species Within seven days prior to the commencement of ground-disturbing activities, a City-approved biologist shall be retained to perform a survey for white tailed kite, Coastal whiptail, coast horned lizard, coast patch-nosed snake, and western red bat in natural habitat areas within the Project footprint and an appropriate buffer to determine the presence/absence of these species. The pre-construction survey shall be conducted on foot within the Project footprint and buffer. The City-approved biologist shall temporarily move any identified special-status species to outside of the construction area, and if appropriate temporary barriers shall be employed to prevent the animal's ingress to the Project area. Construction shall not proceed until the work area is determined to be free of special-status species. The results of these surveys shall be documented in a technical memorandum and provided to the City. **BIO-4: Biological Construction Monitoring** A City-approved biological monitor shall be present during initial ground disturbing activities and vegetation removal to confirm impacts to special-status plant and wildlife species are avoided. The monitor shall have the authority to halt construction activities to avoid potential impacts to special-status species. The results of biological monitoring shall be recorded and provided to the City.	
Impact BIO-2: Construction of the Project has the potential to result in direct impacts to lemonade berry scrub, a sensitive natural community. Following the implementation of Mitigation Measure BIO-5, this impact would be less than significant with mitigation.	**BIO-5: Lemonade Berry Scrub Restoration Plan** The City shall retain a City-approved biologist/restoration ecologist to prepare a Lemonade Berry Scrub Restoration Plan (RP) designed to offset construction-related impacts to lemonade berry scrub within the Project site. The RP shall provide compensatory restoration at a minimum ratio of 1:1 (e.g. 0.29 acre of lemonade berry scrub). Performance standards to be included in the RP shall be tied to measurable outcomes, such as percent native cover, species composition, and shrub survival rates. The RP shall include the following: ▪ A description of the impacted lemonade berry scrub ▪ A plant palette and methods of salvaging (including topsoil salvage), propagating, seeding, and/or planting the site to be restored; ▪ A schedule for restoration activities, that may include weed abatement, propagating and planting, soil preparation, and/or erosion control; ▪ Performance standards including: (1) survival of installed shrubs (e.g., 80 percent survival after two years), (2) native cover targets matched to reference conditions, and (3) absence thresholds for invasive species; ▪ Maintenance and monitoring necessary to confirm the restoration area meets the success criteria; and ▪ Identification of contingency and adaptive management measures to address unforeseen changes in site conditions or other components of the restoration project.	Less than significant
Impact BIO-3: Construction of the Project would include the removal of trees protected under City of Santa Barbara Municipal Code Section 15.20. Following the implementation of Mitigation Measure BIO-6, this impact would be less than significant with mitigation.	**BIO-6: Tree Protection Plan** Prior to the start of construction, an International Society of Arboriculture Certified Arborist shall prepare a Tree Protection Plan (TPP) for any City-protected trees to be retained on site, including trees with a root zone or crown that may be affected by Project activities. Protected trees shall be defined as trees regulated under SBMC 15.20 and 15.24 with at least one trunk measuring 4 inches or greater in diameter at 4 feet 6 inches above the highest natural grade adjacent to the trunk, consistent with City Standards. The TPP shall include, at minimum, the following: ▪ An inventory of Project site trees with a root zone and/or crown that may be impacted by the Project. ▪ A graphic depiction of each protected tree and the limits of proposed Project activities that could affect protected trees, including ground disturbance and any clearance trimming. ▪ Tree protection measures, including: ▫ Tree protection fencing, signage, and maintained condition for the duration of construction. ▫ Prohibited activities near trees and specified limited activities permitted only under Certified Arborist supervision. ▫ Root and crown protection and pruning standards. ▫ Measures to maintain tree vigor during construction. ▪ Tree replacement measures and specifications that shall be incorporated into the Landscape Plan for the Project, including: ▫ 75 replacement trees shall planted on site, as recommended at a City Department of Parks and Recreation hearing on February 25, 2026. The species of replacement trees shall be at the discretion of the City Arborist. ▫ Replace any unanticipated removed trees, with trees of like species at a minimum 1:1 ratio. ▫ Replacement trees shall be monitored and maintained for a minimum of two years or until success criteria is achieved. ▫ Performance success criteria (e.g. 80 percent survival).	Less than significant
Cumulative Impacts. Cumulative impacts would be potentially significant; however, the Project would not result in a considerable contribution.	Mitigation Measures BIO-1 through BIO-6 would be required.	No considerable contribution to cumulative impacts

Impact	Mitigation Measure(s)	Residual Impact
Cultural and Tribal Cultural Resources		
Impact CR-1: Construction of the Project has the potential to significantly impact previously recorded and unknown archaeological resources. Following implementation of Mitigation Measures CUL-1 through CUL-3, impacts would be less than significant with mitigation incorporated.	**CUL-1: Worker's Environmental Awareness Program (WEAP)** A City Qualified Archaeologist and local Chumash Tribal Representative shall be retained to provide a Workers Environmental Awareness Program (WEAP) to Project construction personnel, including field consultants and construction workers, prior to the commencement of ground disturbing activities. Chumash tribal representative should assist in preparation of the WEAP. The WEAP shall include: ▪ Applicable regulations including the requirement for confidentiality and consequences of violating state laws and regulations. ▪ Protocols for avoidance and appropriate measures for avoiding and minimizing impacts resources that could be present. ▪ Culturally appropriate treatment of any discovery of significance to Native Americans, including appropriate behaviors and responsive actions to follow, consistent with Native American tribal values. ▪ Relevant information outlining what to do and who to contact if any potential cultural resources or tribal cultural resources are encountered. All Project construction personnel shall attend the WEAP prior to performing any work. Copies of the training attendance sheets shall be provided to City staff as a record of compliance. As new construction personnel associated with ground disturbing activities are added during Project construction, they shall be required to review the WEAP and sign off with acknowledgement from the construction contractor, who shall inform the monitoring archaeologist and local Chumash tribal representative observer. **CUL-2: Archaeological and Native American Monitoring at Meigs Road and Dolores Drive Intersection** Prior to the start of construction, a City Qualified Archaeologist and a local Chumash tribal representative (e.g., Barbareño Band of Chumash Indians, Santa Ynez Band of Mission Indians, Coastal Band of the Chumash Nation) shall be retained to oversee monitoring during Project-related ground disturbing activities within 150 feet of the intersection of Meigs Road and Dolores Drive. ▪ If archaeological resources are encountered or suspected, work shall be halted or redirected immediately and the City Environmental Analyst shall be notified. The City Qualified Archaeologist shall assess the nature, extent and significance of any discoveries and develop appropriate management recommendations for archaeological resource treatment which may include, but are not limited to, redirection of grading and/or excavation activities, consultation and/or monitoring with a local Chumash tribal representative. ▪ If a discovery consists of possible human remains, the Santa Barbara County Coroner shall be contacted immediately pursuant to Health and Safety Code Sections 7050.5 and Public Resources Code Sections 5097.94, 5097.98, and 5097.99. If the Coroner determines that the remains are Native American, the Coroner shall contact the California Native American Heritage Commission to identify the Most Likely Descendant, who shall work with the City to determine the appropriate disposition of the remains in a location that ensures their preservation in perpetuity. A local Chumash tribal representative shall be retained to monitor all further subsurface disturbance in the area of the find. Work in the area may only proceed after the City Environmental Analyst grants authorization. ▪ If a discovery consists of possible prehistoric or Native American materials or artifacts, a local Chumash tribal representative shall be retained to monitor all further subsurface disturbance in the area of the find. Work in the area may only proceed after the Environmental Analyst grants authorization. ▪ If unknown tribal cultural resources (TCRs) are encountered or suspected, work shall be halted or redirected immediately and the City Environmental Analyst shall be notified. The local Chumash tribal representative monitor (and City Qualified Archaeologist if archaeological resources are identified) shall assess the nature, extent and significance of any discoveries and develop appropriate management recommendations for TCR and archaeological resource treatment. This may require additional consultation with other Chumash tribal representatives. Resulting management recommendations may include, but are not limited to, archaeological investigations to determine the spatial extent and characteristics of the resources within the Project area, possible alternative designs, sites, or construction methods to avoid the resource, and/or continued monitoring by the local Chumash tribal representative and archaeologist. **Archaeological Resources Construction Monitoring Report:** A final report on the results of the archaeological and TCR monitoring shall be submitted to the City Environmental Analyst within 180 days of completion of the steps outlined above. **CUL-3: Unanticipated Discovery of Archaeological and Tribal Cultural Resources** Prior to the start of construction, including any vegetation or paving removal, demolition, trenching or grading, contractors and construction personnel shall be alerted to the possibility of uncovering unanticipated subsurface archaeological features or artifacts associated with past human occupation. If such archaeological or tribal cultural resources are encountered or suspected, work shall be halted immediately. The City Environmental Analyst shall be notified, and a City Qualified Archaeologist shall be retained by the applicant to assess the nature, extent, and significance of the discovery. The City Qualified Archaeologist shall develop appropriate management recommendations for the treatment of archaeological resources, which may include, but are not limited to, redirection of grading and/or excavation activities, and consultation and/or monitoring with a local Chumash representative. The City Environmental Analyst shall determine when work shall proceed. If a discovery consists of possible human remains, or possible prehistoric or Native American artifacts or materials, the procedures identified in 7.1.2 Archaeological and Native American Monitoring at Meigs Road and Dolores Drive Intersection above shall be implemented.	Less than significant

Impact	Mitigation Measure(s)	Residual Impact
Impact TCR-1: No known TCRs have been identified within the Project site. The proposed Project may cause a substantial adverse change in the significance of a previously unknown or unidentified TCR due to Project construction activities. Following implementation of Mitigation Measures CUL-1 and CUL-3, impacts would be less than significant with mitigation incorporated.	Mitigation Measures CUL-1 through CUL-3 would be required.	Less than significant
Cumulative Impacts. Cumulative impacts would be less than significant.	No mitigation required.	Less than significant
Geology and Soils		
Impact GEO-1: K-factor ratings of Project site soils indicate a range of low to moderate soil erosion potential. The proposed Project would not result in substantial soil erosion or the loss of topsoil. This impact would be less than significant.	No mitigation required.	Less than significant
Impact GEO-2: The Project would involve excavation into soils with high paleontological sensitivity, which could significantly impact paleontological resources. Following implementation of Mitigation Measures GEO-1 and GEO-2, Project impacts would be less than significant with mitigation incorporated.	**GEO-1: Paleontological Resources Monitoring and Mitigation Plan** Prior to start of construction, the City shall retain a Paleontologist meeting the standards for a Paleontological Principal Investigator, as defined by the Society of Vertebrate Paleontology (Society of Vertebrate Paleontology 2025). The Paleontologist shall draft a Paleontological Resources Mitigation and Monitoring Plan, which shall direct all mitigation measures related to paleontological resources and be sent to the City Environmental Analyst or designee for their review and approval. The Paleontological Resource Mitigation Plan shall include the following: ▪ Paleontological Monitoring - Monitoring is to be conducted during ground-disturbing construction activities within previously undisturbed sediments assigned high paleontological sensitivity as identified and determined by the Paleontologist. Activities that will exclusively impact artificial fill and/or disturbed sediments will not require paleontological monitoring. Paleontological monitoring shall be conducted by a paleontological monitor with experience with collection and salvage of paleontological resources and who meets the minimum standards of the SVP (2025) for a Paleontological Resources Monitor. The Paleontologist may recommend that monitoring be reduced in frequency or ceased entirely based on geologic observations. ▪ Fossil Discovery - In the event of a fossil discovery by the Paleontologist, paleontological monitor or construction personnel, all construction activity within 50 feet of the find shall cease. The Paleontologist shall evaluate the find. If the Paleontologist determines the fossil(s) is (are) not scientifically significant, then construction activity may resume. If the Paleontologist determines the fossils may be scientifically significant, the following shall occur: ▫ Fossil Salvage - The fossil shall be salvaged (excavated and collected) to protect it from damage/destruction. Typically, fossils can be safely salvaged quickly by a single paleontological monitor with minimal disruption to construction. In some cases, larger fossils (such as complete skeletons or large mammal fossils) require more extensive salvage operations. After fossil salvage is complete, construction activity may resume. ▫ Fossil Preparation and Curation - Fossils shall be identified to the lowest (most-specific) possible taxonomic level, prepared to a curation-ready condition, and curated in a fossil repository per SVP (2025) standards, such as the Santa Barbara Museum of Natural History, along with all pertinent data, photos, and/or maps required by the repository. ▪ Final Paleontological Mitigation Report - Upon completion of ground-disturbing activities (or preparation and curation of fossils, if necessary), the Paleontologist shall prepare a final report describing the paleontological mitigation program's results. The report shall include a summary of the field and laboratory methods employed; an overview of Project geology; and, if applicable, an analysis of the recovered fossils. The report shall be submitted to the City and, if fossil curation occurred, the designated fossil repository. **GEO-2: Worker Environmental Awareness Program** Prior to the start of construction, the Paleontologist or their designee shall conduct a paleontological Worker Environmental Awareness Program (WEAP) training for Project construction personnel regarding the appearance of fossils and the procedures for notifying paleontological staff should fossils be discovered. Project construction personnel shall sign a form provided by the trainer documenting they have attended the WEAP and understand the information presented to them. The construction contractor shall be responsible for ensuring personnel adhere to the guidelines and restrictions designed to avoid impacts to paleontological resources. If new construction personnel associated with ground disturbing activities are added to the Project, the contractor shall confirm the new personnel receive the WEAP training before starting work. The subsequent training of personnel can include a video recording of the initial training and/or the use of written materials rather than in-person training by the Paleontologist.	Less than significant
Cumulative Impacts. Cumulative impacts related to soil erosion and the loss of topsoil would be less than significant. Cumulative impacts to paleontological resources would be potentially significant; however, the Project would not result in a cumulatively considerable contribution.	Mitigation Measures GEO-1 and GEO-2 would be required.	No considerable contribution to cumulative impacts

Impact	Mitigation Measure(s)	Residual Impact
Greenhouse Gas Emissions		
Impact GHG-1: The greenhouse gas emissions generated by the proposed Project would be consistent with the City of Santa Barbara Climate Action Plan, Santa Barbara County Association of Governments' 2050 Regional Transportation Plan/Sustainable Communities Strategy, and the 2022 Scoping Plan. Therefore, the proposed Project's potential impacts on greenhouse gas emissions would be less than significant.	No mitigation required.	Less than significant
Cumulative Impacts. Cumulative impacts would be potentially significant; however, the Project would not result in a cumulatively considerable contribution.	No mitigation required.	No considerable contribution to cumulative impacts
Hazards and Hazardous Resources		
Impact HAZ-1: Construction of the proposed Project could result in the accidental release of hazardous materials through demolition of the existing reservoir, abandonment of the oil well, and grading of potentially contaminated soils. However, required compliance with applicable regulations related to hazardous materials would minimize the risk of releases and exposure to these materials. Impacts would be less than significant.	No mitigation required.	Less than significant
Cumulative Impacts. Cumulative impacts would be less than significant.	No mitigation required.	Less than significant
Noise		
Impact NOI-1: Short-term construction of the Project would temporarily increase local noise levels that would temporarily exceed 10 dBA over the ambient noise level and the Federal Transit Administration's 80 dBA daytime and 70 dBA nighttime construction noise thresholds. Implementation of Mitigation Measure NOI-1 would reduce construction noise levels to the extent feasible; however, construction noise levels would still exceed thresholds. Therefore, impacts would be significant and unavoidable.	**NOI-1: Construction Noise Reduction** The construction contractor shall prepare and submit a Construction Noise Control Plan to City Environmental Analyst or designee for review and approval prior to issuance of permits authorizing on-site or off-site ground disturbance. The Construction Noise Plan shall be developed with input from the surrounding neighborhood. The Construction Noise Control Plan shall specify the noise reduction measures to be implemented during Project construction to reduce noise levels at residences that surround the Project site to the west, north, east, and south. Measures in the Construction Noise Control Plan may include, but would not be limited to, the following: ▪ Prior to the start of and for the duration of construction, the contractor shall properly maintain and tune all construction equipment in accordance with the manufacturer's recommendations to minimize noise emissions. ▪ Prior to use of any construction equipment, the contractor shall fit all equipment with properly operating mufflers, air intake silencers, and engine shrouds no less effective than as originally equipped by the manufacturer. ▪ Staging and delivery areas shall be located as far as feasible from residences. ▪ Installation of temporary sound barriers/blankets to break the line of sight to the extent feasible between construction equipment and residences. This may also be achieved during construction when performed in a depression where the earthen walls are able to break the line of sight between equipment and residences. ▪ To the extent consistent with applicable safety regulations, trucks operating with reverse motions alarms shall be outfitted with SAE J994 Class D or equivalent alarms (ambient-adjusting, or "smart alarms" that automatically adjust the alarm to 5 dBA above the ambient near the operating equipment), or switch off back-up alarms and replace with human spotters in compliance with all safety requirements and laws. ▪ A construction notification sign shall be posted at the job site, clearly visible to the public, that includes permitted construction days and hours, as well as the telephone numbers of the City of Santa Barbara's and the contractor's authorized representatives that are assigned to respond in the event of a noise complaint. This may also include signage along offsite work corridors when appropriate.	Significant and unavoidable
Impact NOI-2: The Project would include mechanical equipment that would generate operational noise levels that would not exceed City noise standards at nearby sensitive receivers. Impacts would be less than significant.	No mitigation required.	Less than significant
Impact NOI-3: Project construction would generate new vehicle trips that would increase noise levels on nearby roadways that would exceed traffic noise increase thresholds. As no feasible mitigation exists to reduce this impact, it would be significant and unavoidable.	Project construction would export soil through hauling trips that would travel down residential streets to reach Meigs Road. There are no alternative routes that would avoid these residential streets, and using them would be required to exit the area. In addition, construction traffic would follow speed limits and would not result in excess noise over that which is standard for these types of loaded trucks. Therefore, no feasible mitigation exists to reduce the project's potentially significant construction traffic noise impacts.	Significant and unavoidable
Impact NOI-4: Project construction would result in groundborne vibration in the Project site vicinity that may expose nearby structures to damaging vibration levels, which would be a potentially significant impact. This impact would be mitigated to less than significant with implementation of Mitigation Measure NOI-2.	**NOI-2: Construction Vibration Reduction Measures** Prior to the issuance of construction permits, the City of Santa Barbara shall verify that the construction plans include the following requirements: ▪ For construction activities within 25 feet of nearby residential structures, alternative low-vibratory equipment (e.g., static roller) shall be used.	Less than significant

Impact	Mitigation Measure(s)	Residual Impact
Cumulative Impacts. Cumulative construction noise impacts would be potentially significant, and the Project's contribution would be cumulatively considerable and significant and unavoidable. Cumulative vibration impacts and operational noise impacts would be less than significant.	Mitigation Measure NOI-1 would be required.	Considerable contribution to cumulative impacts
Transportation		
Impact TRA-1: Project construction would potentially conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities. However, the project would include Mitigation Measure TRA-1, which would require a detailed Traffic Control Plan. Following implementation of this mitigation measure, impacts would be less than significant.	**TRA-1: Enhanced Traffic Control Plan** In addition to the minimum requirements established by Part 6 (Temporary Traffic Control) of the California Manual on Uniform Traffic Control Devices the City shall incorporate the following requirements: ▪ The contractor shall maintain access to all driveways, residences, and businesses at all times unless otherwise specified. If a temporary closure of a driveway or access point is necessary, the contractor shall provide written notification to all affected residences and businesses at least 72 hours in advance. ▪ The contractor shall provide a minimum of 72 hours' advance notice to law enforcement, fire/emergency services public transit agencies, and school transportation providers prior to the start of construction. The contractor shall coordinate specifically with Santa Barbara Unified School District regarding bus pick up and drop off locations within the neighborhood. ▪ When a detour is required on Meigs Road, La Coronilla Drive, or Dolores Drive, portable message boards shall be placed on Meigs Road, north of La Coronilla Drive and south of Dolores Drive, at least 24 hours before any street closure. ▪ The contractor shall identify and maintain a designated detour route at all times. ▪ A minimum of one-lane traffic flow shall be maintained at all times on Ricardo Avenue.	Less than significant
Cumulative Impacts. Cumulative impacts would be potentially significant; however, the Project would not result in a considerable contribution.	Mitigation Measure TRA-1 would be required.	No considerable contribution to cumulative impacts
Utilities and Service Systems		
Impact UTIL-1: The proposed Project would not generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals. This impact would be less than significant.	No mitigation required.	Less than significant
Impact UTIL-2: The proposed Project would comply with federal, state, and local management and reduction statutes and regulations related to solid waste. This impact would be less than significant.	No mitigation required.	Less than significant
Cumulative Impacts. Cumulative impacts would be less than significant.	No mitigation required.	Less than significant

1 Introduction

This document is an Environmental Impact Report (EIR) for the proposed Vic Trace Reservoir Replacement Project (hereafter referred to as the "Project" or "proposed Project"). The Project consists of demolition of the existing Vic Trace Reservoir and construction of a new reservoir, associated infrastructure improvements on the Vic Trace Reservoir parcel, new underground pipelines, the relocation of an underground pressure reducing valve (PRV) station, and use of an adjacent home owned by the City of Santa Barbara for temporary construction offices. The Project is described in detail in Chapter 2, *Project Description*.

This section discusses (1) the purpose and legal authority for preparation of the EIR; (2) the lead, responsible, and trustee agencies; (3) the public scoping of the EIR; (4) the scope and content of the EIR; and (5) the environmental review process required under the California Environmental Quality Act (CEQA). The existing conditions and environmental setting for the Project are described in Chapter 3, *Environmental Setting*. Relevant background information for the Project and EIR background are discussed in Chapter 2, *Project Description*.

1.1 Purpose and Legal Authority

The proposed Project requires discretionary approval by agencies listed in Table 2-4 in Chapter 2, *Project Description*; therefore, the Project is subject to the environmental review requirements of CEQA. This EIR has been prepared in accordance with CEQA (Public Resources Code Section 21000 et seq.) and the *CEQA Guidelines*. In accordance with Section 15121 (a) of the *CEQA Guidelines* (California Code of Regulations, Title 14, Division 6, Chapter 3), the purpose of this EIR is to serve as an informational document that:

> "...will inform public agency decision makers and the public generally of the significant environmental effects of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project."

This EIR has been prepared as a project-level EIR pursuant to Section 15161 of the *CEQA Guidelines*. A project EIR is appropriate for a specific development project. As stated in the *CEQA Guidelines*:

> "This type of EIR should focus primarily on the changes in the environment that would result from the development project. The EIR shall examine all phases of the project, including planning, construction, and operation."

The EIR is to serve as an informational document for the public, City decision makers, and responsible and trustee agencies. The process will include public hearings before the City of Santa Barbara's Planning Commission to consider certification of the Final EIR and approval of the proposed Project.

1.2 Lead, Responsible, and Trustee Agencies

The *CEQA Guidelines* define lead, responsible and trustee agencies. The City is the Lead Agency for the Project because it holds principal responsibility for approving the Project.

A responsible agency refers to a public agency other than the lead agency that has discretionary approval over the project. A trustee agency refers to a state agency having jurisdiction by law over natural resources affected by a project.

Agencies notified of preparation of this EIR include the Central Coast Regional Water Quality Control Board, Santa Barbara Air Pollution Control District, Santa Barbara County Public Health Department, State Water Resources Control Board Division of Drinking Water Santa Barbara District, State Water Resources Control Board Drinking Water State Revolving Fund Program, and the California Department of Conservation, Geologic Energy Management Division (CalGEM).

1.3 Public Scoping of the EIR

The City distributed a Notice of Preparation (NOP) of the EIR for a 35-day agency and public review period starting on November 13, 2025, and ending on December 18, 2025. Distributed with the NOP was an Initial Study that identified issues found to have no impact or a less than significant impact and therefore not needing to be further addressed in an EIR. The Initial Study also identified potentially significant impacts to be assessed in this EIR. In addition, the City of Santa Barbara's Public Works Department held a public scoping meeting for the EIR on December 3, 2025. The meeting, held from 5:30 p.m. to 7:00 p.m., was aimed at providing information about the proposed Project to members of public agencies, interested stakeholders and residents/community members. The meeting was held at the Louise Lowry Davis Center located at 111 West Victoria Street. The City received thirteen written responses to the NOP, including four responses from a State agency and nine responses from public commenters. The NOP is presented in Appendix A of this EIR, along with the Initial Study that was prepared for the Project and the NOP responses received. Table 1-1 summarizes the content of the letters and where the issues raised are addressed in this EIR. The comments received on the NOP did not identify additional impacts that need to be assessed in the EIR.

Table 1-1 NOP Comments and EIR Response

Commenter	Comment	How and Where It Was Addressed
Agency Comments		
Native American Heritage Commission	The commenter explained that tribal consultation pursuant to Assembly Bill 52 would be required for any project for which an NOP is filed and detailed the requirements of AB 52 tribal consultation.	Tribal cultural resource impacts and Assembly Bill 52 consultation efforts are described in Section 4.4, *Cultural and Tribal Cultural Resources*, of the EIR.
California Department of Fish and Wildlife	The commenter raised issues related to special-status wildlife, special-status plants, sensitive vegetation communities, survey requirements, and mitigation/avoidance measures.	Biological resource impacts and mitigation measures are addressed in Section 4.3, *Biological Resources*, of the EIR.
California Department of Water Resources	The commenter inquires whether the reservoir qualifies as a State-jurisdictional dam and suggests future design changes may trigger DSOD oversight.	In the event the design of the reservoirs is changed and the Project would fall under DSOD jurisdiction, the City would complete a construction application prior to proceeding.

Commenter	Comment	How and Where It Was Addressed
Santa Barbara County Air Pollution Control District	The commenter expressed concerns about air quality impacts, including construction emissions, diesel generator permitting, potential Health Risk Assessment, off-road equipment emissions controls, and greenhouse gas emissions.	Air quality and greenhouse gas emissions impacts are addressed in Section 4.2, *Air Quality*, and Section 4.6, *Greenhouse Gas Emissions* of the EIR.
Public Comments		
Amanda Brock	The commenter expressed concerns about noise, construction disturbance, and general construction-related nuisance impacts to nearby residents.	Noise impacts are addressed in Section 4.8, *Noise*.
Beth Bastian	The commenter expressed concerns about construction-related noise, traffic, and vibration.	This comment relates to topics addressed in Section 4.8, *Noise*, and Section 4.9, *Transportation*, of the EIR.
Ken Krivulka	The commenter expressed concerns about noise, tree removal, ground stability/erosion, environmental impacts, and duration of construction.	These topics are addressed in Section 4.8, *Noise*, Section 4.5, *Geology and Soils*, and Section 4.3, *Biological Resources,* of the EIR.
Kathy Lovelace	The commenter expressed concerns about severe construction noise, environmental impacts, geologic/soil stability, disruptions, truck noise, work crew noise, health effects, water quality, hydrology, and general concern about project necessity.	This comment relates to noise, geology/soils, hydrology/water quality, and construction-related community effects. These topics are addressed in Section 4.8, *Noise*, Section 4.5, *Geology and Soils*, Section 4.11, *Effects Found Not to be Significant*, and Section 4.11, *Public Services,* of the EIR.
Mesa Neighbors	The commenter expressed concerns over noise limits, resident rights, decision-making transparency, and noise duration.	Noise impacts are addressed in Section 4.8, *Noise*.
Jacqueline Page	The commenter expressed concerns about tree removal, loss of large raptor nesting habitat, and the potential increase in rodent activity if mature trees are removed.	This comment relates to nesting raptors and habitat modification. Biological resource impacts are addressed in Section 4.3, *Biological Resources*, of the EIR.
Residents of Dolores Drive	The commenter expressed concerns with preserving natural open space, mature vegetation, and habitat for hawks and owls.	This comment relates to habitat modification and wildlife use of open space. These impacts are addressed in Section 4.3, *Biological Resources,* of the EIR.
Scott Family	The commenter expressed concerns over construction noise, communication, and project duration.	Noise impacts are addressed in Section 4.8, *Noise*.
Scott Family (2)	The commenter expressed concerns about construction noise, soil stability/erosion, tree removal, air quality, construction traffic, neighborhood safety, trash, and concerns regarding public participation.	This comment relates to topics addressed in Section 4.8, *Noise*, Section 4.5, *Geology and Soils*, Section 4.2, *Air Quality*, and Section 4.9, *Transportation*, of the EIR.

1.4 EIR Scope and Content

This EIR addresses impacts identified by the Initial Study to be potentially significant. The following environmental issue areas were found to include potentially significant impacts and have been evaluated in detail in this EIR:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural and Tribal Cultural Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Noise
- Transportation
- Utilities and Service Systems

Section 4.11, *Effects Found Not to be Significant*, of the Draft EIR summarizes environmental issues from the CEQA Checklist Appendix G that were addressed in the Initial Study. As indicated in the Initial Study, there is no substantial evidence that significant impacts would occur in any of the following issue areas:

- Agriculture and Forestry Resources
- Energy
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Population and Housing
- Public Services
- Recreation
- Wildfire

Chapter 6, *Alternatives*, was prepared in accordance with Section 15126.6 of the *CEQA Guidelines* and focuses on alternatives that are capable of eliminating or reducing significant adverse effects associated with the Project while feasibly attaining most of the basic Project objectives. In addition, the alternatives section identifies the "environmentally superior" alternative among the alternatives assessed. The alternatives evaluated include the CEQA-required "No Project" alternative and one alternative development scenario for the Project site.

The level of detail contained throughout this EIR is consistent with the requirements of CEQA. Section 15151 of the *CEQA Guidelines* provides the standard of adequacy on which this document is based. The *Guidelines* state:

> "An EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of the proposed Project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection, but for adequacy, completeness, and a good faith effort at full disclosure."

In preparing the EIR, use was made of pertinent City policies and guidelines, certified EIRs and adopted CEQA documents, and other background documents.

1.5 Environmental Review Process

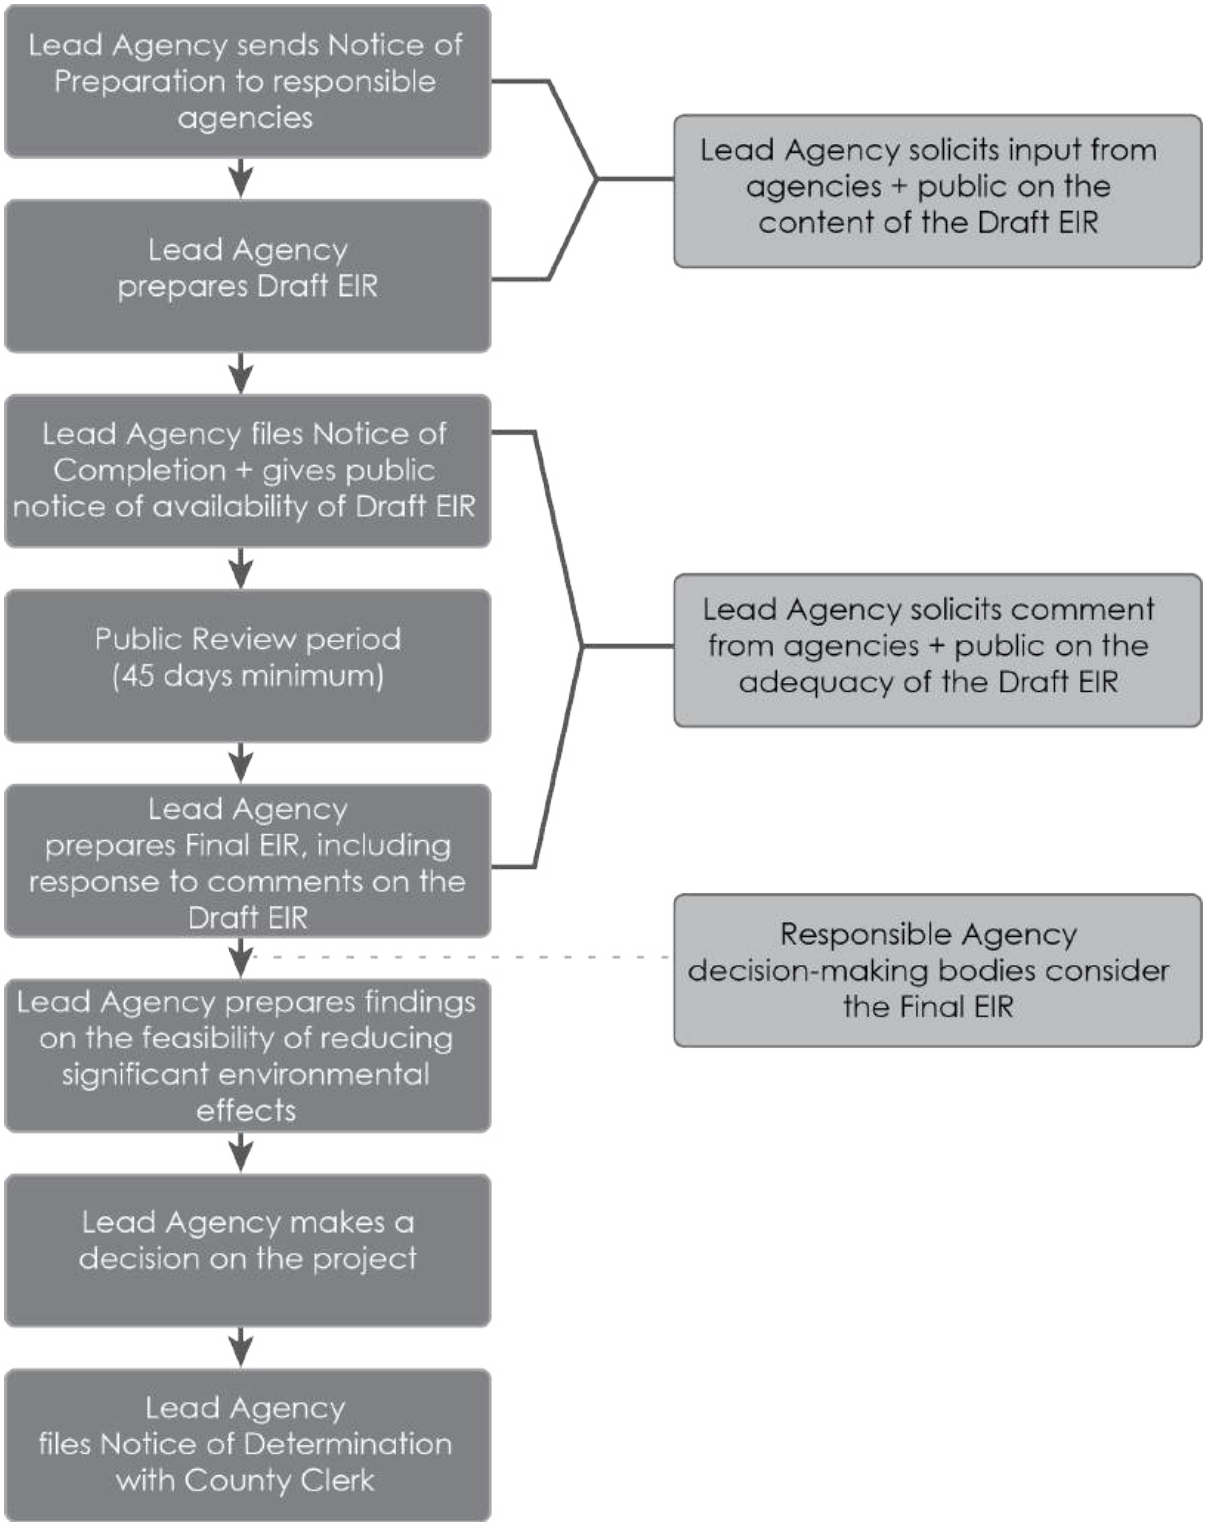
The environmental impact review process, as required under CEQA, is summarized below and illustrated in Figure 1-1. The steps are presented in sequential order and the EIR process is currently ongoing.

1. **Notice of Preparation (NOP) and Initial Study**. After deciding that an EIR is required, the lead agency (City of Santa Barbara) must file a NOP (State Clearinghouse No. 2025110233) soliciting input on the EIR scope to the State Clearinghouse, other concerned agencies, and parties previously requesting notice in writing (*CEQA Guidelines* Section 15082; Public Resources Code Section 21092.2). As described above, the City issued the NOP with an Initial Study on November 13, 2025, requesting comments on the proposed EIR scope of analysis within 35 days, ending on December 18, 2025. The NOP and Initial Study are included in Appendix A. Details regarding the EIR public scoping meeting are discussed in Section 1.2, *Environmental Impact Report Background*.
2. **Draft EIR Prepared**. The Draft EIR (i.e., this environmental document) must contain a) table of contents; b) introduction (summary); c) Project description; d) environmental setting; e) discussion of significant impacts (direct, indirect, cumulative, growth-inducing and unavoidable impacts); f) federal cross-cutters analysis[1]; g) discussion of alternatives; h) mitigation measures; and i) discussion of irreversible changes.
3. **Notice of Completion (NOC) and Notice of Availability (NOA).** The City of Santa Barbara must file an NOC with the State Clearinghouse when it completes a Draft EIR, and prepare a Public NOA of a Draft EIR. The City must file the NOA with the County Clerk's office for a minimum of 30 days (Public Resources Code Section 21092) and send a copy of the NOA to anyone requesting it (*CEQA Guidelines* Section 15087). The NOA is filed concurrently with the release of a Draft EIR for public review. Public notice of Draft EIR availability will be given through publication in a newspaper of general circulation and direct mailing to owners and occupants of contiguous properties. The lead agency must solicit input from other agencies and the public and respond in writing to all comments received (Public Resources Code Sections 21104 and 21253).

[1] This EIR has been prepared to meet the CEQA-Plus requirements. Accordingly, a federal cross-cutters analysis has been included in the EIR, while not typically required under the *CEQA Guidelines*.

4. **Draft EIR Public Review**. When a Draft EIR is sent to the State Clearinghouse for review, the public review period must be 45 days unless the State Clearinghouse approves a shorter period (Public Resources Code 21091). Public hearings at the Planning Commission will be held during circulation to receive public comments on the EIR. Hard copies of the Draft EIR and other Project-related information will be made publicly available at the City's Public Works and Community Development Departments, located at 630 Garden Street in the City of Santa Barbara, and at the Santa Barbara Public Library, located and 40 East Anapamu Street in the City of Santa Barbara. Digital copies will be made accessible online at the City's website: https://SantaBarbaraca.gov/EIR
5. **Final EIR.** A Final EIR must include a) the Draft EIR; b) copies of comments received during public review; c) a list of persons and entities commenting; and d) responses to comments.
6. **Certification of Final EIR.** Prior to deciding on the proposed Project, the City of Santa Barbara must certify that a) the Final EIR has been completed in compliance with CEQA; b) the Final EIR was presented to the Planning Commission; and c) the Planning Commission reviewed and considered the information in the Final EIR prior to approving a project (*CEQA Guidelines* Section 15090).
7. **Lead Agency Project Decision.** The lead agency may a) disapprove the Project because of its significant environmental effects; b) require changes to the Project to reduce or avoid significant environmental effects; or c) approve the Project despite its significant environmental effects, if the proper findings and statement of overriding considerations are adopted (*CEQA Guidelines* Sections 15042 and 15043).
8. **Findings/Statement of Overriding Considerations**. For each significant impact of the Project identified in the EIR, the City of Santa Barbara must find, based on substantial evidence, that either: a) the Project has been changed to avoid or substantially reduce the magnitude of the impact; b) changes to the Project are within another agency's jurisdiction and such changes have or should be adopted; or c) specific economic, social, or other considerations make the mitigation measures or Project alternatives infeasible (*CEQA Guidelines* Section 15091). If the City approves the Project with unavoidable significant environmental effects, it must prepare a written Statement of Overriding Considerations that sets forth the specific social, economic, or other reasons supporting the City's decision.
9. **Mitigation Monitoring Reporting Program**. When the City of Santa Barbara makes findings on significant effects identified in the EIR, it must adopt a reporting or monitoring program for mitigation measures that were adopted or made conditions of Project approval to mitigate significant effects.
10. **Notice of Determination (NOD).** The lead agency must file a NOD after deciding to approve a Project for which an EIR is prepared (*CEQA Guidelines* Section 15094). A local agency must file the NOD with the County Clerk. The NOD must be posted for 30 days and sent to anyone previously requesting notice. Posting of the NOD starts a 30-day statute of limitations on CEQA legal challenges (Public Resources Code Section 21167[c]).

Figure 1-1 Environmental Review Process



This page intentionally left blank.

2 Project Description

The City of Santa Barbara ("City"), the lead agency under the California Environmental Quality Act (CEQA), is proposing the Vic Trace Reservoir Replacement Project ("Project" or "proposed Project") to replace aging water infrastructure and implement various infrastructure improvements. The proposed Project includes the following main elements: Vic Trace Reservoir Parcel Improvements, underground water pipelines, and an underground Pressure Reducing Valve (PRV) station relocation. Project characteristics are described in detail in Section 2.6.

This chapter describes the proposed Project's need and objectives, provides a detailed summary of the anticipated construction and operational characteristics, and lists the anticipated permits and approvals required to implement the proposed Project.

2.1 Lead Agency

Planning Division, City of Santa Barbara
P.O. Box 1990
Santa Barbara, California 93102

2.2 Project Applicant Contact Person

Applicant: City of Santa Barbara, Public Works Department

Applicant Representative:

Kelly Bourque, Senior Project Engineer
City of Santa Barbara
Department of Public Works
(805) 564-5579
VicTrace@SantaBarbaraCA.gov

Owner: City of Santa Barbara

2.3 Project Location

The Project site encompasses the Vic Trace Reservoir parcel, 1633 La Coronilla Drive, and various water infrastructure improvements in the Alta Mesa neighborhood in the City of Santa Barbara, California.

The Vic Trace Reservoir parcel covers approximately 15 acres (14.726 acres) and is located on City-owned property at 740 Dolores Drive, Santa Barbara (Assessor's Parcel Number [APN] 035-033-031). The parcel contains existing water infrastructure facilities, existing City communication facilities, and La Coronilla Park. Access to the Vic Trace Reservoir parcel is from La Coronilla Drive between residences at 1617 and 1633 La Coronilla Drive via an existing 20-foot-wide easement through the 1617 La Coronilla Drive property.

A single-family residence located at 1633 La Coronilla Drive is owned by the City of Santa Barbara and is proposed to be used for temporary construction offices during the Project.

Underground water main pipeline (main) work is proposed within the public right-of-way (ROW) paved roadways near the Vic Trace Reservoir Parcel, including La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road. For a tabular summary of the Project components, refer to Table 2-1 Location of Project Components.

Table 2-1 Location of Project Components

Project Components	Location
Vic Trace Reservoir Parcel Improvements	
Vic Trace Reservoir Parcel Improvements and Reservoir Replacement	740 Dolores Drive, Santa Barbara (APN 035-033-031)
Offsite Improvements	
Temporary construction offices	1633 La Coronilla Drive, Santa Barbara (APN 035-033-007)
Relocated La Coronilla Transmission Main	Public ROW in roadway from intersection of Meigs Road westward to Vic Trace Reservoir driveway entrance
Replaced Vic Trace Outlet Main	Public ROW in roadway from Vic Trace Reservoir driveway entrance west along La Coronilla Drive, then south along Dolore Drive to the intersection of Meigs Road and Dolores Drive, then south on Meigs Road to Red Rose Way
Replaced Dolores Drive Main	Public ROW in road from intersection of La Coronilla Drive and Dolores Drive southwest towards Meigs Road
New Ricardo Avenue Main	Public ROW in roadway from the intersection of Dolores Drive and Ricardo Avenue westward towards La Vista Del Oceano
Entry/Exit Pits for La Vista Del Oceano Main Lining	Public ROW in roadway – temporary entry pit located in roadway at 652 Ricardo Avenue, temporary exit pit located in roadway west of 1528 La Vista Del Oceano
Existing PRV Station (to be abandoned)	Public ROW in roadway west of 1521 La Vista Del Oceano
Proposed PRV Station (to be constructed)	Public ROW east of intersection of Dolores Drive and Meigs Road on Dolores Drive between curb and private property at 1740 Cliff Drive

ROW = right of way
Main = water pipeline
PRV = pressure regulating valve

Construction access routes are described in Section 2.7.5, Construction Staging and Traffic.

Figure 2-1 Regional Location, displays the regional location of the Project site, and Figure 2-2 Project Site Location, displays the location within a neighborhood context. Figure 2-3 Topographic Map shows a topographic map of the Project site.

2.4 Existing Site Characteristics

Vic Trace Reservoir Parcel

The Vic Trace Reservoir parcel (site) covers approximately 15 acres and contains Lavigia Hill. The peak of Lavigia Hill sits approximately 460 feet above sea level, 50 feet higher than the site entrance at La Coronilla Drive.

The parcel hosts existing City-owned infrastructure facilities, including:

- **Vic Trace Reservoir:** Vic Trace Reservoir is a partially buried drinking water storage reservoir with a storage capacity of 10 million gallons (MG). Located in the center of the parcel at the top of Lavigia Hill, the reservoir was constructed in 1956 of rectangular concrete and measures 248 feet in width, 380 feet in length, and with a side water depth of 20 feet. The concrete-lined reservoir sits primarily below ground, surrounded by a raised concrete foundation. Above ground, the reservoir is covered by a low-pitched side gabled roof sheathed in corrugated metal siding on a low concrete wall. The existing reservoir extends approximately 4 feet above ground level and is not visible from adjacent public roads.
- **Valve Building:** The Valve Building is located at the northern entrance to the Vic Trace Reservoir parcel, adjacent to the driveway/easement from La Coronilla Drive. The structure was built in 1956 and is 25 feet long, 20 feet wide, and 14 feet tall. It is constructed of poured concrete and capped by a flat roof. The Valve Building contains control valves for the reservoir, the La Coronilla Pump Station, post-water disinfection (chlorine) storage and feed equipment, and an adjacent metering vault and hydropneumatic tank.
- **Telecommunications Facilities**: City radio equipment and a communication facility are situated on the parcel, which is also leased by AT&T and Santa Barbara Wireless Foundation (previously known as the Santa Barbara Amateur Radio Club). Both lessees will be vacating the site and removing their facilities by 2027. A City-owned Information Technology (IT) Building 30 feet long by 27 feet wide houses a generator, with a connected 250-gallon diesel fuel tank outside of the building. A second mobile structure is owned by the Santa Barbara Wireless Foundation and is anticipated to be removed by October 31, 2026.
- **Abandoned Oil Well:** An existing, previously abandoned oil well (drilled and abandoned in 1935) is located in the vicinity of the north-east corner of the existing Vic Trace Reservoir. The oil well was drilled to a depth of 1,555 feet. The oil well did not produce any oil and was abandoned per State of California Division of Oil and Gas abandonment procedures in the same year.

One ingress and egress driveway provides site access to the Vic Trace Reservoir parcel. A one-lane, 20-foot wide paved road runs from La Coronilla Drive southward up Lavigia Hill to the existing reservoir and telecommunication facilities. An unpaved approximately 8-foot wide access road continues intermittently around the perimeter of the reservoir. A combination of chain link and shepherds hook fencing (5-8 ft tall) surround the perimeter of the property (with the exception of La Coronilla Park). A second internal chain link fence (7 ft tall) encloses the reservoir roof area. A locked, chain link security gate is located at the property entrance.

The western portion of the Vic Trace Reservoir parcel also contains La Coronilla Park, an undeveloped, vegetated neighborhood park situated between 726 and 812 Dolores Drive.

Other than the developments described above, the remainder of the Vic Trace Reservoir parcel is generally undeveloped with vegetation communities such as grassland, coast live oak woodland, eucalyptus grove, sagebrush, and ice plant mats. The parcel is regularly mowed and vegetation is

maintained for fire suppression. Unauthorized pedestrian gates have been installed by private property owners along the perimeter fencing. Figure 2-4 shows site photographs of existing conditions at the Vic Trace Reservoir parcel and offsite infrastructure improvement areas.

Offsite Improvements

Offsite of the Vic Trace Reservoir parcel, the existing pipelines and the existing La Vista Del Oceano Pressure Reducing Valve (PRV) station are located underground in paved roadways in the Alta Mesa residential neighborhood surrounding the Vic Trace Reservoir site. PRV stations convey and regulate water between zones of different water pressure across the City. The proposed PRV station relocation site is located on undeveloped land in public right-of-way (ROW), in between a paved curb, sidewalk and a fenced private property.

The single-family residential home and property at 1633 La Coronilla Drive is owned by the City of Santa Barbara. The home was purchased with the goal of providing possible emergency operator housing and/or rest area. The Project will temporarily use the property for Project construction offices to provide a safer and more accessible area for neighbors to communicate and coordinate with Project personnel.

2.4.1 Current Land Use Designation and Zoning

The portion of the Vic Trace Reservoir parcel containing water infrastructure facilities has a General Plan land use designation of Institutional and is zoned as residential single unit with a 15,000 square foot minimum lot size (RS-15). The portion of the Vic Trace Reservoir parcel containing La Coronilla Park has a General Plan land use designation of Parks and Open Space and is zoned as a Park and Recreation (P-R). According to the City of Santa Barbara's General Plan Open Space, Parks and Recreation Element, La Coronilla Park is designated as a "Neighborhood Park."[1]

The Offsite Improvement areas are located within paved roadways, public ROW, and at 1633 La Coronilla Drive within the surrounding residential neighborhood generally designated as Low Density Residential, with a zoning designation of RS-15 (Residential Single Unit, 15,000 square foot minimum lot size) and RS-7.5 (Residential Single Unit, 7,500 square foot minimum lot size).

Land uses for the Project site and surrounding area are shown in Figure 2-8. Zoning is shown in Figure 2-9.

2.4.2 Surrounding Land Uses

The Project site is situated in the Alta Mesa residential neighborhood, which consists of single-family residences, a church, and streets. Residential land uses surround the Vic Trace Reservoir parcel to the north, south, east, and west. Commercial land uses straddle the portion of pipeline alignment traversing Meigs Road. Surrounding land uses are labeled in Figure 2-2.

Figure 2-8 Land Use Map

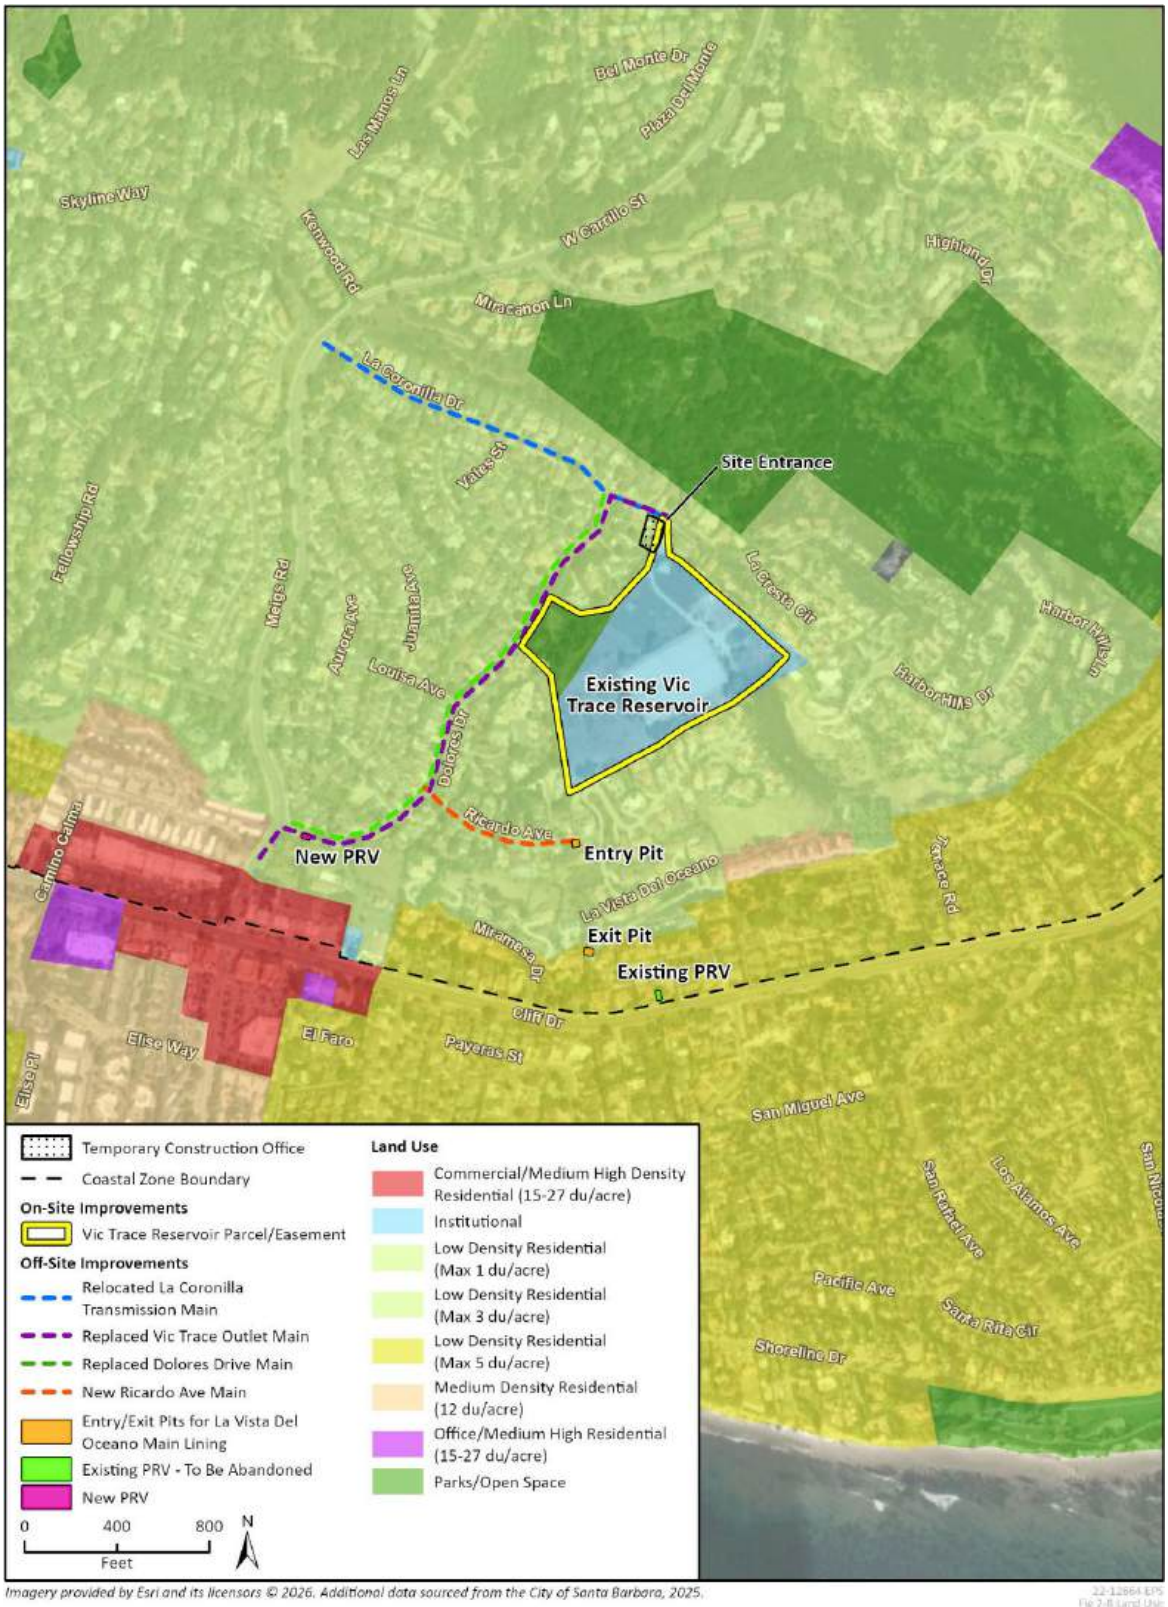

Figure 2-9 Zoning Map

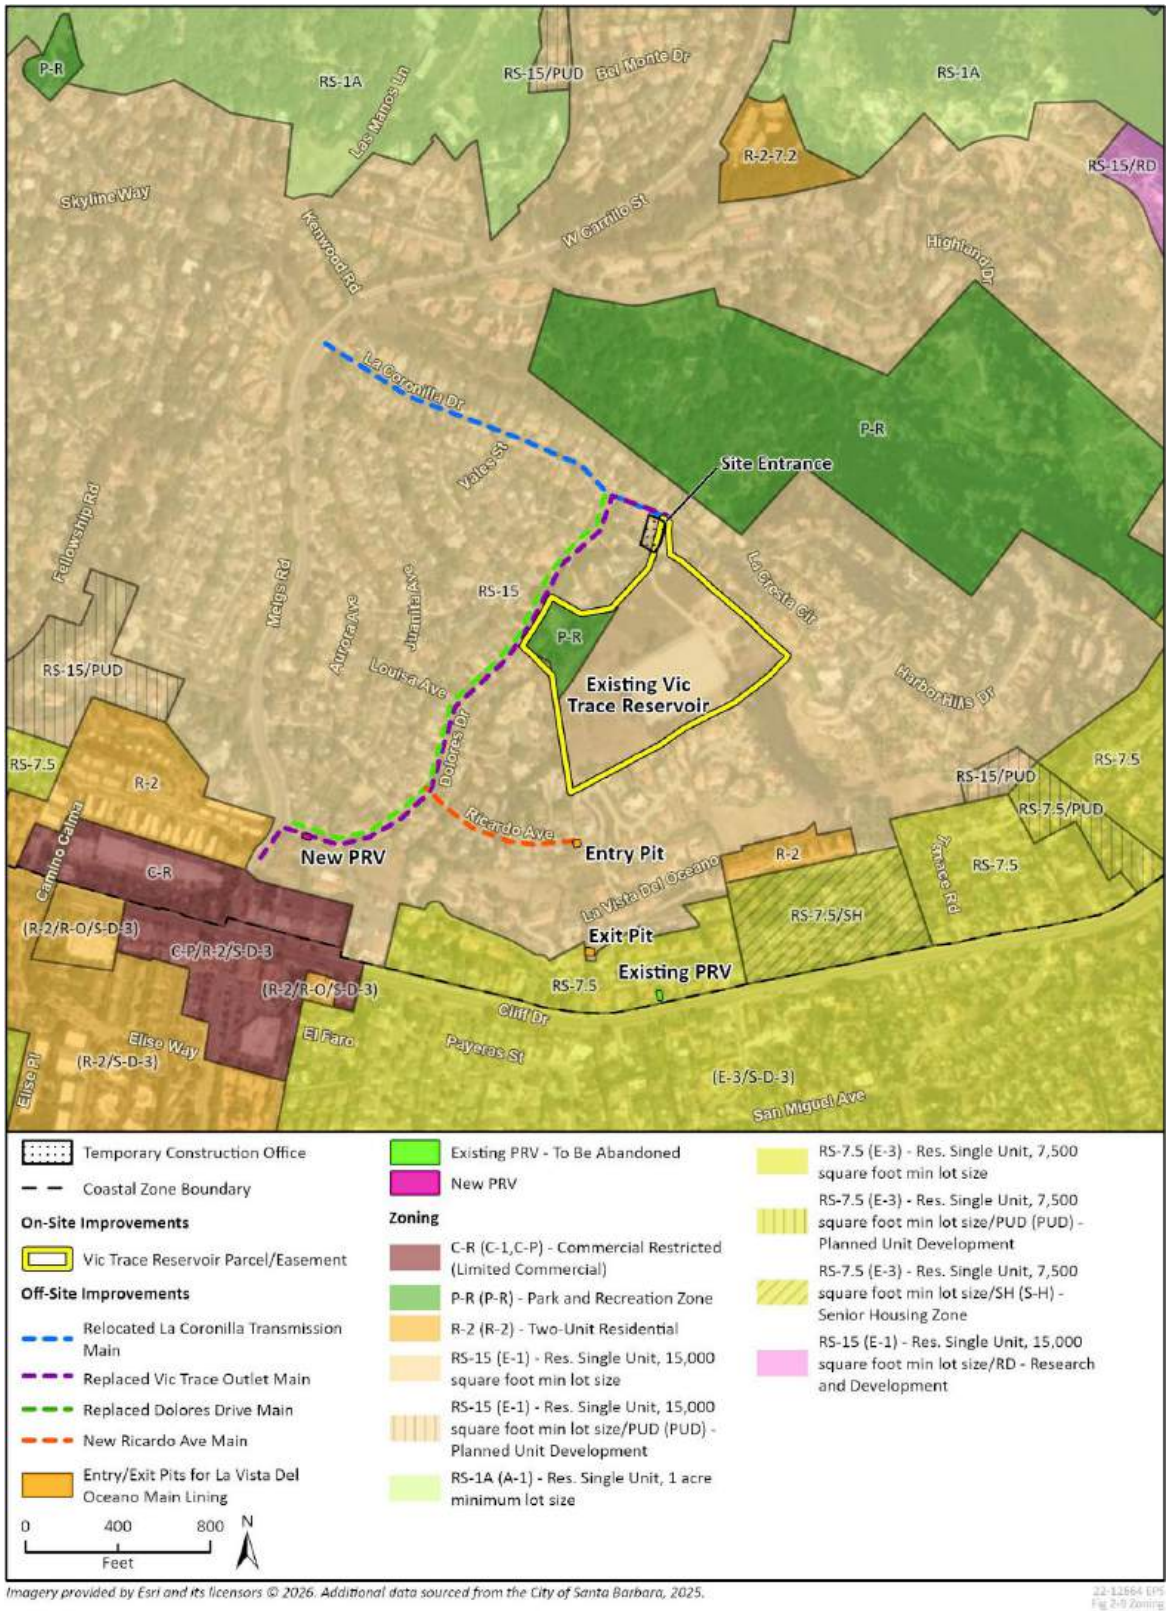

2.5 Project Objectives

Originally constructed in 1956, Vic Trace Reservoir is the City of Santa Barbara's largest single water storage reservoir. It serves as a vital component of the City's water distribution system, serving nearly 60,000 people or approximately 70% of Santa Barbara's population.

In 2021, the City's Water Distribution Infrastructure Plan (WDIP) developed recommendations to address the City's water distribution and supply needs through 2050. The WDIP recommended replacement of Vic Trace Reservoir due to its age, increasing repair needs, and importance to the City's overall water storage portfolio. Related offsite water infrastructure improvements in the Alta Mesa neighborhood were also identified to replace aging infrastructure, improve water system hydraulics, and address worker safety issues (safe facility ingress and egress).

Pursuant to *CEQA Guidelines* Section 15124(b), an EIR shall contain a statement of objectives sought by the proposed Project. The objectives of the proposed Project include the following:

- Replace and upgrade aging water infrastructure to ensure safe and reliable drinking water;
- Improve existing facilities and install new facilities to enhance the operational reliability and resiliency, minimize the risk of future facility failures, and optimize hydraulics and operations of Vic Trace Reservoir and the City's water system;
- Maintain critical demand capacity (e.g., peak demands, structure fires, human consumption) and system pressure city-wide;
- Address updated federal regulations that require more robust security for water infrastructure; and
- Maintain the City's ability to store a large amount of water locally, which is a key element of Santa Barbara's strategy to remain resilient and resistant to local emergencies or other climate change-related issues (e.g., drought, storms, wildfires).

2.6 Project Characteristics

The proposed Project includes the following main elements:

- **Vic Trace Reservoir Parcel Improvements:** Replacement of the existing 10 MG Vic Trace Reservoir with two 5 MG reservoirs at the same site, re-abandonment of the abandoned oil well, building replacements, earthwork, and site improvements on the parcel, including possible renewable energy generation and storage.
- Offsite Improvements:
  - **Underground Water Mains:** Replacements, repairs, abandonments, and relocations of aging water mains in neighborhood areas near the Vic Trace Reservoir parcel.
  - **Underground PRV Station Relocation**: Relocation of the reservoir's downstream PRV station to an improved location with safer entry.
  - **Construction Offices**: Use of a City-owned single-family residential property for temporary construction offices for safer and more accessible neighbor engagement with Project personnel.

Project elements are described in detail in the following sections. Figure 2-10 shows the proposed overall site plan for the Vic Trace Reservoir parcel. Figure 2-11 shows the proposed landscape plan. Figure 2-12 and Figure 2-13 show visual renderings of the proposed Project improvements (at preliminary design phase) on the Vic Trace Reservoir parcel.

2.6.1 Vic Trace Reservoir Parcel Improvements

Vic Trace Reservoir Replacement

The proposed Project would demolish the existing 10 MG Vic Trace Reservoir and construct two identical, circular, prestressed concrete 5 MG reservoirs, shifted 30 feet northeast of the current reservoir's centerline and completely buried with 1.5 feet of cover. The installation of two reservoirs, rather than a single 10 MG reservoir, would provide the City with greater operational flexibility by allowing one reservoir to be taken offline for maintenance or seasonal cycling while maintaining uninterrupted service. This approach enhances water quality by reducing water age and improving turnover within the storage system.

Due to the slope of the reservoir area, the northwest- and southwest-facing sides of the reservoir area would be exposed with support from retaining walls, creating a lower terrace. The retaining walls would be approximately five to fifteen feet in height. The site's existing top (highest) ground surface would be lowered from its existing 465 feet above sea level to 463 feet above sea level.

The new reservoirs would each have an inside diameter of 206 feet and a side water depth of approximately 20 feet. The roofs would be column-supported conventionally reinforced flat slab. Following reservoir construction, backfill would be placed against the walls. The tops of both reservoirs would be covered with permeable finished surfaces (e.g., aggregate base or gravel).

Reservoir design and construction is governed by multiple codes and consensus standards, including the latest versions of the California Building Code and International Building Code, California Code of Regulations (Title 17 and 22), and American Water Works Association (AWWA) Standards.

The two new reservoirs would be separated by approximately 20 feet to provide sufficient space for the construction of inlet and outlet pipelines between the two reservoirs. Separate inlet and outlet pipelines would be installed on opposite sides of the reservoirs to minimize short-circuiting and stagnation of the water flow. Inlet, outlet, overflow, and drain pipelines would consist of cement mortar lined and coated welded steel pipes. The inlet and outlet pipelines would be equipped with isolation valves allowing removal of one or both reservoirs from service for repairs and maintenance.

Access to reservoir valves would be through two cast-in-place concrete vault structures, completely buried, except for hatches at the ground surface for personnel access to the staircases and for valve/equipment access. The proposed valve vaults would conform to modern Occupational Health and Safety Administration (OSHA) standards and would provide safer and more ergonomic access for operators in comparison to existing conditions.

- The Inlet Valve Vault would be located southeast and centered between the two reservoirs, and would be approximately 24 feet long, 24 feet wide, and 38 feet deep.
- The Outlet Valve Vault would be located northwest and centered between the two reservoirs, and would be approximately 28 feet long, 24 feet wide, and 28 feet deep.

Proposed appurtenances for each vault would include roof vents, interior staircases, two access hatches on the roof (one for personnel entry and one for equipment), and guardrails around each roof hatch. Additional appurtenances may also be proposed for remote reservoir monitoring and water quality equipment.

The proposed Project would also install a replacement 8-inch water pipeline with adequate pressure for reservoir washdown water, fire hydrants, and irrigation. This replacement reservoir overflow and drain pipeline would operate similar to existing conditions, discharging water through the property via a replaced 30-inch pipeline to an existing storm drain manhole at La Coronilla Park, which connects to an existing to an underground City storm drain system along Dolores Drive.

Site Access

A new 24-foot-wide asphalt concrete paved access road would be constructed from La Coronilla Drive to the top of the reservoir site to facilitate large vehicles and two-way traffic under normal operations. The improved access road would be located approximately over the existing access road alignment.

As shown in the visual renderings in Figure 2-13, one 30-foot-wide manual swinging wrought iron gate would be located along this access road, just before the paved area widens for parking, turnaround, and access to the proposed Valve Building. Approximately 160 feet southwest of the newly proposed site entrance gate, a second 30-foot-wide manual swinging wrought iron gate would be located next to the replaced La Coronilla Pump Station and Valve Building, and would limit access to the reservoirs to only City personnel. From this second gate, a proposed 24-foot-wide paved reservoir access road would provide access to the top of the reservoir site. A smaller, paved area would be provided near the northeastern tank for fire truck access and turn-around. Access roads and turnaround areas would comply with all applicable City of Santa Barbara Fire Department standards.

Approximately halfway up the paved access road, another new paved road would extend to the terraced area. The Project would also construct a new 12-foot-wide site perimeter road, with a finished surface of turf block or similar for the purposes of perimeter site access for landscaping, maintenance, fire and safety personnel, and for driving access for third party utility maintenance (e.g., Southern California Edison).

Construction access is described in Section 2.7.5, Construction Staging and Traffic.

Security

The site entrance vehicle gate would be equipped with controlled access for City staff. The two new gates would have manual locks and Knox boxes for fire access, and would be equipped with security surveillance. All new structures would have keyed or card reader exterior door access.

The proposed Project would remove all unauthorized pedestrian gates installed by private property owners within the existing perimeter fencing. The Project would replace or maintain existing fencing and install new fencing to enclose the entire perimeter of the site. New fencing visible from the ROW along Dolores Drive would be Shepherd hook configuration of uniform height, and new fencing not visible from the ROW or other public viewing areas would be either Shepherd hook or chain-link.

Re-abandoned Oil Well

The Project would re-abandon to current standards the existing abandoned oil well onsite underneath the north-east corner of the Vic Trace Reservoir. Due to the oil well's location under the existing reservoir, its current top of casing elevation is unknown. The Project would locate the existing oil well, and cut and cap the oil well casing to an elevation lower than the new reservoir concrete floor prior to installation of the new reservoir. The Project would also install a new cement

plug from the top of the cut casing to approximately 75 ft deep. Re-abandonment procedures would be in coordination and compliance with the State of California's Department of Conservation, Geologic Energy Management Division (CalGEM).

Replaced Valve Building

The Project would demolish the existing Valve Building near the site entrance driveway. A new 2,200-square foot concrete Valve Building with a metal deck roof would be constructed. The new Valve Building would house the control valves, booster pumps ("La Coronilla Pump Station"), hypochlorite disinfection system, electrical and remote monitoring equipment, and a restroom. Space adjacent to the Valve Building would be allocated for a hydropneumatic tank and standby generator.

The standby generator would consist of a diesel engine-driven generator rated 480V, 3-phase, 60-hertz (Hz), 0.8 power factor, 250 kilowatt (kW). The generator would be installed in a sound-attenuating weatherproof enclosure adjacent to the proposed Valve Building. An aboveground fuel tank would be provided on the same pad as the generator set. The fuel tank would have a double wall and a leak detection device.

All metal vessels used as hydropneumatic tanks must be constructed to American Society of Mechanical Engineers (ASME) standards, including maximum operating pressure and minimum wall thickness.

Renewable Energy

The Project may involve construction of renewable energy generation and storage equipment to sustainably power the replaced valve building and pumps. If installed, a photovoltaic (PV) solar energy generation system would be 60 kilowatts (kW) and would power the onsite electrical facilities at a minimum. A 60 kW system equates to approximately 4,500 square feet of solar panels that would either be installed on top of the reservoir area and/or on south-west facing hillslopes to maximize solar generation. The solar system would consist of solar panels, wiring and conduits, an inverter, electrical meter and possible battery storage. A battery energy storage system to store energy produced by the solar system would be installed near the Valve Building and would be approximately 1,100 kilowatt-hours (kWh) in capacity.

Relocated Communications/IT Building and Antennas

The existing Communications/IT Building would be protected in place. The majority of the existing antenna towers would be demolished and some antenna towers and pedestals would be rebuilt, relocated, or modified on-site. The total number of antenna towers would not increase as compared to existing conditions. Tower heights may increase as compared to existing conditions but would not exceed 65 feet, the Santa Barbara Municipal Code (SBMC) height limit for antennas serving emergency communications located in residential areas (SBMC Section 30.185.410.C.1a). The IT building is equipped with an existing 50 kW diesel generator, which is designed to store approximately 50 gallons of diesel fuel.

Terraced Area

Portions of the Vic Trace Reservoir parcel to the northwest and southwest sides of the new reservoirs would be graded to create approximately 7,000 square feet of terraced areas with retaining walls for storage and laydown of materials, staging for repairs and replacement, and

ongoing operations and maintenance needs, necessitating the export of approximately 83,000 cubic yards of soil.[2] The terraced area would be covered with pervious materials and an asphalt impervious access road for fire personnel access.

Landscaping

Figure 2-11 shows the proposed landscape plan. Existing plants and trees within the development footprint would be removed prior to grading and excavation. Vegetation removal would include up to approximately 55 trees, including approximately seven coast live oaks. All removed trees would be replaced on the Vic Trace parcel.

Following the completion of construction, new drought-tolerant and fire-resistant landscaping would be installed. The proposed plant palette would consist of a mix of California native shrubs and trees, and would require no irrigation once plants are established, as well as minimal maintenance activities. All proposed plant species would comply with the City of Santa Barbara's Fire Department Fuel Modification requirements (SBMC Section 8.04), as well as the State of California's Model Water Efficient Landscape Ordinance. Landscaping would comply with Santa Barbara's Water Efficient Landscape Standards (SMBC Section 14.23.005).

Stormwater

The Project would install stormwater best management practices (BMPs) on the Vic Trace Reservoir parcel. Much of the parcel would remain pervious, and stormwater flows are expected to infiltrate or match existing surface flow patterns. Grading and drainage would be configured to encourage slowing and infiltrating stormwater on-site. Storm drain piping would be installed on-site to convey water to stormwater BMPs and storage areas.

The site perimeter road would be sloped back into the hillside, directing water to a vegetated swale. On the southern portion of the parcel, stormwater flows would be directed to a stormwater storage area situated on the western portion of the parcel. Excess flows would enter the storm drain system offsite. The Project would comply with the City's Storm Water BMP Technical Guidance Manual adopted in 2020 and would comply with Tier 4 requirements.

Lighting

Lighting on the Vic Trace Reservoir site would be similar to existing conditions. Lighting would be located at the new building and would comply with the City's Outdoor Lighting Ordinance (SBMC Section 22.75) and Outdoor Lighting Design Guidelines. Consistent with existing conditions, lighting would only be turned on for safety during occasional nighttime maintenance and repair work.

La Coronilla Park

The only improvements proposed at La Coronilla Park are minor upgrades to the existing reservoir pipeline infrastructure. All improvements would be underground, and disturbed areas would be restored to pre-Project conditions following construction activities in the park. Temporary construction equipment access may be provided through the park to access the construction site. It is anticipated public access to La Coronilla Park would be unavailable for up to approximately one month during Project construction.

[2] This number represents a conservative estimate and is expected to be substantially reduced through ongoing design efforts.

2.6.2 Offsite Improvements

Relocated La Coronilla Transmission Main

The proposed Project would abandon in-place a portion of the existing 24-inch water transmission main that conveys finished drinking water from the City's Cater Water Treatment Plant to the Vic Trace Reservoir, located within a City utility easement in the backyards of single-family residences that front La Coronilla Drive. Minor aboveground appurtenances (e.g., valve cans) would remain in place. The existing pipeline would be cut and capped in place from the public ROW. No ground disturbing activities would occur associated with the abandonment, and no work would be required outside of the public ROW.

The Project would also install a new, relocated 24-inch water transmission main within La Coronilla Drive ROW, between Meigs Road and the proposed Valve Building at the Vic Trace Reservoir site. Unless provided a waiver from California Division of Drinking Water separation requirements between water and sewer mains, approximately 150 linear feet of the 24-inch water transmission main along La Coronilla Drive may be installed under existing concrete driveways and sidewalks within the public ROW to meet water and sewer pipeline separation requirements. Portions of existing concrete sidewalks and driveways disturbed by the Project would be replaced to match existing grades as required by the new alignment.

Replaced Vic Trace Outlet Main

The Project would install a new reservoir outlet main, consisting of a 12- or 16-inch pipeline that would exit the Vic Trace Reservoir towards the parcel's entrance on La Coronilla Drive, head north along La Coronilla Drive and then turn south along Dolores Drive to the new PRV station located at the intersection of Meigs Road and Dolores Drive. At the PRV, the pipeline would turn south along Meigs Road and reconnect to an existing water main at the intersection of Meigs Road and Red Rose Way. The new reservoir outlet main would convey water from the Vic Trace Reservoir to the new PRV station, where water pressure would be reduced. Construction activities would occur within the Vic Trace Reservoir parcel, Dolores Drive, and Meigs Road and La Coronilla Drive ROWs.

Replaced Dolores Drive Main

The Project would abandon in place or remove the existing, aging, cast iron 8-inch water main within Dolores Drive and replace it with a new water main of the same size and capacity. Replacement of the water main would minimize future possible service disruptions and emergency shutdowns from water infrastructure failure. Construction would include the reconnection of existing service lines from the existing main to the new main, and all construction activities would occur within the Dolores Drive ROW.

New Ricardo Avenue Main

The Project would also install a new water main along Ricardo Avenue. It would connect to the proposed discharge main at the intersection of Ricardo Avenue and Dolores Drive and traverse along Ricardo Avenue to La Vista Del Oceano Drive. Construction activities would occur within the Ricardo Avenue ROW.

Entry/Exit Pits for La Vista Del Oceano Pipeline Lining

An existing underground Vic Trace Reservoir Outlet Main runs south from the Vic Trace Reservoir site to the existing PRV on La Vista Del Oceano Drive. The northern portion of the pipeline, running from the Vic Trace Reservoir site to Ricardo Avenue, would be abandoned in place. No ground disturbance would be required. The southern portion of the pipeline, which extends from Ricardo Avenue to the existing PRV on La Vista Del Oceano Drive, would be rehabilitated through trenchless relining. Two lining pits would be temporarily excavated within the public ROWs on Ricardo Avenue and La Vista Del Oceano Drive. No ground disturbance is proposed outside the public ROWs. Relining construction activities are detailed in Section 2.7.3, Pipeline Abandonment, Rehabilitation, and Construction.

Existing PRV (to be abandoned)

PRV stations convey and regulate water between zones of different water pressure across the City. The existing La Vista Del Oceano PRV station provides a critical flow path between pressure zones. The existing PRV station does not meet current Occupational Safety and Health Administration (OSHA) personnel safety standards. The proposed Project would abandon the existing La Vista Del Oceano PRV station located at the intersection of Cliff Drive and La Vista Del Oceano.

Proposed PRV Station (to be constructed)

The Project would construct a new PRV underground within the Dolores Drive ROW, on the southern sidewalk approximately 80 feet east of the intersection of Meigs Road and Dolores Drive, east of an existing stormwater drop inlet facility. The approximate dimensions of the PRV station would be 16 feet by 8 feet. This PRV would replace the existing La Vista Del Oceano PRV to be abandoned and described above. A temporary construction easement may be required to construct the PRV, as equipment may require adjacent staging space on private property to the south.

Temporary Construction Offices

The Project would locate temporary construction offices for Project personnel at 1633 La Coronilla Drive, a single-family residential use owned by the City of Santa Barbara. The home is in close proximity to the site and would serve as a coordination hub for personnel, improving safety, access, and neighbor engagement. Upon Project completion, the home would no longer be used for construction offices.

No ground-disturbing activities are anticipated at this property and use would generally be limited to Project working hours (7:00 am. to 5:00 p.m.). Some after-hours use of the home may be needed to oversee any construction work proposed after hours, which will be approved and noticed in advance of work. Project personnel parking would be on the Vic Trace Reservoir Parcel to make the 1633 La Coronilla driveway accessible for pedestrian access.

2.7 Project Construction

2.7.1 Construction Schedule

Construction activities would generally occur from 7:00 A.M. to 5:00 P.M., Monday through Friday. While the majority of construction would occur during daytime hours and weekdays, occasional nighttime or weekend activities may be required to minimize water outages.

Construction of the proposed Project is expected to occur over approximately three years, anticipated to begin approximately July 2028 to end by August 2031. Table 2-2 provides the estimated construction durations. Project activities may occur concurrently.

Table 2-2 Project Construction Schedule

Activity	Duration
Vic Trace Reservoir Shutdown, Drainage, and Demolition	4 months
Oil Well Re-abandonment	6 months
New Reservoir Construction	16.5 months
Vic Trace Reservoir Site Improvements	19.5 months
On and offsite Pipeline Construction	5.5 months
PRV Station Relocation	3.5 months

2.7.2 Vic Trace Reservoir Parcel Construction Activities

The Project would shut down, drain, and demolish the existing Vic Trace Reservoir. Project demolition would include the entire existing Vic Trace Reservoir, appurtenant piping, pavement, and reservoir fencing; the existing Valve Building, hydro-pneumatic tank, disinfection facilities, generator, and aboveground fuel tank; asphalt pavement and curb and gutter along La Coronilla Drive at the site entrance; the existing entrance access road from the Valve Building to the reservoir pad; all existing on-site utilities; and most existing on-site vegetation.

Table 2-3 identifies anticipated Project demolition debris quantities associated with demolition of the existing Vic Trace Reservoir. Haul routes and disposal are discussed in Section 2.7.5, Construction Staging and Traffic.

Table 2-3 Anticipated Project Demolition Debris Quantities

Material	Volume (cubic yards)	Weight (tons)
Concrete	2,010	4,223
Steel	29	194

Project construction activities would include grading the site, re-abandoning the oil well, constructing two 5 MG reservoirs, constructing retaining walls to create terraced areas, and constructing the Valve Building. The terraced areas would be used for staging and laydown during construction, and for other water operations and maintenance uses during the reservoir's ongoing operation.

The major elements of construction for prestressed concrete reservoir tanks include the tank floor, footings and columns, wall sections, and the roof. Approximately 6,450 cubic yards of concrete would be required for reservoir construction.

Temporary Water Storage

Temporary water storage at the Vic Trace Reservoir during construction activities would not be required, as the City will have sufficient offsite storage elsewhere in the water system by the start of the Project to accommodate the construction duration. This was confirmed by hydraulic analysis performed for the City's Water Distribution Infrastructure Plan in 2019 and confirmed again in 2025.

2.7.3 Pipeline Abandonment, Rehabilitation, and Construction

La Coronilla Transmission Main Abandonment

The existing La Coronilla Transmission Main to be abandoned would be cut and capped with a welded on blind flange or plate. No ground disturbing activities would be required for the abandonment. Minor aboveground appurtenances (e.g., valve cans) would remain in place.

Existing Vic Trace Outlet Main Abandonment and Rehabilitation

The existing Vic Trace Outlet Main would be partially abandoned and partially rehabilitated as part of the La Vista Del Oceano Pipeline Lining portion of the Project. The following sections outline the abandonment and rehabilitation activities:

- **Northern Segment Abandonment (Existing Vic Trace Outlet Main):** The northern segment would be abandoned in place. No ground disturbance would be required for this portion, and the pipeline would be cut and capped at its terminus near Ricardo Avenue.
- **Southern Section Rehabilitation (La Vista Del Oceano Pipeline Lining – Entry and Exit Pits):** The southern segment would be rehabilitated using trenchless relining methods. Construction would begin with the excavation of an approximately 6-foot by 10-foot by 6-foot-deep entry pit within the Ricardo Avenue ROW to expose the existing pipeline. A corresponding exit pit, approximately 6 feet by 10 feet by 8 feet deep, would be excavated near 1532 La Vista Del Oceano on the western side of the roadway, either within the ROW or an existing utility easement. From the entry pit, a liner would be installed heading south through the existing pipeline alignment towards the exit pit. Upon completion of the relining process, custom fittings would be installed within the trench, followed by backfilling and repaving of the disturbed roadway surface. Final restoration would include installation of fittings, backfilling, repaving, and/or replanting, as appropriate.

New, Replaced, and Relocated Pipelines

The Relocated La Coronilla Transmission Main, New Vic Trace Outlet Main, Replaced Dolores Drive Main, and New Ricardo Avenue Main would be constructed using open-cut trench methods. Open-cut trench pipeline installation typically consists of trench excavation (including saw cutting of pavement where applicable), removal of pipeline, pipe bedding stabilization, pipe installation, and backfill. The construction crew would typically operate a backhoe and/or excavator, compaction equipment (attachment on an excavator and hand-operated equipment), dump trucks for stockpiling of soils and delivery of backfill material, utility trucks (with truck-mounted or towed generator and hand tools), and water trucks/water buffalos.

Pipeline construction would progress in a linear manner along each alignment, with an estimated average installation rate of approximately 75 feet per day. Generally, trench spoils would be temporarily stockpiled within the working area adjacent to the pipeline trench or on the Vic Trace Reservoir parcel.

2.7.4 PRV Station Abandonment and Construction

PRV station abandonment activities would be limited to valve replacement within the existing PRV; no excavation would be required, as the valve can be replaced using existing manhole entrances and mechanical tools.

Construction of the new, relocated PRV station at Dolores Drive and Meigs Road would involve excavation, installation of the vault and equipment, and backfilling. First, a hole would be excavated (18 feet long by 10 feet wide by 8 feet deep) to accommodate the new vault (16 feet by 8 feet) with the top of the vault and hatches at grade. The utility vault would either be cast in place or pre-cast. If pre-cast, the vault would be installed with a small crane. The vault would contain water appurtenances such as pipelines, valves, a sump pump, and remote water monitoring equipment, and would be connected to electrical power.

Aboveground features at the new PRV station are expected to include bollards, a programmable logic controller (PLC) panel, a separate Southern California Edison (SCE) electrical service enclosure, and a low-profile antenna for Supervisory Control and Data Acquisition (SCADA) communications. These components would be installed adjacent to the underground vault, with all electrical connections routed underground to a nearby overhead power pole at the intersection of Dolores Drive and Meigs Road. Additional visible elements may include at-grade access hatches and small vent pipes, consistent with other PRV installations throughout the City. Additional underground pipelines would be constructed to connect the PRV station to existing pipelines within the ROW.

2.7.5 Construction Staging and Traffic

Staging and Laydown

Construction staging and laydown would occur on the Vic Trace Reservoir parcel. Equipment and office trailers may be staged near the existing Valve Building.

Construction Traffic

Consistent with City Transportation Division requirements, construction-related truck trips would be scheduled during working hours (7:00 a.m. to 5:00 p.m.). While the majority of construction would occur during daytime hours and weekdays, occasional nighttime or weekend construction traffic may be required to minimize water outages or to accommodate concrete pouring activities.

Across the anticipated five-week demolition phase, approximately 224 two-way truck trips are estimated for removal of concrete and steel, or approximately eight to 10 per day.

Across the anticipated four-month excavation and site grading phase, approximately 9,230 two-way truck trips are estimated for removal of soil, or approximately 100 to 110 per day.

Across the Project construction period, approximately 1,440 two-way truck trips are estimated for delivery of concrete. Assuming this is spread over 100 working days, this yields approximately 14 truck trips per day.[3]

At least 1,600 worker trips are anticipated throughout the entire construction period. Assuming approximately 200 working days in total, this yields approximately 8 worker trips per day.[4]

Demolition and other debris would likely be hauled to the South Coast Recycling & Transfer Station (4430 Calle Real, Goleta), which would direct trash to the Tajiguas Landfill (14470 Calle Real, Goleta). The haul route would likely proceed northwest from the Project site along La Coronilla Drive, with a right turn on West Carrillo Street and northeast towards US-101 North. Diverted materials would be separated and transported to appropriate regional recycling facilities depending on material type. Concrete and masonry materials could be delivered to permitted construction and demolition

[3] These numbers represent a conservative estimate and they are expected to be substantially reduced through ongoing design efforts.
[4] Truck trip calculations assume the use of vehicles and equipment smaller than a WB-50 truck (i.e., trucks less than 50 feet in length).

recycling or aggregate recovery facilities such as Granite Construction, Lash Construction, or the MarBorg Construction & Demolition Recycling Facility (119 North Quarantina Street, Santa Barbara), where clean concrete and rubble are accepted for crushing and reuse as recycled aggregate. Structural steel and rebar could be hauled to licensed scrap metal recyclers such as Santa Barbara Iron & Metal Recyclers (709 East Gutierrez Street, Santa Barbara) or similar facilities operating within Santa Barbara County that accept construction-generated steel for recycling.

Construction traffic, including haul trucks and construction worker vehicles, would access the Project site via two potential routes: La Coronilla Drive, via West Carrillo Street/Meigs Road to United States Highway 101; or Dolores Drive, via Meigs Road and Cliff Drive to United States Highway 101.

All staging and personnel parking would occur on-site at the Vic Trace Reservoir parcel.

Traffic Controls

Signage and flagger controls would be implemented within various roadways across the Project site. Traffic control at the intersection of Meigs Road and Cliff Drive would include signs advising drivers of trucks entering and exiting Dolores Drive.

The City would engage in community outreach to notify the neighborhood of anticipated road closures and construction activities. Notifications may include, but are not limited to, social media posts, mailers, signs, and/or emails to interested parties and neighbors. The City would also coordinate directly with adjacent property owners to notify them of daily roadway access and parking restrictions.

2.8 Operation and Maintenance

Upon completion of construction activities, regular operation, maintenance, and IT activities at the Vic Trace Reservoir parcel would resume and would be similar to existing conditions. Compared to existing conditions, electricity consumption would increase by approximately 70,000 kWh per year to power the replaced La Coronilla Pump Station and new security systems not currently in place. Electricity consumed by the project would be generated either off-site or from renewable sources located on-site.

In the event any Project component is compromised during operation, the City would conduct emergency repairs as soon as possible; emergency response and repairs are part of the City's normal operations to maintain system integrity and reliability and are not a new or increased activity associated with the Project.

2.9 Summary of Potentially Required Approvals

Table 2-4 lists the anticipated permits and discretionary approvals that may be required for Project-related activities. One of the purposes of this Draft EIR is to provide these agencies with information to support the agency permitting process. Table 2-4 also lists the types of activities that would be subject to these requirements.

Table 2-4 Summary of Potentially Required Permits/Approvals

Regulating Agency	Potential Permit/Approval	Reason for Permit/Approval
Central Coast Regional Water Quality Control Board	National Pollutant Discharge Elimination System (NPDES) Stormwater Construction General Permit	Construction activities resulting in ground disturbance exceeding one acre
City of Santa Barbara	Encroachment Permit	Pipeline construction within City rights-of-way
	Tree Removal Permit	Removal of trees
	Conditional Use Approval	City project requiring discretionary review
	Public Works Permit	Traffic control and haul routes during construction
	Building Permit	Compliance with building and safety codes
	Grading Permit	Site grading
Santa Barbara County Air Pollution Control District	Authority to Construct (ATC)/Permit to Operate (PTO)	Generator installation and operation
Santa Barbara County Public Health Department, Environmental Health Services Division	Soil Management Plan approval	Possible excavation of oil contaminated soils from existing abandoned oil well
Division of Drinking Water Santa Barbara District	Water Supply Permit amendment	Changes to a water supply source, storage, treatment, or for the operation of new water system components
California Department of Conservation, Geologic Energy Management Division	Oil Well Re-abandonment Permit	Construction activities resulting in the partial removal of existing abandoned oil well
Southern California Edison	Project Permit Temporary Power Service	Consolidation, modification, and relocation of electrical services, temporary service during construction
Frontier Communications	Project Permit	Modification and relocation of cable communication service

3 Environmental Setting

This chapter provides a general overview of the environmental setting for the proposed Project. More detailed descriptions of the environmental setting for each environmental issue area can be found in Chapter 4, *Environmental Impact Analysis*.

3.1 Regional Setting

The Project site is located in the Santa Barbara coastal region. Santa Barbara is situated between the Santa Ynez Mountains to the north and the Pacific Ocean to the south. The area is characterized by rolling foothills, coastal sage scrub, oak woodlands, riparian corridors, and sandy beaches. Tectonic uplift in the region has led to the formation of coastal bluffs and marine terraces. While portions of the Santa Barbara area remain semi-rural, with land uses including open space, recreation, and limited agriculture, much of the area is urbanized, including the city of Santa Barbara and surrounding communities.

Major roadways in Santa Barbara include State Street, Cabrillo Boulevard, Cliff Drive, and Las Positas Road. The closest freeway is United States Highway 101 (U.S. 101), which runs through the City and provides regional connectivity along the coast. Hydrologic features in the Santa Barbara area include Mission Creek, Arroyo Burro, Sycamore Creek, and Laguna Creek, among others. These creeks generally drain southward toward the Pacific Ocean, with some contributing to wetland habitats near the coast.

Santa Barbara's Mediterranean climate is typified by warm, dry summers and mild, wet winters, with most precipitation occurring between November and March. The area receives approximately 18 to 20 inches of rainfall annually on average, and is influenced by coastal breezes that typically flow from the ocean inland.

3.2 Project Site Setting

The Project site includes both the Vic Trace Reservoir parcel (site), City-owned home at 1633 La Coronilla Drive and off-site improvements. The Project site is situated in the Alta Mesa residential neighborhood, where the neighborhood consists of single-family residences and a church. Residential land uses surround the Vic Trace Reservoir parcel to the north, south, east, and west. Commercial land uses straddle the portion of pipeline alignment traversing Meigs Road.

The site covers approximately 15 acres and contains Lavigia Hill. The peak of Lavigia Hill sits approximately 460 feet above sea level, 50 feet higher than the site entrance at La Coronilla Drive. The site hosts existing City-owned infrastructure facilities, including the existing Vic Trace Reservoir, valve building, telecommunications facilities, and an abandoned oil well. Refer to Chapter 2, *Project Description*, Section 2.4, *Existing Site Characteristics*, for further information. One ingress and egress driveway provides access to the site. A one-lane, 20-foot wide paved road runs from La Coronilla Drive southward up Lavigia Hill to the existing reservoir and telecommunication facilities. An unpaved approximately 8-foot wide access road continues intermittently around the perimeter of the reservoir. A combination of chain link and shepherds hook fencing (5 to 8 feet tall) surround the perimeter of the property (with the exception of La Coronilla Park). A second internal chain link fence (7 feet tall) encloses the reservoir roof area. A locked, chain link security gate is located at the

property entrance. The western portion of the site also contains La Coronilla Park, an undeveloped, vegetated neighborhood park situated between 726 and 812 Dolores Drive.

Other than the developments described above, the remainder of the site is generally undeveloped with vegetation communities such as grassland, coast live oak woodland, eucalyptus grove, sagebrush, and ice plant mats. The parcel is regularly mowed and vegetation is maintained for fire suppression. Unauthorized pedestrian gates have been installed by private property owners along the perimeter fencing.

Offsite of the Vic Trace Reservoir parcel, the existing pipelines and the existing La Vista Del Oceano Pressure Reducing Valve (PRV) station are located underground in paved roadways in the Alta Mesa residential neighborhood surrounding the Vic Trace Reservoir site. PRV stations convey and regulate water between zones of different water pressure across the city. The proposed PRV station relocation site is located on undeveloped land in public right-of-way, in between a paved curb, sidewalk and a fenced private property.

A single-family residence adjacent to the Project site is proposed for temporary Project construction offices and personnel activities. The home is located at 1633 La Coronilla Drive to the north-east of the site entrance and is owned by the City of Santa Barbara. The home's proximity to the Project site and its accessibility for neighborhood pedestrian access will allow Project personnel to engage safely and directly with the nearby community.

3.3 Cumulative Development

A project's cumulative impacts are the possible environmental effects that are individually limited but cumulatively considerable. Section 15065[a][3]) of the *CEQA Guidelines* states that:

> *"Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects. Section 15355 of the CEQA Guidelines states that: "Cumulative impacts" refers to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts:*
>
> *a. The individual effects may be changes resulting from a single project or a number of separate projects.*
>
> *b. The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.*

According to Section 15130 of the *CEQA Guidelines*, the discussion of cumulative impacts must reflect the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great of detail as is provided for the effects attributable to the project alone. The discussion should be guided by standards of practicality and reasonableness and should focus on the cumulative impact to which the identified other projects contribute rather than the attributes of other projects that do not contribute to the cumulative impact. Impacts that do not result in part from the project evaluated in an Environmental Impact Report (EIR) need not be discussed.

The impact subsections of Chapter 4 of this EIR discuss the potential cumulative environmental impacts resulting from the Project in association with other planned, pending, and reasonably foreseeable projects in the vicinity of the Project area. The list of cumulative projects considered in this analysis was based on planned, pending, and reasonably foreseeable projects at the time of the Notice of Preparation in November 2025.

Table 3-1 lists the planned, pending, and reasonably foreseeable projects considered for the purposes of the cumulative analyses within this EIR. These projects are located within the city of Santa Barbara and include multi-unit housing projects within 0.75 mile of the Project site (i.e., the Alta Mesa neighborhood),[1] major project proposals,[2] building permits for single-family residences within 0.75 mile of the Project site,[3] City projects in design or under construction,[4] and accessory dwelling unit constructions within 0.75 mile of the Project site.[5]

The cumulative analyses consider projects in the city of Santa Barbara, as these projects share the same jurisdiction and are subject to the same local planning and regulatory frameworks. However, individual cumulative analyses within each impact subsection of Chapter 4 also define the appropriate geographic scope considered within the analysis. Each cumulative project considered within this EIR has, at a minimum, begun the process of completing a development application.

Table 3-1 Cumulative Projects List

Project Name	Project Location	Description	Status
City of Santa Barbara			
City of Santa Barbara Infrastructure Projects			
Cliff Drive Vision Zero Project	Cliff Drive from Arroyo Burro County Park to Castillo Street	Construction of a new three-mile separated biking and walking path, including fourteen new crosswalks, four new traffic signals, and accessibility improvements.	In Design
Westside and Lower West Neighborhoods Transportation Management Plan Implementation Project	Adjacent to La Cumbre Jr. High and Santa Barbara Community Academy; Westside and Lower West Neighborhoods	Construction of a one-mile Class IV bike path; bike lanes and bike boulevard features, sidewalk infill on six streets, safety enhancements at 15 crosswalks, and pedestrian-scale sidewalk lighting along San Andres Street.	In Design
Watermain Transmission Main Renewal Project (Phase 2)	Various locations	Maintenance and repair project to fix portions of the City's transmission pipeline in the greater Las Positas and Westside areas.	In-Design
De La Guerra Plaza Revitalization Project	735 Anacapa Street	Improvements to the existing De La Guerra Plaza making it a primarily pedestrian Plaza which would function as a civic center. Proposed improvements include raising the road, new landscaping, new surface materials throughout, an interactive water feature, restrooms, a new multi-use building/pavilion, multiple public art locations, new lighting, new water mains and improvements to existing utility connections, a vehicular parking lot and consolidated underground trash/ recycling.	In Design
Ortega Park Revitalization Project	604 East Ortega Street	Revitalization of Ortega Park, including public art, improved aquatics facilities, dedicated community gathering areas, a revitalized play space, an improved basketball court, a skate/multi-wheel park, and a sports field that could be used year-round.	In Design
Milpas Street Crosswalk Safety and Sidewalk Widening Project	Milpas Street	New curb extensions, high visibility crosswalks, additional lighting, accessibility improvements, widened sidewalks at street corners and transit stops, leading pedestrian intervals at signalized intersections, mast arm mounted Rectangular Rapid Flashing Beacons, and a median refuge island at one non-signalized intersection	In Design
Flood Mitigation and Capacity Improvements for Sycamore Creek Project	Sycamore Creek	Construction or enhancement of retention basins, green infrastructure, storm drains, and natural drainage systems to better manage storm water runoff and reduce peak flow rates during heavy rains. Restoration of natural floodplain areas and riparian buffers to improve water absorption and infiltration, reducing runoff velocities and peak flow rates.	In Design
Los Patos Underpass Removal Project	Los Patos Way, directly off the southbound Exit 95 from U.S. Highway 101	Removal of the Los Patos Way Off-Ramp Underpass (Los Patos Underpass), Bridge No. 51-0235, and the construction of a shoofly (rail bypass) to allow continued train travel during the construction of a new rail bridge over Cabrillo Boulevard.	In Design

Project Name	Project Location	Description	Status
Fiscal Year 2023 Water Main Replacement Project	Lucinda Lane to Alamar Avenue; State Street between Junipero and Valerio	Standard trench replacement of approximately four miles of aging and at-risk potable water main pipes.	Under Construction
Cliff Drive Water Main Replacement Project	Cliff Drive from Las Positas to La Marina and Meigs Rd from Dolores Drive to Lighthouse	Standard trench replacement of approximately three miles of aging and at-risk potable water main pipes.	Under Construction
De La Vina Street Bridge Replacement Project at Mission Creek	Intersection of De La Vina Street and Vernon Road	Replacement of the existing bridge over Mission Creek, including curb extensions, high-visibility crosswalk markings, and rectangular rapid flashing beacons to improve pedestrian safety and access.	Under Construction
Via Lucero Wastewater Forcemain Replacement Project	Via Lucero Road	Replacement of wastewater forcemain and replacement of gravity sewer main, including installation of a new Via Lucero Lift Station metering vault and abandonment of existing forcemain.	Under Construction
Cater Resiliency Project	Cater Water Treatment Plant San Roque Rd	Replacement and upsizing of the Clearwell and chlorine contact basin at Cater Water Treatment Plant for resiliency	Under Construction
Watermain Transmission Main Renewal Project (Phase 1)	Various locations	Maintenance and repair project to fix portions of the City's transmission pipeline in the greater Mission Canyon area.	Under Construction
Santa Barbara Police Station Project	215 East Figueroa Street	Demolition of an existing parking lot and construction of a new three-story, approximately 53-foot-high, approximately 64,000-square-foot Police Station building, and associated 37.5-foot-high, approximately 84,000-square-foot parking structure to accommodate 236 parking spaces.	Under Construction
Fiscal Year 2022B Pavement Maintenance (Overlay) Project	Anacapa Street from Gutierrez Street to Cota Street	Grinding off deteriorated asphalt pavement and overlaying with new asphalt on various high-priority streets throughout the city; construction of concrete improvements including pedestrian access ramps for compliance with the Americans with Disabilities Act (ADA), bicycle safety improvements, repair of damaged sidewalks, repair of curbs and gutters, and traffic signal upgrades.	Under Construction
El Estero Water Resource Center Electrical Distribution Renewal Project	520 East Yanonali Street	Replacement of the aging electrical distribution system at the El Estero Water Resource Center, including demolition of four buildings, including all electrical equipment contained therein, and construction of five new electrical buildings, a new waste gas flare, and storm water system upgrades.	Under Construction
East Beach Habitat Restoration Project	East Beach	Rehabilitation of a 1.1-acre area of beach by removing invasive, non-native ice plant and reintroducing native coastal dune species.	Under Construction
Dwight Murphy Field Master Plan	501 Ninos Drive	Construction of a new playground, multi-sport field, expanded fitness area, improved park amenities, and climate-resilient renovation.	Under Construction

Project Name	Project Location	Description	Status
Pending City Building and Safety Permits and/or Approved Projects			
Garden Street Hotel	Southwest corner of Garden Street and East Yanonali Street	Construction of a new 250-room hotel spanning a 4.53-acre site.	Approved
La Cumbre Plaza Redevelopment	La Cumbre Plaza at South Hope Avenue	Redevelopment with residential/mixed-use development on a 31-acre site.	Pending
BLD2025-02972	1701 La Coronilla Drive	Issuance of a building permit on a site currently occupied by a single-family residence.	Pending
BLD2025-01220	807 Dolores Drive	Issuance of a building permit on a site currently occupied by a single-family residence.	Pending
BLD2025-02915	510 Meigs Road	Issuance of a building permit on a site currently occupied by a single-family residence.	Pending
BLD2025-02928	1135 Harbor Hills Drive	Issuance of a building permit on a site currently occupied by a single-family residence.	Pending
BLD2025-02249	1615 La Vista Del Oceano	Issuance of a building permit on a site currently occupied by a single-family residence.	Pending
BLD2025-01587	262 Santa Catalina Avenue	Issuance of a building permit on a site currently occupied by a single-family residence.	Pending
BLD2025-02871	715 Westwood Drive	Issuance of a building permit on a site currently occupied by a single-family residence.	Pending
BLD2025-02938	2330 Cliff Drive	Issuance of a building permit on a site currently occupied by a single-family residence.	Pending
BLD2025-02854	742 Westwood Drive	Issuance of a building permit on a site currently occupied by a single-family residence.	Pending
BLD2025-02378	726 Surf View Drive	Addition of 328 square feet to existing garage and new 749-square-foot ADU above the garage.	Pending
BLD2025-01683	2003 Red Rose Way	655-square-foot conversion of existing storage room to a new ADU.	Pending
BLD2023-00708	220 Salida Del Sol	Conversion of an existing 622-square-foot garage and interior adjacent bedroom into an ADU.	Pending
BLD2023-01791	1414 Santa Rosa Avenue	Addition of a master suite and new two-car garage at first floor, with a roof deck over the garage. New second floor ADU totaling 823 square feet.	Pending
BLD2023-03453	1391 Santa Rita Circle	372 net square feet garage conversion to ADU.	Pending
BLD2025-00958	1394 Santa Rita Circle	New prefabricated ADU.	Pending
BLD2025-00908	222 Las Ondas	Demolition of an existing 806-square-foot single story residence and construction of a new 1,872-square-foot two-story residence with a 410-square-foot garage and 336-square-foot attached ADU.	Pending
BLD2025-01663	1126 Las Olas Avenue	Construction of a new 904-square-foot ADU.	Pending
BLD2025-02257	1105 Las Olas Avenue	Conversion of an existing attached garage into a new ADU.	Pending

Notes: ADU = accessory dwelling unit

4 Environmental Impact Analysis

This chapter discusses the possible environmental effects of the Vic Trace Reservoir Replacement Project ("Project" or "proposed Project") for the specific issue areas that were identified through the scoping process as having the potential to experience significant effects. A "significant effect" as defined by the *CEQA Guidelines* Section 15382:

> …means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant.

The assessment of each issue area begins with a discussion of the environmental setting related to the issue, which is followed by the impact analysis. In the impact analysis, the first subsection identifies the methodologies used and the "significance thresholds," which are those criteria adopted by the City and other agencies, universally recognized, or developed specifically for this analysis to determine whether potential effects are significant. The next subsection describes each impact of the proposed Project, mitigation measures for significant impacts, and the level of significance after mitigation. Each effect under consideration for an issue area is separately listed in bold text with the discussion of the effect and its significance. Each bolded impact statement also contains a statement of the significance determination for the environmental impact as follows:

- **Significant and Unavoidable.** An impact that cannot be reduced to below the threshold level given reasonably available and feasible mitigation measures. Such an impact requires a Statement of Overriding Considerations to be issued if the Project is approved pursuant to *CEQA Guidelines* Section 15093.
- **Less than Significant with Mitigation Incorporated.** An impact that can be reduced to below the threshold level given reasonably available and feasible mitigation measures. Such an impact requires findings pursuant to *CEQA Guidelines* Section 15091.
- **Less than Significant.** An impact that may be adverse but does not exceed the threshold levels and does not require mitigation measures. However, mitigation measures that could further lessen the environmental effect may be suggested if readily available and easily achievable.
- **No Impact.** The proposed Project would have no effect on environmental conditions or would reduce existing environmental problems or hazards.

Following each environmental impact discussion is a list of mitigation measures (if required) and the residual effects or level of significance remaining after implementation of the measure(s). The impact analysis concludes with a discussion of cumulative effects, which evaluates the impacts associated with the proposed Project in conjunction with other planned and pending developments in the area listed in Chapter 3, *Environmental Setting*.

The Executive Summary of this EIR summarizes all impacts and mitigation measures that apply to the proposed Project.

This page intentionally left blank.

4.1 Aesthetics

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to aesthetics would be significant if the proposed Project would:

1. Have a substantial adverse effect on a scenic vista.
2. Substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.
3. In non-urbanized areas, substantially degrade existing visual character or quality of public views of the site and its surroundings. If the project is in an urbanized area, conflict with applicable zoning and other regulations governing scenic quality.
4. Create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.

The Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 1, 2, and 3 would be less than significant or have no impact. These impacts are discussed in Initial Study Environmental Checklist Section 1, Aesthetics and Visual Resources (Appendix A). Thus, the following discussion solely focuses on the threshold question regarding creation of a new source of substantial light or glare (Threshold 4).

4.1.1 Setting

a. Existing Visual Conditions

The city of Santa Barbara is a seaside city adjacent to the Pacific Ocean in southern Santa Barbara County and is generally bisected by United States Highway 101. Santa Barbara contains steep lateral ridges and canyons on the south-facing flanks of the Santa Ynez Mountains, the coastal plain at the mountains' base that extends to the city's beachfront, and the uplifted marine terrace that forms the Mesa[1]. The City contains approximately 5.75 miles of shoreline, including approximately three miles of maintained beaches and approximately 2.75 miles of narrow or intertidal beaches backed by eroding cliffs.[2] Periods of Hispanic and early California history are captured in the architecture of the built environment within the city, as Santa Barbara's history of human settlement extends back some 8,000 years.[3]

b. Light and Glare

In the context of the *CEQA Guidelines* for light and glare:

- Light is nighttime illumination that stimulates sight and makes surrounding features visible. Typical sources of light include streetlights, exterior building lighting, and interior building lights shining through windows.
- Glare is primarily a daytime occurrence caused by the reflection of sunlight or artificial light from reflective surfaces. Typical sources of glare include reflective building materials such as metal, glass, and reflective surface coatings.

[1] The Mesa is a coastal neighborhood in southern Santa Barbara named for its elevated, flat-topped terrain overlooking the Pacific Ocean.
[2] Santa Barbara, City of. 2019. City of Santa Barbara Local Coastal Program Coastal Land Use Plan. https://santabarbaraca.gov/sites/default/files/documents/Services/LCP%20Update/City%20of%20Santa%20Barbara%20Complete%20Certified%20Coastal%20LUP.pdf (accessed January 2026).
[3] Santa Barbara, City of. 2011a. Plan Santa Barbara Introduction. https://santabarbaraca.gov/sites/default/files/documents/General%20Plan/General%20Plan/Introduction.pdf (accessed January 2026).

Baseline (existing) light conditions in the vicinity of the Project site are typical of those found in suburban areas (e.g., roadway lighting, building lighting, residential buildings, headlights from motor vehicles). Sources of daytime glare include direct beam sunlight and reflections from the water, windows, architectural coatings, glass, and other reflective surfaces. Sources of nighttime light include structure illumination, decorative landscape lighting, lighted signs, streetlights, and vehicle headlights. The Project site includes existing security lighting around its perimeter.

4.1.2 Regulatory Framework

a. Federal Regulations

No existing federal plans, policies, regulations, or laws related to aesthetics are applicable to the proposed Project.

b. State Regulations

California Code of Regulations Title 24 - Building Lighting Characteristics

The California Building Standards Code (California Code of Regulations [CCR] Title 24) includes the Building Energy Efficiency Standards (included in Parts 6 and 12 of CCR Title 24). Section 6.3 of the Nonresidential and Multifamily Compliance Manual of the Building Energy Efficiency Standards regulates lighting characteristics (i.e., maximum power/brightness, shielding, light sensor controls). Different lighting standards are set by classifying areas by lighting zone. The classification is based on 2010 United States Census population estimates. Areas can be designated as LZ0 (very low), LZ1 (low), LZ2 (moderate), LZ3 (moderately high), and LZ4 (high). Lighting requirements for dark and rural areas are stricter to protect the areas from new sources of light pollution and light trespass. The Project site falls under the "urban" standard, which applies to areas identified by the United States Census as containing higher population densities and more intensive development patterns.

c. Local Regulations

Plan Santa Barbara

Plan Santa Barbara, which was adopted by the City of Santa Barbara in December 2011, serves as the City's General Plan. The City's General Plan contains goals and policies related to aesthetics and visual resources within the Land Use Element and Environmental Resources Element.[4,5] However, there are no policies specifically pertaining to light and glare, and the City does not regulate private views.

City Design Guidelines

The City's Design Guidelines establish a set of goals, values, and qualities by which projects are evaluated in design review. The Design Guidelines provide detailed direction for specific areas and types of projects. Not all guideline techniques or approaches are appropriate or practical for every project. In cases where sets of multiple design guidelines apply, the guidelines are viewed as

[4] Santa Barbara, City of. 2011b. Plan Santa Barbara Land Use Element. https://santabarbaraca.gov/sites/default/files/documents/General%20Plan/General%20Plan/Land%20Use%20Element%2A.pdf (accessed January 2026).
[5] Santa Barbara, City of. 2011c. Plan Santa Barbara Environmental Resources Element. https://santabarbaraca.gov/sites/default/files/documents/General%20Plan/General%20Plan/Environmental%20Resources%20Element%20%28includes%20Noise%2A%20and%20Conservation%2A%29.pdf (accessed January 2026).

"layers" where the most specific guidelines take precedence. The Design Guidelines include several references to preserving public scenic vistas and views in terms of proposed Project compatibility with the existing environment.

A key subset of the City's Design Guidelines relevant to the Project is the Outdoor Lighting Design Guidelines. While the City maintains additional building and site features guidelines including Fence, Screen, Wall, and Hedge Guidelines, the Outdoor Lighting Design Guidelines specifically focus on reducing light spill, glare, and excessive nighttime illumination. These guidelines describe acceptable design standards for outdoor lighting installations throughout the City, including expectations related to fixture shielding, light direction, color temperature, and overall illumination levels. Their primary purpose is to ensure that exterior lighting is appropriately scaled, avoids producing obtrusive glare, and remains compatible with the City's visual character and nighttime environment.

City of Santa Barbara Municipal Code

The City of Santa Barbara Municipal Code (SBMC) Title 28 and Title 30 jointly implement land use designations established within the Local Coastal Program and General Plan. While land use designations are more generalized in nature, the Zoning Code and associated districts provide specific controls on land use, density or intensity of development, and development standards to implement the City's Local Coastal Program and General Plan goals and policies. The Zoning Code provides standards for protection of visual resources, compatible design, and illumination for new development associated within particular zoning districts. Section 30.180.070 sets performance standards for glare reduction that prohibit any use from producing significant, direct glare visible beyond the boundaries of the lot on which the use is located.

Title 22 of SBMC sets forth standards for development and construction throughout the city. Chapter 22.68 includes the design review process and standards for projects subject to the Architectural Board of Review. Standards for light and glare are implemented through Chapter 22.75, such as prohibiting lighting fixtures aimed at property lines and banning high-intensity sources like searchlights, and all projects for which design review is required are reviewed for consistency with the City's Outdoor Lighting Design Guidelines.

Santa Barbara Solar Energy System Design Guidelines

The City's Solar Energy System Design Guidelines establish goals and principles for integrating solar installations into the built environment while maintaining Santa Barbara's visual character. These guidelines provide detailed direction for the design and placement of solar energy systems, emphasizing compatibility with surrounding development and scenic resources. While not all techniques are applicable to every project, the guidelines function as layered standards, with the most specific provisions taking precedence when multiple sets apply.

The Solar Energy System Design Guidelines reference the importance of preserving public scenic vistas and views when evaluating Project compatibility with the existing environment; however, the City does not regulate private views. In addition, the City implements complementary design standards to ensure development avoids excessive glare and remains visually harmonious. These standards outline acceptable design practices for outdoor lighting and site features throughout the city.

4.1.3 Impact Analysis

a. Significance Criteria and Methodology

Significance Criteria

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to aesthetics would be significant if the proposed Project would:

4. Create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.

As mentioned above, the Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 1, 2, and 3 would be less than significant or have no impact. These impacts are discussed in the Initial Study Environmental Checklist Section 1, Aesthetics and Visual Resources (Appendix A). Thus, the following analysis solely focuses on the threshold question regarding creation of a new source of substantial light or glare (Threshold 4).

Methodology

The analysis of light and glare impacts focuses on the nature and magnitude of changes in lighting conditions on the Project site and surrounding area. Existing lighting and glare levels are compared with proposed sources (e.g., exterior fixtures, glazing, vehicle headlights) to identify changes in brightness, spill light, and potential glare. Under CEQA, significance is based on whether the Project would create a new source of substantial light or glare that would adversely affect day or nighttime views.

b. Project Impacts and Mitigation Measures

Threshold 4:	Would the project create a new source of substantial light or glare that would adversely affect daytime or nighttime views in the area?

Impact AES-1 WITH ADHERENCE TO EXISTING CITY REGULATIONS, THE PROPOSED PROJECT WOULD NOT CREATE A NEW SOURCE OF SUBSTANTIAL LIGHT OR GLARE THAT WOULD ADVERSELY AFFECT DAYTIME OR NIGHTTIME VIEWS. IMPACTS WOULD BE LESS THAN SIGNIFICANT.

Sensitive light and glare receptors are land uses or locations where occupants may be adversely affected by illumination or glare, such as residential areas, parks, recreational spaces, and other places where people expect low ambient lighting conditions. Sensitive light and glare receptors along the Project site include single-family residences located along La Coronilla Drive, Dolores Drive, Calle Del Oro, La Vista Del Oceano, La Cresta Circle, Harbor Hills Drive, and Ricardo Avenue.

Construction

Construction activities would occur between the hours of 7:00 a.m. and 5:00 p.m., Monday through Friday, with occasional nighttime or weekend work if necessary to minimize water outages. Daytime lighting would not be required. Any nighttime lighting required for construction would be limited to individual work areas and would be temporary in nature. Staging and laydown areas would occur on the Vic Trace Reservoir parcel and may be lit for security purposes. All temporary lighting would be shielded and directed downward and inward (toward the work or staging area) in accordance with the City of Santa Barbara Outdoor Lighting Ordinance (SBMC Chapter 22.75) and Outdoor Lighting

Design Guidelines, which limit the potential for light and glare. Temporary and intermittent glare during construction could occur from sunlight reflecting off equipment, vehicle windshields, or material staging areas; however, the amount of glare would not be substantial given the limited number of construction equipment on-site at any one time. The proposed Project would include the implementation of shielded, downward-facing, and project-facing lighting during nighttime work. Project construction would not create a new source of substantial light or glare that would adversely affect daytime or nighttime views in the area. Therefore, construction impacts would be less than significant.

Operation

Several existing structures on the Vic Trace Reservoir parcel, including portions of the access road, fencing, and certain utility appurtenances, would remain in place and would not result in increased light or glare because they would continue to operate under the same conditions as before, with no new lighting or reflective materials introduced. For the structures that would be replaced, the proposed designs would not introduce new sources of light or glare because the new facilities would remain low-profile, be screened from most views, and would be equipped with lighting used only intermittently for nighttime maintenance, consistent with existing operational practices. In addition, the reservoir currently features a corrugated steel roof, which is more reflective than the proposed buried condition. Under the Project, this roof would be removed and replaced with permeable finished surfaces such as aggregate base or gravel, which are substantially less reflective and would further reduce glare potential compared to existing conditions.

The primary potential source of glare during Project operation would be the reflection of sunlight off solar panel surfaces. Solar panels are comprised of cells designed to capture solar energy to convert it into usable energy. Therefore, solar panels are designed to absorb as much light as possible to maximize the efficiency of energy production. When compared to common reflective surfaces, solar panels with antireflective glass demonstrate lower glare and reflectance levels than standard window glass and other common reflective surfaces, such as water.[6] In addition, the Project site is located at the top of Lavigia Hill and would be surrounded by landscaping, which would further screen views of the solar panels from the surrounding neighborhood.

The Project would also comply with multiple City regulations that collectively minimize potential light and glare effects. SBMC Section 30.180.070 prohibits any use from producing significant, direct glare visible beyond the boundaries of the Project site. Title 22 further establishes design review requirements, including the City's Outdoor Lighting Ordinance (SBMC Chapter 22.75), which restricts lighting aimed toward property lines, bans high-intensity sources, and requires fixtures to be shielded and directed downward. Compliance with the City's Outdoor Lighting Design Guidelines would minimize the potential for new lighting to spill or create glare, as fixtures must be fully shielded and directed downward. With compliance of existing City regulations and the City's Outdoor Lighting Design Guidelines, impacts involving the introduction of glare would be less than significant.

Mitigation Measures

No mitigation is required.

[6] SunPower Corporation. 2019. Photovoltaic Systems: Lower Levels of Glare and Reflectance Vs. Surrounding Environment. https://majorprojects.planningportal.nsw.gov.au/prweb/PRRestService/mp/01/getContent?AttachRef=SSD-10353-MOD-3%2120220309T001447.185%20GMT (accessed January 2026).

4.1.4 Cumulative Impacts

Cumulative impacts consider impacts at the Project site together with similar impacts of existing development, ambient growth, and the reasonably anticipated projects listed in Table 3-1 in Chapter 3, *Environmental Setting*. The projects listed in Table 3-1 in Chapter 3, *Environmental Setting*, represent development and redevelopment that would physically change the visual environmental setting in Santa Barbara. Cumulative impacts regarding light and glare may occur if any of the related cumulative projects are located in close enough proximity to the Project site to combine with the Project and result in significant adverse changes in the light and glare of the surrounding area.

Cumulative development would contribute to an increase in light and glare throughout Santa Barbara. Sections 30.180.070 and 22.75 of the SBMC include specific requirements related to light and glare, which would minimize the potential for cumulative impacts. All cumulative projects would be required to adhere to the City's applicable specific design guidelines, General Plan and SBMC policies, and design review to reduce lighting and glare impacts. Furthermore, cumulative projects listed in Table 3-1 in Chapter 3, *Environmental Setting*, are sufficiently dispersed across the City such that they would not collectively illuminate or create glare at the same sensitive receptors as the Project. With adherence to applicable zoning, the City's design guidelines, and General Plan and SBMC policies, cumulative light and glare impacts would be less than significant.

4.2 Air Quality

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to air quality would be significant if the proposed Project would:

1. Conflict with or obstruct implementation of the applicable air quality plan.
2. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard.
3. Expose sensitive receptors to substantial pollutant concentrations.
4. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

The Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 1 and 4 would be less than significant or have no impact. These impacts are discussed in the Initial Study Environmental Checklist Section 3, Air Quality (Appendix A). Thus, the following discussion solely focuses on Thresholds 2 and 3.

4.2.1 Setting

a. Local Climate and Meteorology

California is divided geographically into 15 air basins for managing the air resources of the state on a regional basis. Areas within each air basin are considered to share the same air masses and, therefore, are expected to have similar ambient air quality. The Project site is located in the South Central Coast Air Basin (SCCAB), which covers San Luis Obispo, Santa Barbara, and Ventura counties. The Santa Barbara County Air Pollution Control District (SBCAPCD) monitors and regulates local air quality in Santa Barbara County. The regional climate in the SCCAB is Mediterranean and is characterized by warm summers and mild winters with relatively dry weather. The annual precipitation is 17.7 inches on average, with most (95 percent) occurring during the rainy season, which generally spans October through April. The warmest month is August and the coolest month is January (Western Regional Climate Center 2016).

An additional meteorological feature that influences Santa Barbara's climate is the semi-permanent subtropical high-pressure cell off the Pacific Coast. This cell creates the typical warm, dry summers and wet winters. Fog is frequently experienced in the city due to the humid marine air coming into contact with the warmer air over land. Fog typically occurs in the early morning or evening, particularly during late spring and early summer. Inversions, or the trapping of a stable layer of cool air below warmer air, caused in part by the Santa Ynez Mountains to the north of the city, can negatively affect air quality, due to reduced vertical mixing. An inversion essentially creates a cap over the city, reducing the dispersion of pollutants into the upper atmosphere (vertically) or across air basins (horizontally). Surface and upper-level wind flows vary seasonally and geographically, and lack of wind and the right meteorological conditions can lead to an inversion. Surface temperature inversions occur between 0 and 500 feet above the ground surface, and are most common during the winter. Subsidence inversions (1,000 to 2,000 feet above ground surface) are most common during the summer.

Wind patterns can link Santa Barbara and Ventura Counties with the more polluted air of the South Coast Air Basin (Los Angeles area). Air pollutants generated in the South Coast Air Basin can be blown offshore then carried to other coastal cities such as Santa Barbara. In addition, some pollution is transported from the San Fernando Valley to Ventura County, then into Santa Barbara. The prevailing winds passing through the city do not increase ground-level ozone (smog), and generally serve to transport pollutants offshore. However, atypical wind flow patterns can transport pollutants generated in other areas, such as Los Angeles, into the SCCAB (City of Santa Barbara 2010).

b. Air Pollutants of Primary Concern

Primary criteria pollutants are emitted directly from a source (e.g., vehicle tailpipe, an exhaust stack of a factory, etc.) into the atmosphere. Primary criteria pollutants include carbon monoxide (CO), nitrogen dioxide, particulate matter with diameters 10 micrometers and smaller (PM_{10}), particulate matter with diameters 2.5 micrometers and smaller ($PM_{2.5}$), sulfur dioxide (SO_2), and lead. Ozone is considered a secondary criteria pollutant because it is created by atmospheric chemical and photochemical reactions between reactive organic compounds (ROC) and nitrogen oxides (NO_X). The following subsections describe the characteristics, sources, and health and atmospheric effects of criteria air contaminants.

Ozone

Ozone is a regional pollutant that typically occurs at elevated concentrations during warmer months when sunlight drives photochemical reactions. Ozone exposure can cause respiratory irritation and exacerbate existing respiratory conditions, particularly among children, the elderly, and individuals with asthma or other lung diseases (United States Environmental Protection Agency [USEPA] 2025).

Carbon Monoxide

Carbon monoxide is a localized pollutant primarily associated with incomplete combustion of fossil fuels, especially from motor vehicles. Elevated CO concentrations are generally limited to areas with high traffic volumes and can pose health risks to individuals with cardiovascular disease by reducing oxygen delivery to the heart (USEPA 2025).

Nitrogen Dioxide

Nitrogen dioxide (NO_2) is generated mainly by fuel combustion in vehicles and industrial equipment. Short-term exposure can irritate the respiratory system and aggravate existing respiratory conditions, while longer-term exposure may contribute to the development of asthma and increased susceptibility to respiratory infections (USEPA 2025).

Sulfur Dioxide

Sulfur Dioxide (SO_2) is included in a group of highly reactive gases known as sulfur oxides. The largest sources of SO_2 emissions are from fossil fuel combustion at power plants (73%) and other industrial facilities (20%). Smaller sources of SO_2 emissions include industrial processes such as extracting metal from ore and burning fuels with a high sulfur content by locomotives, large ships, and off-road equipment. Short-term exposures to SO_2 can harm the human respiratory system and make breathing difficult. People with asthma, particularly children, are sensitive to these effects of SO_2 (USEPA 2025).

Particulate Matter

Particulate Matter (PM) consists of a mixture of solid particles and liquid droplets. PM_{10} is commonly associated with dust and mechanical processes, while $PM_{2.5}$ is primarily associated with combustion and secondary atmospheric formation. Exposure to particulate matter can cause respiratory and cardiovascular effects, with $PM_{2.5}$ posing greater health risks due to its ability to penetrate deep into the lungs (USEPA 2025).

Lead

Lead emissions have declined substantially due to the phase-out of leaded gasoline, and current sources are primarily associated with industrial activities. Lead exposure can adversely affect neurological, developmental, and cardiovascular systems, with children being particularly vulnerable (USEPA 2025).

Toxic Air Contaminants

In addition to criteria pollutants, toxic air contaminants (TACs) are pollutants that may cause serious illness or increased mortality and include substances regulated under California and federal air toxics programs. Diesel particulate matter (DPM) is one of the most common TACs in California and is a component of $PM_{2.5}$. TACs are evaluated based on cancer risk and acute or chronic health effects rather than ambient air quality standards (CARB 2020; CARB 2025a).

c. Current Air Quality

California is divided geographically into 15 air basins for managing the air resources of the state on a regional basis. Areas within each air basin are considered to share the same air masses and are therefore expected to have similar ambient air quality. If an air basin is not in either federal or state attainment for a particular pollutant, the basin is classified as a nonattainment area for that pollutant. Under the federal and state Clean Air Acts (CAA), once a nonattainment area has achieved the air quality standards for a particular pollutant, it may be redesignated to an attainment area for that pollutant. To be redesignated, the area must meet air quality standards and have a 10-year plan for continuing to meet and maintain air quality standards as well as satisfy other requirements of the federal CAA. Areas that have been redesignated to attainment are called maintenance areas.

The SBCAPCD operates a network of air quality monitoring stations throughout Santa Barbara County. The purpose of the monitoring stations is to measure ambient concentrations of pollutants and determine whether ambient air quality meets the California and federal standards. There is one monitoring station within the city, located at 700 East Canon Perdido Street. However, NO_2 data is not available from the 700 East Canon Perdido Street monitoring station; therefore, data for NO_2 has been taken from the next closest available monitoring station, which is the Carpinteria-Gobernador Road station located 13 miles east of the Project site.

Table 4.2-1 indicates the number of days that each of the standards has been exceeded at the Santa Barbara and Carpinteria monitoring stations. As shown therein, the PM_{10} California Ambient Air Quality Standards (CAAQS) was exceeded in 2022 and 2023. No other state or federal standards were exceeded at these monitoring stations over this time period. Santa Barbara County is designated nonattainment for the PM_{10} CAAQS and nonattainment-transitional for the ozone CAAQS. The County is designated attainment or unclassified for all other NAAQS and CAAQS (SBCAPCD 2025).

Table 4.2-1 Ambient Air Quality at the Santa Barbara Monitoring Station

Pollutant	2022	2023	2024
Ozone (ppm), 8-Hr Average[1]	0.058	0.052	0.054
Number of Days of state exceedances (>0.070 ppm)	0	0	0
Number of days of federal exceedances (>0.070 ppm)	0	0	0
Ozone (ppm), Worst Hour[1]	0.065	0.064	0.061
Number of days of state exceedances (>0.09 ppm)	0	0	0
Number of days of federal exceedances (>0.112 ppm)	0	0	0
Nitrogen Dioxide (ppm) - Worst Hour[2]	0.02	0.01	0.01
Number of days of state exceedances (>0.18 ppm)	0	0	0
Number of days of federal exceedances (>0.10 ppm)	0	0	0
Particulate Matter 10 microns, μg/m^3, Worst 24 Hours[1]	58.7	55.2	42.8
Number of days of state exceedances (>50 μg/m^3)	4	1	0
Number of days above federal standard (>150 μg/m^3)	0	0	0
Particulate Matter <2.5 microns, μg/m^3, Worst 24 Hours[1]	20.0	26.4	20.2
Number of days above federal standard (>35 μg/m^3)	0	0	0

[1] Data from the Santa Barbara Monitoring Station located at 700 E Canon Perdido Street.

[2] Data from the Carpinteria Monitoring Station located at Gobernador Road.

Source: CARB 2025b

d. Sensitive Receptors

As defined by CARB and the Office of Environmental Health Hazard Assessment (OEHHA), sensitive receptors include those individuals who are at a heightened risk of negative health outcomes due to exposure to air pollution, including children and infants, people older than 65 years, and persons with cardiovascular and chronic respiratory diseases such as asthma, emphysema, and bronchitis. Some land uses, specifically those where sensitive receptors generally reside and/or gather, are considered to be more sensitive to air pollution than other land use types due to the population groups or activities involved. Referred to as sensitive receptor locations, these may include residences, hospitals, schools, special care facilities, recreational areas, religious institutions, childcare centers, and other such locations as the air district board or CARB may determine (California Health and Safety Code Section 42705.5[a][5]).

The Project site is located in the Alta Mesa neighborhood in the City of Santa Barbara. Residences exist adjacent to the Project site boundary and along the Project alignment for offsite improvements.

4.2.2 Regulatory Setting

a. Federal Regulations

Federal Clean Air Act

The Federal Clean Air Act (CAA) was enacted in 1970 and amended in 1977 and 1990 [42 United States Code 7401] for the purpose of protecting and enhancing the quality of the nation's air resources to benefit public health, welfare, and productivity. In 1971, to achieve the purposes of

Section 109 of the CAA [42 United States Code 7409], the USEPA developed primary and secondary National Ambient Air Quality Standards (NAAQS).

The primary NAAQS "in the judgment of the Administrator,[1] based on such criteria and allowing an adequate margin of safety, are requisite to protect the public health," and the secondary NAAQS are to "protect the public welfare from any known or anticipated adverse effects associated with the presence of such air pollutant in the ambient air" (42 United States Code 7409[b][2]). The USEPA classifies specific geographic areas as either "attainment" or "nonattainment" areas for each pollutant based on the comparison of measured data with the NAAQS. States are required to adopt enforceable plans, known as a State Implementation Plan, to achieve and maintain air quality meeting the NAAQS. State plans also must control emissions that drift across state lines and impact air quality in downwind states. Table 4.2-2 lists the current federal standards for regulated pollutants.

To derive the NAAQS, the USEPA reviews data from integrated science assessments and risk/exposure assessments to determine the ambient pollutant concentrations at which human health impacts occur, then reduces these concentrations to establish a margin of safety. As a result, human health impacts caused by the air pollutants discussed in Section 4.1.1(b), *Air Pollutants of Primary Concern*, may affect people when ambient air pollutant concentrations are at or above the concentrations established by the NAAQS. The closer a region is to attaining a particular NAAQS, the lower the human health impact is from that pollutant. Accordingly, ambient air pollutant concentrations below the NAAQS are considered to be protective of human health. The NAAQS and the underlying science that forms the basis of the NAAQS are reviewed every five years to determine whether updates are necessary to continue protecting public health with an adequate margin of safety (USEPA 2024).

Table 4.2-2 Federal and State Ambient Air Quality Standards

Pollutant	NAAQS	CAAQS
Ozone	0.070 ppm (8-hr avg)	0.09 ppm (1-hr avg) 0.070 ppm (8-hr avg)
Carbon Monoxide	35.0 ppm (1-hr avg) 9.0 ppm (8-hr avg)	20.0 ppm (1-hr avg) 9.0 ppm (8-hr avg)
Nitrogen Dioxide	0.100 ppm (1-hr avg) 0.053 ppm (annual avg)	0.18 ppm (1-hr avg) 0.030 ppm (annual avg)
Sulfur Dioxide	0.075 ppm (1-hr avg) 0.5 ppm (3-hr avg) 0.14 ppm (24-hr avg) 0.030 ppm (annual avg)	0.25 ppm (1-hr avg) 0.04 ppm (24-hr avg)
Lead	0.15 μg/m^3 (rolling 3-month avg) 1.5 μg/m^3 (calendar quarter)	1.5 μg/m^3 (30-day avg)
Particulate Matter (PM_{10})	150 μg/m^3 (24-hr avg)	50 μg/m^3 (24-hr avg) 20 μg/m^3 (annual avg)
Particulate Matter ($PM_{2.5}$)	35 μg/m^3 (24-hr avg) 9 μg/m^3 (annual avg)	12 μg/m^3 (annual avg)

[1] The term "Administrator" means the Administrator of the USEPA.

Pollutant	NAAQS	CAAQS
Visibility-Reducing Particles	No Federal Standards	Extinction coefficient of 0.23 per kilometer – visibility of 10 miles or more (0.07 - 30 miles or more for Lake Tahoe) due to particles when relative humidity is less than 70 percent (8-hr avg)
Sulfates	No Federal Standards	25 μg/m^3 (24-hr avg)
Hydrogen Sulfide	No Federal Standards	0.03 ppm (1-hr avg)
Vinyl Chloride	No Federal Standards	0.01 ppm (24-hr avg)

NAAQS = National Ambient Air Quality Standards; CAAQS = California Ambient Air Quality Standards; ppm = parts per million; avg = average; μg/m^3 = micrograms per cubic meter

Source: CARB 2024b

Construction Equipment Fuel Efficiency Standard

The USEPA sets emission standards for construction equipment. The first federal standards (Tier 1) were adopted in 1994 for all off-road engines over 50 horsepower and were phased in by 2000. A new standard was adopted in 1998 that introduced Tier 1 for all equipment below 50 horsepower and established the Tier 2 and Tier 3 standards. The Tier 2 and Tier 3 standards were phased in by 2008 for all equipment. The current iteration of emissions standards for construction equipment are the Tier 4 efficiency requirements, which are contained in 40 Code of Federal Regulations Parts 1039, 1065, and 1068 (originally adopted in 69 Federal Register 38958 [June 29, 2004] and most recently updated in 2014 [79 Federal Register 46356]).

To meet these Tier 4 emission standards, engine manufacturers are required to produce new off-road engines with advanced emission control technologies. However, because the emission control devices can be damaged by sulfur, the USEPA has also adopted requirements for in-use diesel fuel to decrease sulfur levels by more than 99 percent. Referred to as "Ultra Low Sulfur Diesel Fuel," this fuel type is required to have a maximum sulfur concentration of 15 parts per million. Emissions requirements for new off-road Tier 4 vehicles were completely phased in by the end of 2015.

b. State Regulations

California Clean Air Act

The California Clean Air Act (CCAA) was enacted in 1988 (California Health and Safety Code Section 39000 et seq.). Under the CCAA, the State has developed the California Ambient Air Quality Standards (CAAQS), which are generally more stringent than the NAAQS. Table 4.2-2 (included under Section 4.1.2[a], *Federal Regulations*) lists the current state standards for regulated pollutants. In addition to the federal criteria pollutants, the CAAQS also specify standards for visibility-reducing particles, sulfates, hydrogen sulfide, and vinyl chloride. Similar to the federal CAA, the CCAA classifies specific geographic areas as either "attainment" or "nonattainment" areas for each pollutant, based on the comparison of measured data within the CAAQS.

California Air Toxics Program

The California Air Toxics Program establishes the process for the identification and control of TACs and includes provisions to make the public aware of significant toxic exposures, and provisions for reducing risk. Several pieces of legislation form the basis of this program, including:

- **Toxic Air Contaminant Identification and Control Act (Assembly Bill [AB] 1807 of 1983: Health and Safety Code Sections 39650 to 39674):** Establishes the process for identifying TACs and reducing public exposure through a two-step risk assessment and risk management framework.
- **AB 2728 of 1992:** Requires CARB to identify federal hazardous air pollutants as TACs; pursuant to this statute, CARB designated 189 hazardous air pollutants as TACs and has since identified over 200 substances or substance groups.
- **Air Toxics "Hot Spots" Information and Assessment Act (AB 2588 of 1987):** Requires stationary sources to report TAC emissions to identify localized health risks, notify affected communities, and reduce significant risks to acceptable levels.
- **Children's Environmental Health Protection Act (Senate Bill 25 of 1999):** Directs CARB to evaluate air quality standards and monitoring programs from a children's health perspective and to develop additional controls, as needed, to protect children from air pollutant exposures.

State Implementation Plan

The State Implementation Plan is a collection of documents that set forth the state's strategies for achieving the ambient air quality standards. In California, the State Implementation Plan is a compilation of new and previously submitted plans, programs (such as monitoring, modeling, and permitting), district rules, state regulations, and federal controls. CARB is the lead agency for all purposes related to the State Implementation Plan under state law. Local air districts and other agencies, such as the Department of Pesticide Regulation and the Bureau of Automotive Repair, prepare State Implementation Plan elements and submit them to CARB for review and approval. CARB then forwards State Implementation Plan revisions to USEPA for approval and publication in the Federal Register. The items included in the California State Implementation Plan are listed at 40 Code of Federal Regulations 52.220.

As the regional air quality management district, the SBCAPCD is responsible for preparing and implementing the portion of the State Implementation Plan applicable to the portion of the SCCAB within its jurisdiction. The air pollution control district for each county adopts rules, regulations, and programs to attain federal and state air quality standards and appropriates money (including permit fees) to achieve these objectives.

California Code of Regulations

The California Code of Regulations is the official compilation and publication of the regulations adopted, amended, or repealed by state agencies pursuant to the Administrative Procedure Act. They are compiled into Titles and organized into Divisions containing the regulations of state agencies. The following California Code of Regulations provisions would be applicable to the proposed Project:

- **Engine Idling.** In accordance with Section 2485 of Title 13 of the California Code of Regulations, the idling of all diesel-fueled commercial vehicles (weighing over 10,000 pounds) during construction shall be limited to five minutes at any location.
- **Emission Standards.** In accordance with Section 93115 of Title 17 of the California Code of Regulations, operation of any stationary, diesel-fueled, compression-ignition engines shall meet specified fuel and fuel additive requirements and emission standards.

California On-Road Heavy-duty Vehicle Program

CARB has adopted standards for emissions from various types of new on-road heavy-duty vehicles. Title 13 California Code of Regulations Section 1956.8 contains California's emission standards for on-road heavy-duty engines and vehicles, and test procedures. CARB has also adopted programs to reduce emissions from in-use heavy-duty vehicles, including the Heavy-Duty Diesel Vehicle Idling Reduction Program, the Heavy-Duty Diesel In-Use Compliance Program, the Public Bus Fleet Rule and Engine Standards, the School Bus Program, and others.

Verified Diesel Emission Control Strategies

Tiered off-road emission standards promulgated by USEPA and CARB only apply to new engines, and existing off-road equipment can last for several years before replacement. As a result, CARB has developed Verified Diesel Emission Control Strategies, which are devices, systems, or strategies used to achieve the highest level of pollution control from existing off-road vehicles, to help reduce emissions from existing engines. Verified Diesel Emission Control Strategies are designed primarily for the reduction of diesel PM emissions and have been verified by CARB. There are three levels of Verified Diesel Emission Control Strategies, the most effective of which is the Level 3. Tier 4 engines are not required to install Verified Diesel Emission Control Strategies because they already meet the emissions standards for lower-tiered equipment with installed controls.

Heavy-Duty Engine and Vehicle Omnibus Regulation

The California Heavy-Duty Engine and Vehicle Omnibus Regulation, adopted by CARB in 2021 and amended in 2023, is a comprehensive rule aimed at significantly reducing NO_X and particulate matter emissions from medium- and heavy-duty vehicles. Starting with the 2024 model year, the regulation imposes stricter emission standards to reduce NO_X emissions by 75 percent and particulate matter emissions by 50 percent compared to 2010 standards. It also introduces a new low-load NO_X standard, strengthens durability and warranty requirements, and revamps in-use testing procedures to ensure compliance throughout a vehicle's operational life.

Enforcement of the Heavy-Duty Engine and Vehicle Omnibus Regulation remains uncertain at this time. On June 12, 2025, House Joint Resolution 89 was signed into law, nullifying USEPA's notice that granted CARB's request for the regulation. The future of implementation remains unclear as California pursues legal action against the resolution.

c. Local Regulations

Santa Barbara County Air Pollution Control District

As the local air quality management agency, the SBCAPCD is required to monitor air pollutant levels to ensure that state and federal air quality standards are met and, if they are not met, to develop strategies to meet the standards. Depending on whether the standards are met or exceeded, the SCCAB is classified as being in "attainment" or "nonattainment." In areas designated as non-attainment for one or more air pollutants, a cumulative air quality impact exists for those air pollutants, and the human health impacts described in Section 2.1.2, *Air Pollutants of Primary Concern*, are already occurring in that area as part of the environmental baseline condition.

Under state law, air districts are required to prepare a plan for air quality improvement for pollutants for which the district is in non-compliance. The *2001 Clean Air Plan* (2002) was the first plan prepared by SBCAPCD and established specific planning requirements to maintain the state

one-hour ozone standard. In 2006, CARB revised the CAAQS and added an 8-hour average to the ozone standard. Both components of the standard must now be met before CARB can designate an area to be in attainment. The most recent *2022 Ozone Plan* was adopted by SBCAPCD in December 2022 and was the seventh update to the *2001 Clean Air Plan*. The *2022 Ozone Plan* only addresses SBCAPCD's progress toward attaining the ozone CAAQS (SBCAPCD 2022a).

In addition, to minimize potential impacts from project emissions, the SBCAPCD implements rules and regulations for emissions that may be generated by various uses and activities. The rules and regulations detail pollution-reduction measures that must be implemented during construction and operation of projects. Rules and regulations relevant to the Project include the following:

- **Rule 345 (Control of Fugitive Dust from Construction and Demolition Activities).** This rule establishes fugitive dust control requirements for any activity associated with construction or demolition of a structure or structures.
- **Rule 323.1 (Architectural Coatings).** This rule establishes volatile organic content limits for architectural coatings that are manufactured, blended, repackaged, supplied, sold, or offered for sale within the SBCAPCD. Rule 323.1 limits the volatile organic content to 50 grams per liter for flat coatings and 100 grams per liter for non-flat coatings and traffic marking coatings.
- **Rule 329 (Cutback and Emulsified Asphalt Paving Materials).** This rule establishes ROC content limits pertaining to the manufacture, application, and sale of cutback and emulsified asphalt materials for paving, construction, and maintenance of streets, highways, parking lots, and driveways.

City of Santa Barbara

Policies pertaining to air quality and included in the Environmental Resources Elements are as follows (City of Santa Barbara 2011):

- **Policy ER5: Energy Efficiency and Conservation.** As part of the City's strategy for addressing climate change, minimizing pollution of air and water, depleting nonrenewable resources and insulating from volatility of fossil fuel prices, dependence on energy derived from fossil fuels shall be reduced through increased efficiency, conservation, and conversion to renewable energy sources when practicable and financially warranted.
  - **Retrofitting of Systems.** Continue to implement programs through Sustainable Santa Barbara for retrofitting of municipal systems with energy efficient equipment, systems, and programs.

City of Santa Barbara Municipal Code

Santa Barbara Municipal Code Chapter 30.185.340 applies to public works and utilities. Chapter 30.185.340 sets standards for rehabilitation of City reservoirs and basins, including incorporation of standard dust control measures to minimize air quality nuisances to surrounding properties.

4.2.3 Impact Analysis

a. Significance Criteria and Methodology

Significance Criteria

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to air quality would be significant if the proposed Project would:

2. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard.
3. Expose sensitive receptors to substantial pollutant concentrations.

As mentioned above, the Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 1 and 4 would be less than significant or have no impact. These impacts are discussed in the Initial Study Environmental Checklist Section 3, Air Quality (Appendix A). Thus, the following discussion solely focuses on Thresholds 2 and 3.

Construction Emissions Thresholds

SBCAPCD does not currently have quantitative thresholds of significance for short-term construction emissions. However, CEQA requires that the short-term impacts be analyzed, such as exhaust emissions from construction equipment and fugitive dust generation during grading. SBCAPCD recommends that construction-related NO_X, ROC, PM_{10}, and $PM_{2.5}$ emissions from diesel and gasoline powered equipment, paving, and other activities be quantified.

According to the SBCAPCD's *Scope and Content of Air Quality Sections in Environmental Documents,* SBCAPCD recommends quantification of construction-related emissions and suggests a 25-tons-per-year threshold for ROC or NO_X as a guideline for determining the significance of construction impacts (SBCAPCD 2022b). This is a limit that requires offsets if the construction activity is for a project that requires SBCAPCD permits and also provides guidance for other construction projects involving standard grading and building activities.

Standard dust control measures must be implemented for any discretionary project involving earthmoving activities, regardless of size or duration. According to the SBCAPCD, proper implementation of these required measures reduces fugitive dust emissions to a level that is less than significant (SBCAPCD 2022b). Therefore, all construction activity would be required to incorporate the SBCAPCD requirements pertaining to minimizing construction-related emissions and demolition of existing structures.

Operational Emissions Thresholds

As described in SBCAPCD's *Scope and Content of Air Quality Sections in Environmental Documents* and in *Environmental Review Guidelines,* a project will have a significant air quality effect on the environment if operation would:

- Generate from all project sources (both stationary and mobile) greater than 240 pounds per day of ROC
- Generate from all project sources (both stationary and mobile) greater than 240 pounds per day of NO_X

- Generate from all project sources (both stationary and mobile) greater than 80 pounds per day of PM_{10}
- Generate greater than 25 pounds per day of ROC from motor vehicle trips only
- Generate greater than 25 pounds per day of NO_X from motor vehicle trips only
- Cause or contribute to a violation of any California or National Ambient Air Quality Standard (except ozone)
- Exceed the public notification health risk thresholds adopted by the SBCAPCD of 10 excess cancer cases in a million for cancer risk or a Hazard Index of more than 1.0 for non-cancer risk
- Exceed thresholds adopted in federal and state air quality plans for Santa Barbara County

Toxic Air Containments Thresholds

SBCAPCD has developed significance thresholds for the emissions of TACs based on health risks associated with elevated exposure to such compounds. For carcinogenic compounds, cancer risk is assessed in terms of incremental excess cancer risk. A project would result in a potentially significant impact if it would generate an incremental excess cancer risk of 10 in one million (1×10^{-6}). Additionally, non-carcinogenic health risks are assessed in terms of a hazard index. A project would result in a potentially significant impact if it would result in a chronic and acute hazard index greater than 1.0 (SBCAPCD 2022b).

Methodology

Air pollutant emissions generated by Project construction and operation were estimated using the California Emissions Estimator Model (CalEEMod), version 2022.1. CalEEMod is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and GHG emissions associated with Project construction and operations. CalEEMod allows for the use of standardized data (e.g., emission factors, trip lengths, meteorology, source inventory) provided by the various California air districts to account for local requirements and conditions, and/or user-defined inputs. The calculation methodology and input data used in CalEEMod can be found in the CalEEMod User's Guide Appendices C, D, and G (California Air Pollution Control Officers Association [CAPCOA] 2022). The analysis reflects construction and operation of the Project as described in Chapter 2, *Project Description*.

Construction

Modeled construction emissions include emissions generated by onsite construction equipment and emissions generated by construction-related vehicle trips, such as worker and vendor trips. CalEEMod estimates construction emissions by multiplying the amount of time equipment is in operation by emission factors. Construction of the Project was analyzed based on applicant-provided construction schedules and a construction equipment list. Preliminary design showed the export of approximately up to 83,000 cubic yards of soil and approximately 4,417 tons of demolished concrete and steel. The Project would also comply with SBCAPCD Rule 345 (Control of Fugitive Dust from Construction and Demolition Activities), Rule 323.1 (Architectural Coating), and Rule 329 (Cutback and Emulsified Asphalt Paving Materials).

Operation

As discussed in Chapter 2, *Project Description*, regular operation, maintenance, and IT activities at the Vic Trace Reservoir parcel would resume and would be similar to existing conditions upon completion of construction activities. Therefore, operational emissions from area sources, mobile sources, and onsite natural gas consumption are excluded from emissions modeling. Compared to existing conditions, electricity consumption would increase by approximately 70,000 kWh per year to power the replaced La Coronilla Pump Station and new security systems not currently in place. However, electricity consumed by the Project would be generated either offsite or from renewable sources. Therefore, the Project would not generate air pollutant emissions related to energy usage.

Health Risk Assessment

The analysis of health risk from the Project is based on the Health Risk Assessment report prepared by Rincon in March 2026 (Appendix C). Air dispersion modeling and risk calculations for TACs generated by construction and operational emergency generator use were estimated using the USEPA-approved Air Dispersion Model (AERMOD) and a standalone risk calculation spreadsheet. The Health Risk Assessment report presents a detailed discussion of the methodology used in evaluating impacts of the proposed Project, including quantification of cancer and non-cancer health risk.

b. Project Impacts and Mitigation Measures

Threshold 2:	Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard?

Impact AQ-1 THE PROPOSED PROJECT WOULD NOT RESULT IN A CUMULATIVELY CONSIDERABLE NET INCREASE OF ANY CRITERIA POLLUTANT FOR WHICH THE PROJECT REGION IS NON-ATTAINMENT UNDER AN APPLICABLE FEDERAL OR STATE AMBIENT AIR QUALITY STANDARD. THE IMPACT WOULD BE LESS THAN SIGNIFICANT.

Construction Emissions

Construction-generated emissions are temporary and short-term. The following construction activities would generate emissions of O_3 precursors (ROC and NO_X), CO, SO_2, and fugitive dust (PM_{10} and $PM_{2.5}$):

- Demolition
- Grading
- Construction worker travel to and from the Project site
- Delivery and hauling construction supplies and debris to and from the Project site
- Fuel combustion by on-site construction equipment

Table 4.2-3 summarizes emissions that would be generated by the Project during construction. As shown therein, construction emissions generated would not exceed the SBCAPCD threshold of 25 tons per year for ROC or NO_x.

Table 4.2-3 Annual Construction Emissions

	Annual Emissions (tons per year)					
Construction Year	**ROC**	**NO_x**	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**
2028	0.7	2.6	2.7	<0.1	0.5	0.2
2029	0.7	5.1	6.4	<0.1	0.2	0.2
2030	0.2	1.6	2.0	<0.1	0.1	<0.1
Maximum Annual Emissions	**0.7**	**5.1**	**6.4**	**<0.1**	**0.5**	**0.2**
SBCAPCD Thresholds	25	25	N/A	N/A	N/A	N/A
Threshold Exceeded?	No	No	N/A	N/A	N/A	N/A

ROC = reactive organic compounds, NO_X = nitrogen oxides, CO = carbon monoxide, SO_2 = sulfur dioxide, PM_{10} = particulate matter 10 microns in diameter or less, $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter

Notes: All emissions modeling was completed using CalEEMod. See Appendix B for modeling results. Some numbers may not add up due to rounding.

Operational Emissions

As discussed in Chapter 2, *Project Description*, regular operation and maintenance activities associated with the Project would be similar to existing conditions. Emergency response and repairs are part of the City's normal operations to maintain system integrity and reliability and are not a new or increased activity associated with the Project. Therefore, the Project would not result in an increase in mobile source emissions beyond existing conditions.

Although electricity consumption would increase by approximately 70,000 kWh per year, electricity would be partially generated onsite by the proposed onsite solar array, with the remainder of electricity demand generated offsite. The Project would not result in onsite energy source emissions. Routine testing and maintenance of the proposed diesel emergency generator (to provide backup power to the proposed Valve and Pump Station Building) would generate criteria air pollutant emissions, such as NO_X and particulate matter. However, such emissions would be intermittent and infrequent, limited to periodic testing and maintenance events. Localized air pollutant impacts from siting of the proposed generator are discussed under Impact AQ-3 below. Operational emissions from the Project would not exceed SBCAPCD thresholds, and impacts from Project operation would be less than significant.

Threshold 3: Would the project expose sensitive receptors to substantial pollutant concentrations?

Impact AQ-2 THE PROPOSED PROJECT WOULD POTENTIALLY EXPOSE SENSITIVE RECEPTORS TO SUBSTANTIAL POLLUTANT CONCENTRATIONS. IMPLEMENTATION OF MITIGATION MEASURE AQ-1 WOULD BE REQUIRED, AND THE IMPACT WOULD BE LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED.

As indicated in Section 4.2.1(d), *Sensitive Receptors*, the closest sensitive receptors are single-family residences located adjacent to the Project site boundary and Project alignment. Localized air quality impacts to sensitive receptors typically result from TACs, which are discussed in the following subsections.

Toxic Air Contaminants

Construction Impacts

Construction of the proposed Project would result in temporary increases in local TAC emissions as a result of DPM generated by heavy-duty construction equipment and diesel-fueled truck trips used for the transport of demolition debris and soil.

A Health Risk Assessment was prepared for the proposed Project. The maximum unmitigated risk from construction of the proposed Project was identified for all sensitive receptors within 1,000 feet of the Project site boundary, as detailed in Appendix C. Table 4.2-4 presents the maximum estimated cancer risk and non-cancer chronic risk associated with Project construction at the maximum exposed off-site residential receptors. As shown therein, Project construction would exceed the SBCAPCD's threshold of 10 in one million for cancer risk. Project construction would not exceed the hazard index of 1 for chronic risk. Given that the cancer risk would exceed SBCAPCD thresholds, Project construction would potentially expose sensitive receptors to substantial TAC concentrations, and this impact would be potentially significant without mitigation.

Table 4.2-4 Estimated Cancer and Non-Cancer Health Risk During Project Construction - Unmitigated

	Cancer Risk (excess cases per one million persons)	Chronic Risk (Hazard Index)
Maximum Exposed Residential Receptor[1]	27.54	0.026
SBCAPCD Threshold	10	1
Exceed Threshold?	Yes	No

SBCAPCD = Santa Barbara County Air Pollution Control District

[1] Maximum Exposed Residential Receptor is on La Vista del Oceano along the southern boundary of the Project site.

Source: Appendix C

Operational Impacts

Operation of the proposed Project would result in long-term, local TAC emissions as a result of DPM generated by routine testing and maintenance of the proposed diesel emergency generator (to provide backup power to the proposed Valve and Pump Station Building). A Health Risk Assessment was prepared to assess localized TAC emission impacts of generator operations. The maximum unmitigated risk from operation of the proposed Project was identified for all sensitive (residential) receptors within 1,000 feet of the Project site boundary as detailed in Appendix C of the EIR. Table 4.2-5 presents the maximum estimated cancer risk and non-cancer chronic risk associated with Project operation at the maximum exposed off-site residential receptors. As shown therein, none of the estimated cancer or chronic risk numbers would exceed the SBCAPCD's threshold of 10 in one million for cancer risk or hazard index of 1 for chronic risk. Given that neither the cancer risk nor the non-cancer chronic risk would exceed SBCAPCD thresholds, Project operation would not expose sensitive receptors to substantial TAC concentrations, and this impact would be less than significant.

Table 4.2-5 Estimated Cancer and Non-Cancer Health Risk During Project Operation

	Cancer Risk (excess cases per one million persons)	Chronic Risk (Hazard Index)
Maximum Exposed Residential Receptor[1]	0.15	<0.001
SBCAPCD Threshold	10	1
Exceed Threshold?	No	No

SBCAPCD = Santa Barbara County Air Pollution Control District

[1] Maximum Exposed Residential Receptor is on Dolores Drive along the western boundary of the Project site.

Source: Appendix C

Combined Construction and Operational Impacts

Health risk associated with construction and operational sources of TAC emissions was combined to estimate the total lifetime risk experienced at the nearest sensitive receptors as a result of the proposed Project. The maximum unmitigated combined risk from construction and operation of the proposed Project was identified for all sensitive (residential) receptors within 1,000 feet of the Project site boundary as detailed in Appendix C of this EIR. Table 4.2-6 presents the combined maximum estimated cancer risk and non-cancer chronic risk associated with Project construction and operation at the maximum exposed off-site residential receptors. As shown therein, combined cancer risk would exceed the SBCAPCD's threshold of 10 in one million for cancer risk. Combined chronic risk would not exceed the SBCAPCD's threshold of a hazard index of 1 for chronic risk. The majority of risk in this combined scenario is from construction activities. Given that cancer risk would exceed SBCAPCD thresholds, the combined Project construction and operation would potentially expose sensitive receptors to substantial TAC concentrations, and this impact would be potentially significant without mitigation.

Table 4.2-6 Combined Estimated Cancer and Non-Cancer Health Risk During Project Construction and Operation - Unmitigated

	Cancer Risk (excess cases per one million persons)	Chronic Risk (Hazard Index)
Maximum Exposed Residential Receptor[1]	27.57	0.026
SCAQMD Threshold	10	1
Exceed Threshold?	Yes	No

SBCAPCD = Santa Barbara County Air Pollution Control District

Source: Appendix C

Mitigation Measures

AQ-1 Tier 4 Construction Equipment

All mobile off-road equipment (wheeled or tracked) greater than 50 horsepower used during construction activities shall meet the USEPA's Tier 4 final standards. Tier 4 certification can be for the original equipment or equipment that is retrofitted to meet the Tier 4 Final standards. In the event where Tier 4 Final equipment is not viable at the time of the award of the construction contract, the equipment shall meet Tier 3 standards at a minimum. A copy of each equipment's certified tier specification or model year specification shall be available upon request at the time of

mobilization of each piece of equipment. The City Environmental Analyst or designee shall ensure these requirements are incorporated into construction contract documents.

Significance After Mitigation

Mitigation Measure AQ-1 would require the use of off-road diesel-powered construction equipment that meets or exceeds the most stringent and environmentally protective CARB and USEPA Tier 4 off-road emissions standards if commercially viable, or alternatively fueled equipment which would substantially reduce DPM emissions. Table 4.2-7 and Table 4.2-8 present the maximum estimated cancer risk and non-cancer chronic risk associated with Project construction and construction combined with operation at the maximum exposed off-site residential receptors. As shown therein, none of the estimated cancer or chronic risk numbers would exceed the SBCAPCD's threshold of 10 in one million for cancer risk or hazard index of 1 for chronic risk. Thus, with implementation of Mitigation Measure AQ-1, construction-related and combined health impacts would be reduced to a less than significant level. Therefore, the Project would not expose sensitive receptors to substantial pollutant concentrations, and impacts would be less than significant with mitigation incorporated.

Table 4.2-7 Estimated Cancer and Non-Cancer Health Risk During Project Construction - Mitigated

	Cancer Risk (excess cases per one million persons)	Chronic Risk (Hazard Index)
Maximum Exposed Residential Receptor[1]	5.53	0.006
SBCAPCD Threshold	10	1
Exceed Threshold?	No	No

Source: Appendix C

4.2.4 Cumulative Impacts

Air quality emissions in one location contribute to regional air quality in the SCCAB. Therefore, the geographic scope for considering cumulative impacts to air quality includes the entire SCCAB, which is comprised of San Luis Obispo, Santa Barbara, and Ventura Counties as stated earlier in this section. Air pollution may combine with other cumulative projects (past, present, and reasonably foreseeable future) to violate criteria pollutant standards if the existing background sources cause nonattainment conditions, as they do according to the state standards for Ozone in the SBCAPCD.

Air districts manage attainment of the criteria pollutant standards by adopting rules, regulations, and attainment plans, which comprise a multifaceted programmatic approach to such attainment.

Air pollution is largely a cumulative issue, and SBCAPCD has provided guidance on the subject of cumulative impacts. The SBCAPCD *Environmental Review Guidelines and Scope and Content of Air Quality Sections in Environmental Documents* include recommendations for the analysis of cumulative impacts pertaining to ozone and localized pollutants. Inconsistency with the Ozone Plan is considered a cumulatively adverse air quality impact. Given that the Project would replace existing water infrastructure and would not induce growth in the region, the Project is consistent with the current 2022 Ozone Plan growth projections and criteria pollutant emission thresholds. As described in Impact AQ-2 above, the proposed Project's daily emissions of construction and operation of related pollutants would not exceed SBCAPCD regional thresholds; therefore, the Project's contribution to cumulative air quality impacts would not be cumulatively considerable.

According to the SBCAPCD's *Environmental Review Guidelines,* a project's potential contribution to cumulative impacts is assessed utilizing the same significance criteria as those for project specific impacts, which is if the project would generate an incremental excess cancer risk of 10 in one million non-carcinogenic health risks resulting in a chronic and acute hazard index greater than 1.0.In addition, SBCAPCD's *Scope and Content of Air Quality Sections in Environmental Documents* states a project will not have a significant impact on air quality cumulatively if it does not exceed those same thresholds.

The guidelines also state that the contribution of project emissions in conjunction with existing and proposed projects in the local area may be considered. As described under Impact AQ-3 above, with implementation of Mitigation Measure AQ-1, TAC emissions during construction and operation of the proposed Project would expose the maximum off-site residential receptor to a cancer risk of 5.53 in one million and 0.15 in one million, respectively, well below the threshold of 10 in one million. In addition, the chronic risk during construction and operational activities would be below the hazard index threshold of 1.0.

As shown in Table 3.1 of Section 3, *Environmental Setting*, of this EIR, several projects could be under construction within 1,000 feet from the Project site and potentially overlap with the Project's construction activity, including the Cliff Drive Vision Zero Project and various single-family residential developments throughout the Mesa neighborhood. These cumulative projects could expose sensitive receivers to cancer risks exceeding SBCAPCD's 10 in one million threshold for cancer risk or 1.0 acute hazard index for noncancer risk; however, similar to the proposed Project, cumulative projects would be required to comply with SBCAPCD regulations and thresholds to reduce the potential for significant impacts to sensitive receptors.

As stated in SBCAPCD's *Environmental Review Guidelines* and *Scope and Content of Air Quality Sections in Environmental Documents,* a project's potential contribution to cumulative impacts is assessed utilizing the same significance criteria as those for project specific impacts. Therefore, with each cumulative project complying with the project-specific thresholds, the proposed Project's contribution to localized health risk from construction and operational emissions would not be cumulatively considerable.

This page intentionally left blank.

4.3 Biological Resources

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to biological resources would be significant if the proposed Project would:

1. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S Fish and Wildlife Service.
2. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.
3. Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.
4. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.
5. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.
6. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

The Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 3, 4, and 6 would be less than significant or have no impact. These impacts are discussed in the Initial Study Environmental Checklist Section 4, Biological Resources (Appendix A). Thus, the following discussion solely focuses on Thresholds 1, 2, and 5. This section is based, in part, on the *Biological Resources Assessment Report for the Vic Trace Reservoir Replacement Project* (Appendix D).

4.3.1 Environmental Setting

a. Project Site Existing Conditions

The Project site consists of both the Vic Trace Reservoir parcel and the offsite improvements areas. The Vic Trace Reservoir parcel covers approximately 15 acres and hosts existing City-owned infrastructure facilities, including the Vic Trace Reservoir, valve building, and telecommunications facilities. The western portion of the Vic Trace Reservoir parcel also contains La Coronilla Park, an undeveloped, vegetated neighborhood park situated between 726 and 812 Dolores Drive. Other than the developments described above, the Vic Trace Reservoir parcel is generally undeveloped with vegetation communities such as grassland, coast live oak woodland, eucalyptus grove, sagebrush, and ice plant mats.

Offsite of the Vic Trace Reservoir parcel, the existing pipelines and the existing La Vista Del Oceano Pressure Reducing Valve (PRV) station to be replaced are located underground in paved roadways in the Alta Mesa residential neighborhood surrounding the Vic Trace Reservoir parcel. The proposed PRV station relocation site is located on undeveloped land in public right-of-way, in between a

paved curb, sidewalk, and a fenced private property. The single-family residence located at 1633 La Coronilla Drive is proposed to be used temporarily as construction offices during construction of the Project. No physical changes to this property are anticipated.

b. Physical Characteristics

Topography and Geography

The weather in Santa Barbara is typical of a Mediterranean climate. Summers are warm and dry, while winters are cool and wet with most of the precipitation falling between November and March. The Project site is located within the South Coast geographic subregion of California, approximately 0.6 mile north of the Pacific Ocean at an elevation of 210 to 475 feet above mean sea level. The Project site is located on a hill within the Alta Mesa area surrounded primarily by urban/developed land to the east, south, and west and is bordered by undeveloped natural woodland habitat on a steep north aspect slope to the north. The Project site is relatively buffered from natural habitats by local development of residences, streets, and other infrastructure. The Vic Trace Reservoir parcel is regularly mowed and vegetation is maintained for fire suppression, which further limits the establishment of natural habitats within that area.

Hydrology

The Project site is located within the Mission Creek-Frontal Santa Barbara Channel Subwatershed (Hydrologic Unit Code 12-180600130203). No aquatic features were observed within the Project site during a field survey conducted by Rincon Consultants, Inc. in July 2023. In addition, no streams or wetlands are documented within the Project site. Sheet flow created through precipitation events in the Project site drains generally outward and downslope from the constructed reservoir. Precipitation runoff flows through various culverts serving residential neighborhoods and roadways, which all drain into the Pacific Ocean to the south of the Project site.

Soils

The United States Department of Agriculture Natural Resources Conservation Service's Web Soil Survey depicts four soil map units within the Project site: Arnold Loamy Sand, 15 to 30 percent slopes, Eroded, Major Land Resource Area 20 (AgE2; MLRA); Ayar Clay, 15 to 30 percent slopes, Eroded (AhE2); Ayar Clay, 50 to 75 percent slopes (AhG); and Concepcion Fine Sandy Loam, 2 to 9 percent slopes (CgC). The site-specific soil observations from the field survey were generally consistent with those mapped by the Web Soil Survey.[1] None of the soil map units within the Project site are listed as hydric.

Vegetation Communities and Land Cover Types

Seven vegetation communities and two land cover types were documented within the Project site during the field survey. Table 4.3-1 lists each vegetation community and land cover type documented and provides their approximate acreage and the percent area covered in the Project site. Figure 4.3-1 depicts the locations of each vegetation community and land cover type in the Project site. Brief descriptions of the vegetation communities and land cover types are provided in the subsections below. The vegetation classification used for this analysis is based on *A Manual of*

[1] Published soil surveys are documented at a broad scale, and may not match the level of detail or refinement captured during formal jurisdictional delineation surveys, which were not relevant to this Project.

California Vegetation, Second Edition.[2] The land cover types that are not described in MCV2 were classified using conventional naming practices (i.e., nonnative/ornamental and developed/disturbed). One California Department of Fish and Wildlife (CDFW) sensitive natural community, lemonade berry scrub, is present within the Project site.

Table 4.3-1 Vegetation Communities and Land Cover Types within the Project Site

Type	Approximate Acreage	Approximate Percent Area
California Sagebrush Scrub	0.07	0.4%
Coast Live Oak Woodland	0.67	3.5%
Eucalyptus Groves	0.51	2.7%
Ice Plant Mats	2.76	14.5%
Lemonade Berry Scrub*	0.29	1.5%
Landscape/Ornamental	0.47	2.5%
Quailbush Scrub	0.23	1.2%
Wild Oats and Annual Brome Grassland	4.3	22.5%
Disturbed/Developed	*9.78*	*51.3%*
Total	**19.08**	**100.00%**

*Classified as a CDFW designated sensitive vegetation community.

Vegetation Communities

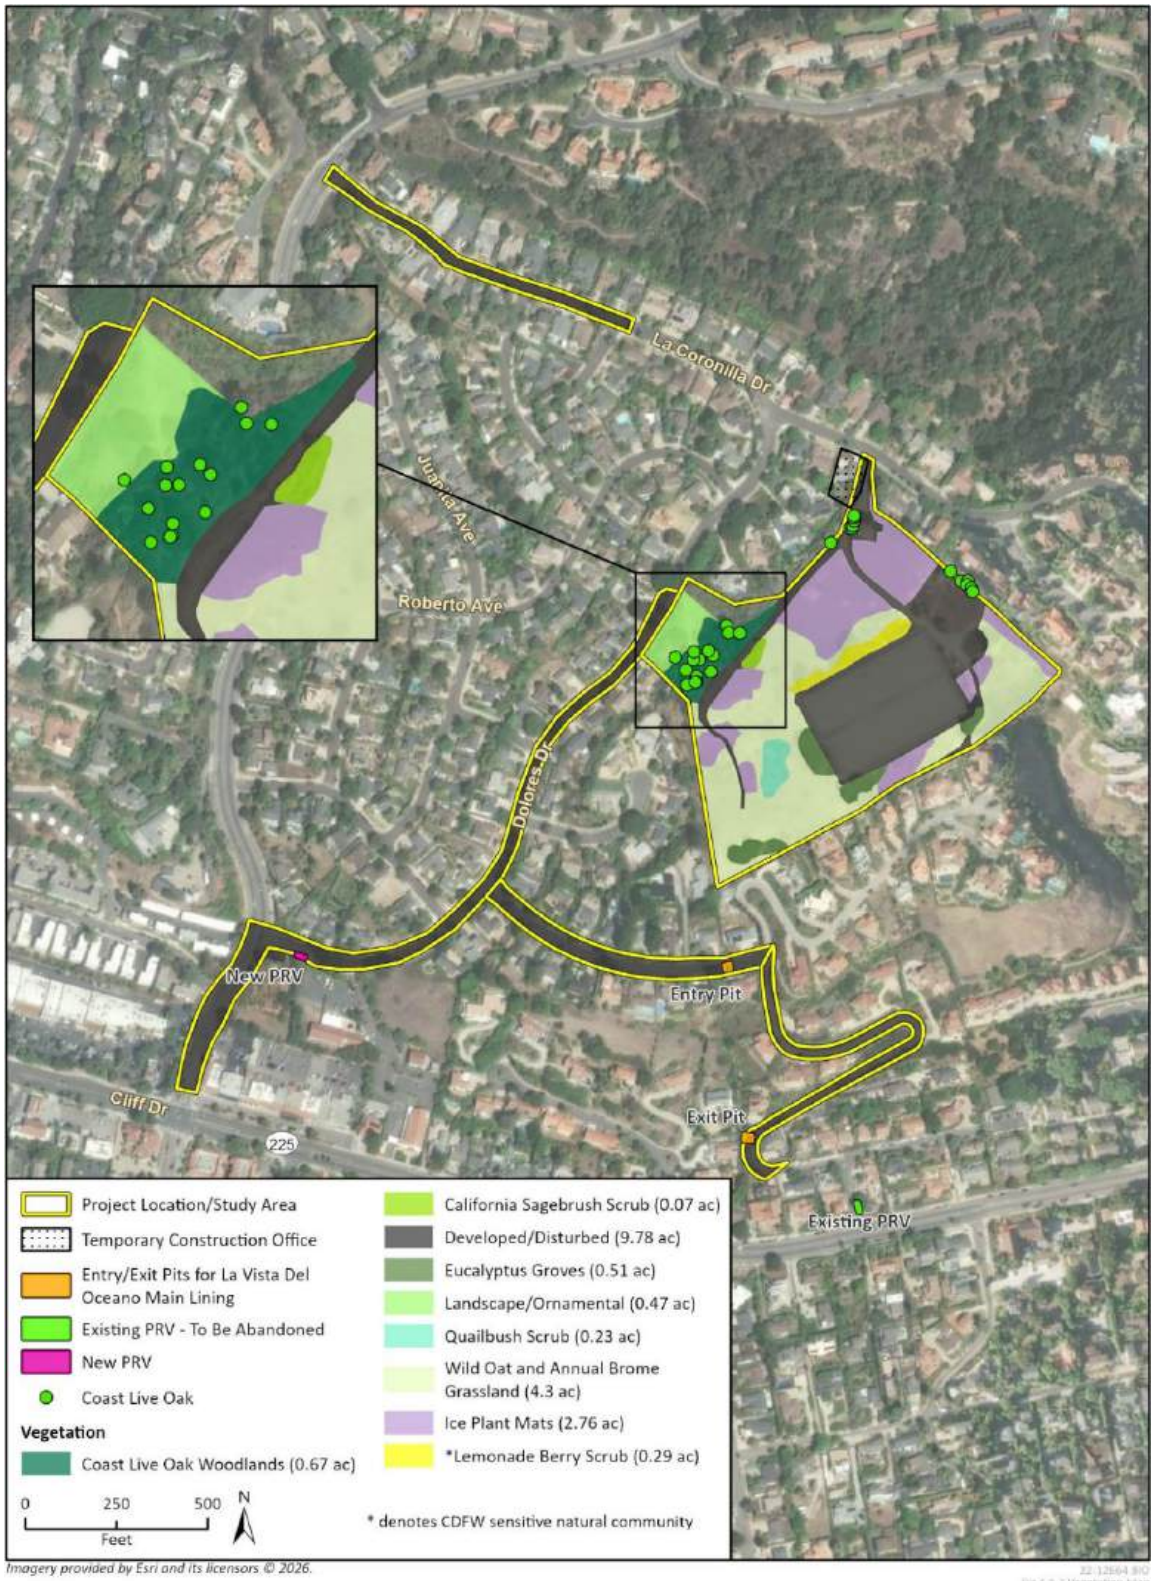
CALIFORNIA SAGEBRUSH SCRUB (ARTEMISIA CALIFORNICA SHRUBLAND ALLIANCE)

California sagebrush scrub (*Artemisia californica* Shrubland Alliance) is typically found along slopes that are steep and rarely flooded, or on low-gradient deposits along streams between zero and 3,940 feet above mean sea level. Soils in sagebrush scrub communities are typically alluvial or colluvial derived and shallow. This vegetation community is not considered a CDFW sensitive natural community.

California sagebrush scrub is present in the Project site and is located generally east of La Coronilla Park within the Vic Trace Reservoir parcel on a northwest facing slope. Onsite California sagebrush is surrounded by non-native grassland and ice plant mats.

[2] Sawyer, J.O., T. Keeler-Wolf, and J.M. Evens. 2009. A Manual of California Vegetation, 2nd edition. California Native Plant Society, Sacramento, California.

Figure 4.3-1 Vegetation Communities and Land Cover Types[3]



[3] Note that the Project location extends along La Coronilla between Vales Street and the Project driveway.

COAST LIVE OAK WOODLAND AND FOREST (QUERCUS AGRIFOLIA FOREST AND WOODLAND ALLIANCE)

Coast live oak woodland and forest (*Quercus agrifolia* Forest and Woodland Alliance) is a warm temperate woodland/forest vegetation community that typically occurs along canyon bottoms, slopes, and flats where soils are deep, high in organic matter, and contain sand or loam. Typically, coast live oak is dominant or codominant in the tree canopy where it must contain 50 percent or greater relative cover. Common co-dominants and associates found with coast live oaks include big leaf maple (*Acer macrophyllum*), valley oak (*Quercus lobata*), and California bay (*Umbellularia californica*). The tree canopy is typically open to continuous; the shrub layer is sparse to intermittent; and the herbaceous layer is sparse to continuous. This vegetation community is not considered a CDFW sensitive natural community.

This vegetation community is located on a northwest facing slope between La Coronilla Park and the Vic Trace Reservoir. Coast live oak is the dominant species within the park hillslope area and contains continuous to intermittent canopy cover. The shrub stratum is generally dominated by California sagebrush and coyote brush (*Baccharis pilularis*). The herbaceous understory is sparse and consists of non-native forbs and annual grasses.

EUCALYPTUS GROVE (*EUCALYPTUS* SPP. SEMI-NATURAL ALLIANCE)

The eucalyptus grove (*Eucalyptus* spp. Semi-Natural Alliance) vegetation community is found planted as trees, groves, and windbreaks, as well as in settings where it has become naturalized on uplands or bottomlands and adjacent to stream courses, lakes, or levees from sea level to 1,900 meters in elevation. Eucalyptus species typically consist of over 80 percent cover within the tree layer. The understory of this community is generally poorly developed or composed of low-growing forbs and non-native grasses due to the excessive shade and possibly toxic properties produced by the eucalyptus leaf litter. This vegetation community is not considered a CDFW sensitive natural community.

Stands of red iron bark (*Eucalyptus sideroxylon*) border the southern and center of the Vic Trace Parcel's reservoir structure. Black locust (*Robinia pseudoacacia*) trees are also present intermittently throughout this vegetation community, with non-native grasslands, lemonade berry, and ice plant mats growing outside the tree canopy footprint.

ICE PLANT MATS (*CARPOBROTUS* SPP. HERBACEOUS SEMI-NATURAL ALLIANCE)

Ice plant mats (*Carpobrotus* spp. Herbaceous Semi-Natural Alliance) typically occur on bluffs, disturbed, land, and sand dunes near the coastline between sea level and 10 meters in elevation. Ice plant mats are typically intermittent to continuous herbaceous layer And ice plant species (*Carpobrotus* spp.) are typically the most dominant. This vegetation community is not considered a CDFW sensitive natural community.

Ice plant mats are present in several areas within the Vic Trace Reservoir parcel with ice plant forming a dense carpet, limiting the presence of other vegetation. California sagebrush occurs infrequently among the ice plant with non-native grasses and forbs filling gaps in the ice plant mats.

LEMONADE BERRY SCRUB (*RHUS INTEGRIFOLIA* SHRUBLAND ALLIANCE)

Lemonade berry scrub (*Rhus integrifolia* Shrubland Alliance) typically occurs in sloped landscapes and on coastal bluffs where loam and clay soils are present. This community occurs between 5 and 750 meters in elevation, generally along the coast in southern California. Lemonade berry consists

of 50 percent or more of the relative cover within the shrub stratum (Sawyer et al. 2009). Lemonade berry scrub is considered a CDFW sensitive natural community.

Within the Vic Trace Reservoir parcel, there is a stand of lemonade berry scrub along the northwest side of the constructed reservoir. Lemonade berry scrub is the dominant species in this particular area with California sagebrush and toyon also present. Eucalyptus is intermittent in tree canopy and non-native forbs and shrubs are present in the herbaceous understory where canopy gaps occur.

QUAILBUSH SCRUB (*ATRIPLEX LENTIFORMIS* SHRUBLAND ALLIANCE)

Quailbush scrub is an alkaline saltbush scrub community that typically occurs on south facing slopes or adjacent to alkaline washes or dry lakebeds on clay soils. Quailbush (*Atriplex lentiformis*) or Torrey's saltbush (*Atriplex torreyi*) are dominant where either species must have greater than 50 percent relative cover in the shrub canopy. The shrub canopy is open to intermittent and California sagebrush (*Artemisia californica*), four-wing saltbush (*Atriplex canescens*), arrow weed (*Plucea sericea*) and tamarisk (*Tamarix* spp.) may be present as common associates. The herbaceous layer is variable, and the emergent trees may be present at low cover. This vegetation community is not considered a CDFW sensitive natural community.

Within the Project site, quailbush scrub is present southwest of the constructed reservoir on the Vic Trace Reservoir parcel. Quailbush scrub cover is dominant where it occurs and has a contiguous to intermittent canopy. Non-native grasses and forbs are present in the understory between shrubs.

WILD OATS AND ANNUAL BROME GRASSLANDS (AVENA SPP. – BROMUS SPP. HERBACEOUS SEMI-NATURAL ALLIANCE)

Wild oats and annual brome grasslands (*Avena* spp. – *Bromus* spp. Herbaceous Semi-Natural Alliance) are generally found in open areas in valleys and foothills throughout coastal and interior California. It typically occurs on soils consisting of fine-textured loams or clays that are somewhat poorly drained. Non-native annual grasses and weedy annual and perennial forbs, primarily of Mediterranean origin, dominate this vegetation type, probably as a result of human disturbance. Scattered native grass and wildflower species, representing remnants of the original vegetation may also be common (Sawyer et al. 2009). This vegetation community is not considered a CDFW sensitive natural community.

Wild oats and annual brome grasslands occur on the Vic Trace Reservoir parcel in open areas that separate the ice plant mats, shrub/scrub areas, and tree stands. These areas are dominated by non-native grasses such as wild oat (*Avena barbata*), brome species (*Bromus* spp.), Bermuda grass (*Cynodon dactylon*), short-podded mustard (*Hirschfeldia incana*), and other species that were unidentifiable due to mowing of the vegetation.

Land Cover Types

DISTURBED/DEVELOPED

The disturbed/developed land cover type consists of areas that have been developed or otherwise physically altered to the extent that they no longer support most vegetation. Developed land is characterized by the presence of structures, gravel lots, pavement, or hardscape. This land cover type may also contain areas that are sparsely vegetated, primarily with ornamental and/or invasive species.

Within the Project site, disturbed/developed land is associated with the roadways and infrastructure serving the Vic Trace Reservoir, and developed streets outside the Vic Trace Reservoir parcel along La Coronilla Drive, Dolores Drive, Meigs Road, Ricardo Avenue, and La Vista Del Oceano. The ground generally contains asphalt, pavement, or modified soils. A trace amount of landscape/ornamental and/or non-native annual herbaceous species is present surrounding these features but do not provide enough cover to constitute their own land cover type.

LANDSCAPE/ORNAMENTAL

The landscape/ornamental land cover type consists of human-altered vegetative landscapes for aesthetic or recreational purposes. Within the Project site, this land cover type is located within La Coronilla Park between Dolores Drive and the coast live oak woodland to the east, where the park is planted with landscape succulents and shrubs. Open areas within this cover type are dominated by non-native grasses.

Special-Status Species

Assessments for the potential occurrence of special status species are based upon known ranges, habitat preferences for the species, species occurrence records from the CDFW's California Natural Diversity Database (CNDDB) and other sources, species occurrence records from other sites in the vicinity of the survey area, previous reports for the Project site, and the results of surveys of the Project site. The potential for each special status species to occur in the Project site was evaluated according to the following criteria:

- **No Potential.** Habitat on and adjacent to the site is clearly unsuitable for the species requirements (foraging, breeding, cover, substrate, elevation, hydrology, plant community, site history, disturbance regime), and species would have been identifiable on the site if present (e.g., oak trees). Protocol surveys (if conducted) did not detect species.
- **Low Potential.** Few of the habitat components (foraging, breeding, cover, substrate, elevation, hydrology, plant community, site history, disturbance regime) meeting the species requirements are present, and/or the majority of habitat on and adjacent to the site is unsuitable or of very poor quality. The species is not likely to be found on the site. Protocol surveys (if conducted) did not detect species.
- **Moderate Potential.** Some of the habitat components (foraging, breeding, cover, substrate, elevation, hydrology, plant community, site history, disturbance regime) meeting the species requirements are present, and/or only some of the habitat on or adjacent to the site is unsuitable. The species has a moderate probability of being found on the site.
- **High Potential.** All the habitat components (foraging, breeding, cover, substrate, elevation, hydrology, plant community, site history, disturbance regime) meeting the species requirements are present and/or most of the habitat on or adjacent to the site is highly suitable. The species has a high probability of being found on the site.
- **Present.** Species is observed on the site or has been recorded (e.g., CNDDB, other reports) on the site recently (within the last 5 years).

The literature and database review identified 69 special-status plant and animal species that are known to occur in the vicinity of the Project site. Of these 69 species, ten species (five plants and five animals) were determined to have potential to occur in the Project site. Each of these ten special-status species, its listing status, and its determination of potential to occur are presented in Table 4.3-2. Nine of these species were determined to have a low potential to occur. While the

Project site contains elements of potentially suitable habitat for these species, this habitat is limited in size, previously disturbed, surrounded by development, and isolated from larger stands of contiguous habitat. These factors substantially reduce the potential for occurrence. One species, white-tailed kite (*Elanus leucurus*), was determined to have moderate potential to occur.

Fifty-nine special-status species identified during the literature and database review are not anticipated to occur based on a variety of factors, including the lack of suitable habitat and/or the Project site location in relation to the species' known geographic and/or elevation range(s). Species that may only occur as occasional transients during limited foraging or migratory movements were not considered to have potential to occur on the Project site because the site does not provide suitable stopover habitat, breeding habitat, or other resources necessary to support occupancy. Appendix D includes the potential to occur determinations and justification on those determinations for all special-status species identified during the literature and database review along with their listing statuses, habitat requirements, and habitat suitability/observation notes. A more detailed discussion of the one State fully protected species that has a moderate potential to occur, white-tailed kite, is provided below Table 4.3-2.

Table 4.3-2 Special-Status Species with Potential to Occur within the Study Area

Scientific Name	Common Name	Status[1]	Potential to Occur
Plants			
Amsinckia douglasiana	Douglas' fiddleneck	LR	Low
Astragalus didymocarpus var. *milesianus*	Miles' milk-vetch	CRPR 1B.2	Low
Calandrinia breweri	Brewer's calandrinia	LR	Low
Calochortus catalinae	Catalina mariposa-lily	LR	Low
Phacelia hubbyi	Hubby's phacelia	LR	Low
Reptiles			
Aspidoscelis tigris stejnegeri	Coastal whiptail	SSC	Low
Phrynosoma blainvillii	Coast horned lizard	SSC	Low
Salvadora hexalepis virgultea	Coast patch-nosed snake	SSC	Low
Birds			
Elanus leucurus	White-tailed kite	FP	Moderate
Mammals			
Lasiurus frantzii	Western red bat	SSC	Low

[1] FP = State Fully Protected; SCE = State Candidate Endangered; SSC = Species of Special Concern; LR = Locally Rare (Santa Barbara Botanical Gardens, Wilken 2018); CRPR 1B.2 = Plants rare, threatened, or endangered in California and elsewhere

White-Tailed Kite

White-tailed kite, a State fully protected species, regularly breeds along the Santa Barbara coastline. This species nests in trees, usually with a dense canopy, but nest trees can vary from single, isolated trees to trees within large woodlands, including (in order of frequency used) oaks, pines, Monterey cypress, eucalyptus, and willows. Nest and roost trees are often located in woodlands adjacent to grasslands, meadows, or marshes which are utilized as foraging habitat.

The Vic Trace parcel site provides suitable nesting and roosting habitat for the species, as coast live oak, eucalyptus, and other ornamental trees are currently present within the Project site. Additionally, this species has been recently documented within five miles of the Project site with the

closest occurrence record located approximately four miles west, within the More Mesa Open Space. However, the Project site is frequently mowed, contains a degree of disturbance, and is completely surrounded by urban/developed land, all of which reduces the suitability of habitat.

Other Protected Species

Nesting Birds

The Project site contains habitat that can support nesting birds, including raptors, protected under California Fish and Game Code (CFGC) Section 3503 and the Migratory Bird Treaty Act (MBTA) (16 United States Code Sections 703–712). Potential nesting sites for raptors are located within the eucalyptus, coast live oak, and ornamental trees scattered throughout the Project site. These trees, along with the Vic Trace parcel's native shrubs, landscape/ornamental vegetation, and developed structures also have the potential to support other species of nesting birds.

Sensitive Natural Communities

Vegetation communities are considered sensitive biological resources if they have limited distributions, have high-wildlife value, include special-status species, or are particularly susceptible to disturbance. The CDFW ranks natural and sensitive communities using NatureServe's Heritage Methodology, the same system used to assign global and state rarity ranks for plant and animal species in the CNDDB. Plant communities with a rating of S1, S2, or S3 are considered sensitive communities by the CDFW.

The current Sensitive Natural Communities List was referenced to determine sensitivity status of the vegetation communities within the Project site. Lemonade berry scrub is present on the Project site and is currently ranked as an S3. S3 plant communities are vulnerable in the state due to a restricted range, relatively few populations, recent and widespread declines, or other factors making them vulnerable to extirpation (i.e., localized extinction).

4.3.2 Regulatory Setting

a. Federal Regulations

Federal Endangered Species Act

The federal Endangered Species Act (ESA) protects federally listed wildlife species from harm or take, which is broadly defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in any such conduct." Take can also include habitat modification or degradation that directly results in death or injury of a listed wildlife species. An activity can be defined as take even if it is unintentional or accidental. Listed plant species are legally protected from take under the federal ESA only if they occur on federal lands. United States Fish and Wildlife (USFWS) and the National Marine Fisheries Service have jurisdiction over federally listed, threatened, and endangered plant and animal species under the federal ESA. USFWS also maintains lists of proposed and candidate species, which are not legally protected under the federal ESA, but may become listed in the near future.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (16 United States Code Section 703) prohibits killing, possessing, or trading of migratory protected birds except in accordance with regulations prescribed by the

Secretary of the Interior. The Migratory Bird Treaty Act protects whole birds, parts of birds, and bird eggs and nests, and prohibits the possession of all nests of protected migratory bird species whether they are active or inactive. Nest starts (nests that are under construction and do not yet contain eggs) and inactive nests are not protected from destruction.

b. State Regulations

California Endangered Species Act

The California Endangered Species Act (CESA) (CFGC, Chapter 1.5, Sections 2050-2116) prohibits the take of any plant or animal listed (protected) under CESA or proposed for listing as rare (plants only), threatened, or endangered. In accordance with CESA, the CDFW has jurisdiction over state-listed species (CFGC 2070). The CDFW regulates activities that may result in take of individuals (i.e., "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill").

California Fish and Game Code

The California Fish and Game Code (CFGC) Sections 3503, 3513, and 3800 (and other sections and subsections) protect native birds, including their nests and eggs, from all forms of take. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered take by the CDFW. Raptors (i.e., eagles, hawks, and owls) and their nests are specifically protected in California under CFGC Section 3503.5. Section 3503.5 states that it is "unlawful to take, possess, or destroy any birds in the order Falconiformes or Strigiformes (birds of prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this code or any regulation adopted pursuant thereto."

National Pollutant Discharge Elimination System Construction General Permit

Construction projects in California causing land disturbances that are equal to 1 acre or greater must comply with state requirements to control the discharge of stormwater pollutants under the National Pollutant Discharge Elimination System General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Construction Stormwater General Permit; Water Board Order No. 2022-0057-DWQ). Prior to the start of construction/demolition, a Notice of Intent must be filed with the SWRCB describing the project. A Stormwater Pollution Prevention Plan must be developed and maintained during construction of the project and it must include the use of best management practices to protect water quality until the site is stabilized.

c. Local Regulations

City of Santa Barbara General Plan

The Environmental Resources Element of the City of Santa Barbara 2011 General Plan (City of Santa Barbara 2011[4]) includes goals to protect the biological resources found within the city. The Environmental Resources Element has relevant policies that pertain to this Project.

- **ER11: Native and Other Trees and Landscaping.** Protect and maintain native and other urban trees, and landscaped spaces, and promote the use of native or Mediterranean drought-tolerant species in landscaping to save energy and water, incorporate habitat, and provide shade.

[4] City of Santa Barbara. 2011. Santa Barbara's General Plan. https://santabarbaraca.gov/government/priorities-policies/general-plan/general-plan-elements-appendices (accessed January 2026).

- **ER15: Creek Resources and Water Quality.** Encourage development and infrastructure that is consistent with City policies and programs for comprehensive watershed planning, creeks restoration, water quality protection, open space enhancement, storm water management, and public creek and water awareness programs.
- **ER17: Creek Setbacks, Protection, and Restoration.** Protection and restoration of creeks and their riparian corridors is a priority for improving biological values, water quality, open space and flood control in conjunction with adaptation planning for climate change.

City of Santa Barbara Municipal Code

Chapters 15.20, 15.24, and 22.10 of the Santa Barbara Municipal Code (SBMC) are the relevant ordinances that pertain to this Project.

- Chapter 15.20 of the SBMC requires a permit to "plant, prune, trim, perform maintenance on, or remove any tree planted in a parkway strip, tree well, public area[5] or street right-of-way trees" in a City street Right of Way (ROW).
- Chapter 15.20 of the SBMC requires a permit to "remove or significantly alter or to authorize or allow the removal or significant alteration of any of the following trees without a permit: A setback tree; a parking lot tree; a tree on an approved plan; or a tree designated as an historic or specimen tree by the City Council.
- Chapter 22.10 requires a permit to "cause to have done or perform vegetation removal on any site in the Hillside Design District". Exemptions from the permit requirement include:
  - The total area of native vegetation removal is less than 1,000 square feet within a period of one year, and not exceeding 3,000 square feet in any five-year period…The total area of non-native vegetation removal is less than 2,000 square feet within a period of one year, and not exceeding 6,000 square feet in any five year period…The average slope of the removal site and access…is less than 20%.
  - The removal or destruction of vegetation by public utilities on existing rights-of-way or property owned by such utility or existing access rights-of-way to such utility rights-of-way or property…[or] by public agencies on publicly owned property or rights-of-way for trails, roads, highways, streets, flood control projects or other similar or related public uses…[or] in connection with work performed under a valid grading permit.

4.3.3 Impact Analysis

a. Significance Criteria and Methodology

Significance Criteria

Considering the biological resources present on the Project site, and in accordance with Appendix G of the *CEQA Guidelines*, an impact related to biological resources would be significant if the proposed Project would:

1. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S Fish and Wildlife Service.

[5] "Public Areas" includes parks, playgrounds, areas around public buildings and all other areas under the supervision and maintenance of the City not including any street right-of-way.

2. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.
5. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

As mentioned above, the Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 3, 4, and 6 would be less than significant or have no impact. These impacts are discussed in the Initial Study Environmental Checklist Section 4, Biological Resources (Appendix A). Thus, the following discussion solely focuses on Thresholds 1, 2, and 5.

Methodology

A reconnaissance-level field survey and delineation was conducted on July 13, 2023, by City approved Biologists Melissa Pechter and Casey Clark to document the existing site conditions and the potential presence of sensitive biological resources, including sensitive plant and wildlife species, sensitive plant communities, jurisdictional waters and wetlands, and habitat for nesting birds. An inventory of native plant and animal species observed during the site visits was compiled. A literature review was conducted for baseline information on biological resources potentially occurring at the project site and surrounding area. The literature review included site-specific and surrounding reports, information in peer-reviewed journals, and standard and location-specific reference materials. The *Biological Resources Assessment Report for the Vic Trace Reservoir Replacement Project* (Appendix D) summarizes the results of the field survey and delineation, species inventory, and literature review, as well as provides an impact analysis regarding Project impacts to biological resources.

b. Project Impacts and Mitigation Measures

Threshold 1:	Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S Fish and Wildlife Service?

Impact BIO-1 CONSTRUCTION OF THE PROJECT HAS THE POTENTIAL TO RESULT IN DIRECT AND INDIRECT IMPACTS TO SPECIAL-STATUS WILDLIFE SPECIES. OPERATION OF THE PROJECT WOULD BE SIMILAR TO EXISTING CONDITIONS AND WOULD HAVE A LESS THAN SIGNIFICANT IMPACT TO SPECIAL-STATUS SPECIES. FOLLOWING IMPLEMENTATION OF MITIGATION MEASURES BIO-1 THROUGH BIO-4, THE PROJECT'S CONSTRUCTION IMPACT WOULD BE LESS THAN SIGNIFICANT WITH MITIGATION.

Special-Status Plant Species

No special-status plant species were observed within the Project site during the reconnaissance-level field survey. Five special-status plant species have a low potential to occur within the Project Site, including Douglas' fiddleneck (*Amsinckia douglasiana*), Miles' milk-vetch (*Astragalus didymocarpus* var. *milesianus*), Brewer's calandrinia (*Calandrinia breweri*), Catalina mariposa-lily (*Calochortus catalinae*), and Hubby's phacelia (*Phacelia hubbyi*). While the Project site contains elements of potentially suitable habitat for these species, this habitat is limited in size, previously disturbed, surrounded by development, and isolated from larger stands of contiguous habitat. These factors substantially reduce the potential for occurrence.

Due to the limited habitat within the Project site and low potential for special-status plant species to occur, the number of plant individuals affected by the Project would be low, if any, and would not result in population-level effects on these species. Indirect impacts to special-status plant species potentially occurring outside of the Project site could occur from dust generated during construction, but would be minor as the Project site is also surrounded by development. Therefore, Project-related construction impacts to special-status plant species would be less than significant.

Operation and maintenance (associated with the Vic Trace Reservoir) of the proposed project would be similar to existing conditions. Therefore, operation and maintenance activities would have a less than significant impact on special-status plant species.

Special-Status Wildlife Species

One fully protected species, white-tailed kite, has a moderate potential to occur within the Project site. This species may utilize suitable nesting and roosting habitat, such as large coast live oak, eucalyptus, and other ornamental trees located within the Project's Vic Trace Reservoir parcel. Suitable nesting habitat for the species may be impacted by the Project. Should individuals of white-tailed kite occur on or adjacent to the Project site during construction, direct impacts could include injury or mortality from construction vehicles or equipment. These impacts would be potentially significant. Implementation of Mitigation Measures BIO-1 through BIO-4 would reduce potential direct impacts to white-tailed kite to a less than significant level.

Indirect construction impacts to white-tailed kite could occur through vehicle maintenance and the potential for chemical leaks or spills outside developed areas to result in contamination that could affect individuals or their habitat. However, the Project would be required to implement standard construction Best Management Practices (BMPs) that are already mandated under existing regulations, including the Clean Water Act and Porter-Cologne Water Quality Control Act. In addition, construction activities would be subject to the City of Santa Barbara's local grading, stormwater, and construction management requirements, which are more stringent than State and federal minimum standards and include detailed site-specific erosion control, spill prevention, and inspection measures enforced through City permits and conditions of approval. BMPs would include measures to prevent off-site tracking, protect water quality, maintain equipment to avoid leaks, manage trash and food waste, control dust, and limit vehicle speeds. Furthermore, standard construction site management practices would prohibit pets on-site, thus preventing domestic animals from disturbing, preying upon, or otherwise harassing wildlife, including white-tailed kite and other special-status species that may occur on or adjacent to the Project area. Implementation of these BMPs as required under existing regulations and Project permits (e.g., National Pollutant Discharge Elimination System Construction Stormwater General Permit) would minimize or substantially reduce indirect impacts that could otherwise affect white-tailed kite, such that indirect impacts would be less than significant.

Four additional special-status wildlife species were determined to have potential to occur within the Project site based upon known ranges, habitat preferences for the species, and species occurrence records from CNDDB: Coastal whiptail (*Aspidoscelis tigris stejnegeri*), coast horned lizard (*Phrynosoma blainvillii*), coast patch-nosed snake (*Salvadora hexalepis virgultea*), and western red bat (*Lasiurus frantzii*). These four species have a low potential to occur within the Project site because marginally suitable habitat for these species (rocky or vegetated drainages with limited or no riparian vegetation) is present adjacent but outside of the Project site. Project-related construction impacts to these four special-status species would be less than significant.

Operation and maintenance of the proposed Project would be similar to existing conditions. Therefore, operation and maintenance activities would have a less than significant impact on special-status wildlife species.

Nesting Birds

The Vic Trace Reservoir parcel contains habitat which can support nesting birds, including raptors, protected under the CFGC and the MBTA. The native, non-native, and ornamental vegetation throughout the Project site provides suitable nesting habitat for avian species. Specifically, the mature coast live oak and eucalyptus trees throughout the Project site contain suitable habitat for raptor species while the various ornamental and coastal scrub shrub layers provide suitable habitat for passerine species. Potentially significant direct impacts to raptors and other nesting birds may result if construction occurs while they are present within or adjacent to the Project footprint, through direct mortality or abandonment of nests. Indirect impacts to nesting birds due to the loss of trees or suitable habitat may also occur and are addressed under Impact BIO-3. Implementation of Mitigation Measures BIO-1 through BIO-4 would reduce potential impacts to nesting birds to a less than significant level.

Mitigation Measures

BIO-1 Worker Environmental Awareness Program

Prior to the start of construction, all Project construction personnel shall attend an in-person Worker Environmental Awareness Program (WEAP) training, conducted by a City-approved biologist, to assist workers in recognizing biological resources which may occur in the Project area. The specifics of this program shall include:

- Identification of special-status species with potential to occur in the Project area;
- A description of the regulatory status and general ecological characteristics of special-status species with potential to occur;
- A review of the limits of construction and measures required to avoid and minimize impacts to biological resources within the work area; and
- Information regarding nesting birds.

The City-approved biologist shall have the discretion to determine whether additional sensitive biological resources are included within the WEAP training. Project construction personnel shall sign a form provided by the trainer documenting they have attended the WEAP and understand the information presented to them. The Project contractor shall be responsible for ensuring crew members adhere to the guidelines and restrictions designed to avoid impacts to special-status species. When new construction personnel are added to the Project, the contractor shall confirm the new personnel receive the WEAP training before starting work. The training of personnel can include a video recording and/or the use of written materials rather than in-person training by the City-approved biologist.

BIO-2 Nesting Bird Management Plan

Prior to the start of construction, the City shall approve a Nesting Bird Management Plan for the Project. The Nesting Bird Management Plan shall be prepared by a City-approved biologist and shall include measures to avoid the unauthorized take or destruction of birds, eggs, or active nests,

consistent with the Migratory Bird Treaty Act and Sections 3503, 3503.5, 3511, and 3513 of the California Fish and Game Code. At a minimum, the Plan shall include:

- Procedures, such as surveys, for determining whether nesting birds are present at or near Project work areas;
- Procedures for assessing the species, nesting stage, and expected fledge date if nesting birds are present;
- Procedures for establishing protective buffers, to be assessed on a nest-specific basis considering the species concerned, the stage of nesting, the proposed work activities in proximity to the nest, and intervening vegetation or other factors that could attenuate impacts;
- Descriptions of allowed and prohibited activities within specific nest buffers, as well as procedures for allowing encroachment into buffers;
- Procedures for addressing pauses in construction which may result in changed environmental conditions or presence of new nests; and
- Procedures for addressing inadvertent injury to birds, including identification of appropriate wildlife rehabilitation facilities.

Requirements in the Nesting Bird Management Plan shall consider the season at which activities are occurring, and corresponding levels of avian activity and sensitivity.

BIO-3 Pre-Construction Presence/Absence Survey for Special-Status Wildlife Species

Within seven days prior to the commencement of ground-disturbing activities, a City-approved biologist shall be retained to perform a survey for white tailed kite, Coastal whiptail, coast horned lizard, coast patch-nosed snake, and western red bat in natural habitat areas within the Project footprint and an appropriate buffer to determine the presence/absence of these species. The pre-construction survey shall be conducted on foot within the Project footprint and buffer. The City-approved biologist shall temporarily move any identified special-status species to outside of the construction area, and if appropriate temporary barriers shall be employed to prevent the animal's ingress to the Project area. Construction shall not proceed until the work area is determined to be free of special-status species. The results of these surveys shall be documented in a technical memorandum and provided to the City.

BIO-4 Biological Construction Monitoring

A City-approved biological monitor shall be present during initial ground disturbing activities and vegetation removal to confirm impacts to special-status plant and wildlife species are avoided. The monitor shall have the authority to halt construction activities to avoid potential impacts to special-status species. The results of biological monitoring shall be recorded and provided to the City.

Significance After Mitigation

Project impacts would be potentially significant absent mitigation, but would be reduced to a less-than-significant level under CEQA through implementation of Mitigation Measures BIO-1 through BIO-4. These mitigation measures include a worker environmental training program for identification of special-status wildlife species (BIO-1), a Nesting Bird Management Plan (BIO-2) and special-status wildlife species surveys (BIO-3), and biological monitoring during construction (BIO-4). Following implementation of Mitigation Measures BIO-1 through BIO-4, the proposed Project's

impact involving a substantial adverse effect on special-status species or their habitat would be less than significant with mitigation incorporated.

Threshold 2:	Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Impact BIO-2 CONSTRUCTION OF THE PROJECT HAS THE POTENTIAL TO RESULT IN DIRECT IMPACTS TO LEMONADE BERRY SCRUB, A SENSITIVE NATURAL COMMUNITY. FOLLOWING THE IMPLEMENTATION OF MITIGATION MEASURE BIO-5, THIS IMPACT WOULD BE LESS THAN SIGNIFICANT WITH MITIGATION.

One sensitive natural community occurs within the Project site: lemonade berry scrub (*Rhus integrifolia* shrubland alliance), which is listed on the CDFW's Sensitive Natural Communities List (Appendix D).

The proposed Project would result in the complete removal of the existing, 0.29-acre lemonade berry scrub, which is located entirely within the footprint of the proposed replacement reservoirs, via excavation and grading around the existing reservoir during construction. As the existing area of lemonade berry scrub would be completely redeveloped, restoration or re-establishment of the lemonade berry scrub within its current location would not be feasible. Consequently, this direct impact would constitute a permanent loss of lemonade berry scrub, and would represent a potentially significant impact requiring compensatory mitigation to offset the loss of this sensitive natural community.

Implementation of Mitigation Measure BIO-5 would reduce potential impacts to sensitive natural communities to a less than significant level.

Mitigation Measures

BIO-5 Lemonade Berry Scrub Restoration Plan

The City shall retain a City-approved biologist/restoration ecologist to prepare a Lemonade Berry Scrub Restoration Plan (RP) designed to offset construction-related impacts to lemonade berry scrub within the Project site.

The RP shall provide compensatory restoration at a minimum ratio of 1:1 (e.g. 0.29 acre of lemonade berry scrub). Performance standards to be included in the RP shall be tied to measurable outcomes, such as percent native cover, species composition, and shrub survival rates.

The RP shall include the following:

- A description of the impacted lemonade berry scrub
- A plant palette and methods of salvaging (including topsoil salvage), propagating, seeding, and/or planting the site to be restored;
- A schedule for restoration activities, that may include weed abatement, propagating and planting, soil preparation, and/or erosion control;
- Performance standards including: (1) survival of installed shrubs (e.g., 80 percent survival after two years), (2) native cover targets matched to reference conditions, and (3) absence thresholds for invasive species;

- Maintenance and monitoring necessary to confirm the restoration area meets the success criteria; and
- Identification of contingency and adaptive management measures to address unforeseen changes in site conditions or other components of the restoration project.

Significance After Mitigation

The Project would include implementation of Mitigation Measure BIO-5, which would require preparation of a Restoration Plan and compensatory mitigation to offset the loss of the lemonade berry scrub. Following implementation of Mitigation Measure BIO-5, the proposed Project's impact involving a substantial adverse effect on sensitive natural communities would be less than significant with mitigation incorporated.

Threshold 5:	Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Impact BIO-3 CONSTRUCTION OF THE PROJECT WOULD INCLUDE THE REMOVAL OF TREES PROTECTED UNDER CITY OF SANTA BARBARA MUNICIPAL CODE SECTION 15.20. FOLLOWING THE IMPLEMENTATION OF MITIGATION MEASURE BIO-6, THIS IMPACT WOULD BE LESS THAN SIGNIFICANT WITH MITIGATION.

Several native and non-native trees are present within and adjacent to the Project site, including street trees occurring along the paved roadways where pipeline improvements are planned. Trees within a street right-of-way or public area, including on publicly-owned land such as the Vic Trace Reservoir parcel, are regulated under SBMC 15.20, and set-back trees on private property are regulated under SBMC 15.24. The Project would include the removal of approximately 55 trees regulated under SBMC 15.20, including 9 native and 46 non-native trees, which would be replaced by 75 trees on the Vic Trace Reservoir parcel. The Project is also located in the Hillside Design District, where vegetation and oak tree removals are regulated; however, public utility properties are exempt from permit requirements under SBMC 22.10. Prior to construction, the City - will obtain all required tree removal permits under SBMC Chapters 15.20 and 15.24.

Although the City intends to obtain all required permits and replace removed trees with 75 new trees on the Vic Trace Reservoir parcel, construction activities have the potential to affect additional regulated trees that are not currently proposed for removal. Such additional removals may become necessary if unforeseen conflicts arise during construction, including:

- Unanticipated root-zone disturbance beyond planned limits;
- Equipment maneuvering or safety clearances requiring removal of adjacent trees; or
- Structural destabilization of trees due to nearby grading or trenching.

The unplanned damage or removal of additional regulated trees would represent a greater loss of vegetation than anticipated. This potential for additional, unanticipated damage or removal of regulated native or non-native trees constitutes a potentially significant impact under CEQA. Implementation of Mitigation Measure BIO-6 would reduce potential impacts to a less than significant level.

Mitigation Measures

BIO-6 Tree Protection Plan

Prior to the start of construction, an International Society of Arboriculture Certified Arborist shall prepare a Tree Protection Plan (TPP) for any City-protected trees to be retained on site, including trees with a root zone or crown that may be affected by Project activities. Protected trees shall be defined as trees regulated under SBMC 15.20 and 15.24 with at least one trunk measuring 4 inches or greater in diameter at 4 feet 6 inches above the highest natural grade adjacent to the trunk, consistent with City Standards. The TPP shall include, at minimum, the following:

- An inventory of Project site trees with a root zone and/or crown that may be impacted by the Project.
- A graphic depiction of each protected tree and the limits of proposed Project activities that could affect protected trees, including ground disturbance and any clearance trimming.
- Tree protection measures, including:
  - Tree protection fencing, signage, and maintained condition for the duration of construction.
  - Prohibited activities near trees and specified limited activities permitted only under Certified Arborist supervision.
  - Root and crown protection and pruning standards.
  - Measures to maintain tree vigor during construction.
- Tree replacement measures and specifications that shall be incorporated into the Landscape Plan for the Project, including:
  - 75 replacement trees shall planted on site, as recommended at a City Department of Parks and Recreation hearing on February 25, 2026. The species of replacement trees shall be at the discretion of the City Arborist.
  - Replace any unanticipated removed trees, with trees of like species at a minimum 1:1 ratio.
  - Replacement trees shall be monitored and maintained for a minimum of two years or until success criteria is achieved.
  - Performance success criteria (e.g. 80 percent survival).

Significance After Mitigation

Mitigation Measure BIO-6 would reduce potential impacts to protected trees by requiring a Tree Protection Plan prior to construction. Following the implementation of Mitigation Measure BIO-6, the Project would be consistent with SBMC 15.20 and 15.24, and impacts would be less than significant with mitigation incorporated.

4.3.4 Cumulative Impacts

The geographic scope for potential cumulative impacts to biological resources is the City of Santa Barbara. This geographic scope is appropriate given the diversity of sensitive habitats within the city. Past, present, and reasonably foreseeable future projects include the projects listed in Table 3-1 in Chapter 3, *Environmental Setting*.

Cumulative development in the City of Santa Barbara would have the potential to disturb special-status species, riparian habitats, and sensitive natural communities. Existing City policies as well as federal and State regulations would protect special-status species, riparian habitats, and sensitive

natural communities during the course of cumulative project development. Individual development proposals are reviewed separately by the City and must undergo environmental review when it is determined that the potential for significant impacts exists. Cumulative projects listed in Table 3-1 in Chapter 3, *Environmental Setting*, would be required to implement mitigation measures, similar to the proposed Project, if it is determined that significant impacts for individual cumulative projects would occur. Nevertheless, cumulative development may have a potentially significant cumulative impact on biological resources, given the scope of anticipated development. Because the Project site is developed and largely lacks native vegetation, and because the Project would not remove or degrade riparian habitat or occupied habitat for special-status species, the Project would not appreciably add to the cumulative loss or fragmentation of sensitive biological resources. Therefore, the proposed Project would not have a considerable contribution to potential cumulative impacts.

Cumulative development would have the potential to conflict with biological resource plans and policies. However, individual cumulative projects would be required to implement mitigation measures, similar to the proposed project, if it is determined that significant impacts involving conflict with biological resource plans and policies for individual cumulative projects would occur. Therefore, cumulative development would have a less than significant cumulative impact involving conflict with biological resource plans and policies.

This page intentionally left blank.

4.4 Cultural/Tribal Cultural Resources

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to cultural or tribal cultural resources (TCRs) would be significant if the proposed Project would:

1. Cause a substantial adverse change in the significance of a historical resource pursuant to CEQA §15064.5.
2. Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA §15064.5.
3. Disturb any human remains, including those interred outside of formal cemeteries.
4. Cause a substantial adverse change in the significance of a TCR, defined in Public Resources Code Section §21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with important cultural value to a California Native American tribe, and that is:
    a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code §5020.1.1(k), or
    b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code §5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code §5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

The Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 1 and 3 would be less than significant or have no impact. These impacts are discussed in Initial Study Environmental Checklist Section 5, Cultural Resources, and Section 18, Tribal Cultural Resources (Appendix A). Thus, the following discussion solely focuses on Thresholds 2 and 4.

4.4.1 Environmental Setting

A portion of the Project site is located within the City's "Prehistoric Resources Period" sensitivity area. The "Prehistoric Resources Period" encompasses the period when Chumash populations established a complex settlement system across the south cost of the Santa Barbara Channel, including present-day Santa Barbara. The prehistory, Chumash ethnography, and historic developments of Santa Barbara are summarized in the City's Master Environmental Assessment (MEA) Guidelines for Archaeological Resources[1] and the City's MEA Guidelines for Tribal Cultural Resources.[2] As discussed under Section 4.4.2, the City of Santa Barbara defines historic resources to also include archaeological resources.

[1] Santa Barbara, City of. 2025. Master Environmental Assessment Guidelines for Archaeological Resources. https://santabarbaraca.gov/sites/default/files/2025-04/MEA%20Guidelines%20for%20Archaeological%20Resources%20%26%20Appendices.pdf (accessed February 2026).
[2] Santa Barbara, City of. 2025. Master Environmental Assessment Guidelines for Tribal Cultural Resources. https://santabarbaraca.gov/sites/default/files/2025-04/MEA%20Guidelines%20for%20Tribal%20Cultural%20Resources%20%26%20Appendices.pdf (accessed February 2026).

4.4.2 Regulatory Setting

a. Federal Regulations

National Register of Historic Places

Although the proposed project does not have a federal nexus, properties which are listed in or have been formally determined eligible for listing in the National Register of Historic Places (NRHP) are automatically listed in the California Register of Historical Resources (CRHR). The following is therefore presented to provide applicable regulatory context. The NRHP was authorized by Section 101 of the National Historic Preservation Act and is the nation's official list of cultural resources worthy of preservation. The NRHP recognizes the quality of significance in American, state, and local history, architecture, archaeology, engineering, and culture present in districts, sites, buildings, structures, and objects. Per 36 Code of Federal Regulations, Part 60.4, a property is eligible for listing in the NRHP if it meets one or more of the following criteria:

Criterion A: Is associated with events that have made a significant contribution to the broad patterns of our history

Criterion B: Is associated with the lives of persons significant in our past

Criterion C: Embodies the distinctive characteristics of a type, period, or method of installation, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction

Criterion D: Has yielded, or may be likely to yield, information important in prehistory or history

In addition to meeting at least one of the above designation criteria, resources must also retain integrity. The National Park Service recognizes seven aspects or qualities that, considered together, define historic integrity. To retain integrity, a property must possess several of these seven qualities, if not all, defined as follows:

Location: The place where the historic property was constructed or the place where the historic event occurred

Design: The combination of elements that create the form, plan, space, structure, and style of a property

Setting: The physical environment of a historic property

Materials: The physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property

Workmanship: The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory

Feeling: A property's expression of the aesthetic or historic sense of a particular period of time

Association: The direct link between an important historic event or person and a historic property

Certain properties are generally considered ineligible for listing in the NRHP, including cemeteries, birthplaces, graves of historical figures, properties owned by religious institutions, relocated structures, or commemorative properties. Additionally, a property must be at least 50 years of age

to be eligible for listing in the NRHP. The National Park Service states that 50 years is the general estimate of the time needed to develop the necessary historical perspective to evaluate significance. Properties which are less than 50 years must be determined to have "exceptional importance" to be considered eligible for NRHP listing.

b. State Regulations

California Environmental Quality Act

The California Environmental Quality Act (CEQA; Public Resources Code [PRC] Section 21084.1) requires that a lead agency determine whether a project could have a significant effect on historical resources. A "historical resource" is a resource listed in, or determined to be eligible for listing in, the CRHR (PRC Section 21084.1), a resource included in a local register of historical resources or identified as significant in an historical resource survey meeting the requirements of section 5024.1(g) of the PRC (*CEQA Guidelines* Section 15064.5[a][2]), or any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant (*CEQA Guidelines* Section 15064.5[a][3]).

PRC Section 5024.1, *CEQA Guidelines* Section 15064.5, and PRC Sections 21083.2 and 21084.1 were used as the basic guidelines for this cultural resources impact analysis. PRC Section 5024.1 requires the identification and evaluation of historical resources that may be affected by a project.

California Register of Historical Resources

The purpose of the CRHR is to maintain listings of the State's historical resources and to indicate which properties are to be protected from substantial adverse change. The criteria for listing resources in the CRHR were developed expressly to be in accordance with previously established criteria developed for listing in the NRHP, enumerated above under Federal Regulations.

According to PRC Section 5024.1(c)(1–4), a resource is considered historically significant if it 1) retains substantial integrity and 2) meets at least one of the following CRHR criteria:

1. It is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
2. It is associated with the lives of persons important in our past.
3. It embodies the distinctive characteristics of a type, period, region, or method of installation; or represents the work of an important creative individual; or possesses high artistic values.
4. It has yielded or may be likely to yield information important in prehistory or history.

Assembly Bill 52

Assembly Bill 52 (AB 52) was approved on September 25, 2014. The act amended PRC Section 5097.94, and added PRC Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3. The primary intent of AB 52 is to involve California Native American tribes early in the environmental review process and to establish a category of resources related to Native Americans, known as TCRs, that require consideration under CEQA. PRC Section 21074(a)(1) and (2) defines TCRs as "sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American Tribe" that are either included or determined to be eligible for inclusion in the CRHR or included in a local register of historical resources, or a resource that is determined to be a TCR by a lead agency, in its discretion and supported by substantial evidence. A TCR is further defined by PRC Section 20174(b) as a cultural landscape that meets the criteria of

subdivision (a) to the extent that the landscape is geographically defined in terms of the size and scope of the landscape. PRC Section 20174(c) provides that a historical resource described in Section 21084.1, a unique archaeological resource as defined in subdivision (g) of Section 21083.2, or a "nonunique archaeological resource" as defined in subdivision (h) of Section 21083.2 may also be a TCR if it conforms with the criteria of subdivision (a).

PRC Section 21080.3.1 requires that, within 14 days of a lead agency determining that an application for a project is complete, or a decision by a public agency to undertake a project, the lead agency provide formal notification to the designated contact, or a tribal representative, of California Native American tribes that are traditionally and culturally affiliated with the geographic area of the project (as defined in PRC Section 21073) and who have requested in writing to be informed by the lead agency of projects within their geographic area of concern.[3] Tribes interested in consultation must respond in writing within 30 days from receipt of the lead agency's formal notification and the lead agency must begin consultation within 30 days of receiving the tribe's request for consultation.[4]

PRC Section 21080.3.2(a) identifies the following as potential consultation discussion topics: the type of environmental review necessary; the significance of TCRs; the significance of the project's impacts on the TCRs; project alternatives or appropriate measures for preservation; and mitigation measures. Consultation is considered concluded when either: (1) the parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a TCR; or (2) a party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached.[5]

In addition to other CEQA provisions, the lead agency may certify an Environmental Impact Report (EIR) or adopt a Mitigated Negative Declaration for a project with a significant impact on an identified TCR, only if a California Native American tribe has requested consultation pursuant to Section 21080.3.1 and has failed to provide comments to the lead agency, or requested consultation but failed to engage in the consultation process, or the consultation process occurred and was concluded as described above, or if the California Native American tribe did not request consultation within 30 days.[6]

PRC Section 21082.3(c)(1) states that any information, including, but not limited to, the location, description, and use of the TCRs, that is submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public without the prior consent of the tribe that provided the information. If the lead agency publishes any information submitted by a California Native American tribe during the consultation or environmental review process, that information shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public.

Confidentiality does not apply to data or information that are, or become publicly available, already in lawful possession of the project applicant[7] before the provision of the information by the California Native American tribe, are independently developed by the applicant or the applicant's agents or are lawfully obtained by the project applicant from a third party that is not the lead agency, a California Native American tribe, or another public agency.[8]

c. Local Regulations

City of Santa Barbara General Plan

The City of Santa Barbara's 2011 General Plan Update Historic Resources Element describes goals, policies and implementation actions pertaining to historic and archaeological resources, including the protection and enhancement of historical resources, increased awareness and appreciation, governmental cooperation and neighborhood historic preservation (General Plan, Historic Resources Element [Adopted 2012] HR1) (City of Santa Barabara 2011). General Plan Policy HR1 is discussed in greater detail below.

Protection of Buildings, Structures, Sites and Features Policies

HR1. **Protect Historic and Archaeological Resources.** Protect the heritage of the City by preserving, protecting and enhancing historic resources and archaeological resources. Apply available governmental resources, devices and approaches, such as the measures enumerated in the Land Use Element of this [General] Plan, to facilitate their preservation and protection.

City of Santa Barbara Master Environmental Assessment Guidelines for Archaeological Resources

Pursuant to the City's *Master Environmental Assessment Guidelines*, the City of Santa Barbara (2025) defines significant historic resources to include, but not be limited to, the following:

1. Any "unique archaeological resource" as defined by CEQA §21083.2.g. Such "unique archaeological resources" are defined as

   ... *an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria*:

   (1) Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.

   (2) Has a special and particular quality such as being the oldest of its type or the best available example of its type.

   (3) Is directly associated with a scientifically recognized important prehistoric or historic event or person.

2. Any known significant archaeological site depicted on the City's Archaeological Resources Reports Location Map.
3. Any archaeological artifact, object, or site designated on the most current version of the following lists:
   a. National Historic Landmarks
   b. National Register of Historic Places
   c. California Registered Historical Landmarks
   d. California Register of Historical Resources
   e. City of Santa Barbara Landmarks
   f. City of Santa Barbara Structures of Merit

4. Any archaeological artifact, object or site meeting any or all the criteria established for a City Landmark and a City Structure of Merit (SBMC §22.22.040; Ord. 3900 ¶1, 1977), as follows:
   a. Its character, interest or value as a significant part of the heritage of the City, the State or the Nation;
   b. Its location as a site of a significant historic event;
   c. Its identification with a person or persons who significantly contributed to the culture and development of the City, the State or the Nation;
   d. Its exemplification of a particular architectural style or way of life important to the City, the State or the Nation;
   e. Its exemplification of the best remaining architectural type in a neighborhood;
   f. Its identification as the creation, design or work of a person or persons whose effort has significantly influenced the heritage of the City, the State or the Nation;
   g. Its embodiment of elements demonstrating outstanding attention to architectural design, detail, materials or craftsmanship;
   h. Its relationship to any other landmark if its preservation is essential to the integrity of that landmark;
   I. Its unique location or singular physical characteristic representing an established and familiar visual feature of a neighborhood;
   J. Its potential of yielding significant information of archaeological interest;
   k. Its integrity as a natural environment that strongly contributes to the wellbeing of the people of the City, the State or the Nation.

5. Any archaeological artifact, object or site meeting any or all the criteria provided for the National Register of Historic Places and the California Historical Landmark lists. Information regarding National Register Criteria for Evaluation and Considerations can be found in Section 2.1.2 NRHP.

4.4.3 Impact Analysis

a. Significance Thresholds and Methodology

Significance Thresholds

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to cultural or TCRs would be significant if the proposed Project would:

2. Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA §15064.5.

4. Cause a substantial adverse change in the significance of a TCR, defined in Public Resources Code Section §21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with important cultural value to a California Native American tribe, and that is:
   a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code §5020.1.1(k), or

b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code §5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code §5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

As mentioned above, the Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 1 and 3 would be less than significant or have no impact. These impacts are discussed in Initial Study Environmental Checklist Section 5, Cultural Resources, and Section 18, Tribal Cultural Resources (Appendix A). Thus, the following discussion solely focuses on Thresholds 2 and 4.

Methodology

The analysis in this section is based on the 2026 Historic Property Identification Report (HPIR) (Pfeiffer et al. 2026). The 2026 HPIR included a California Historical Resources Information System (CHRIS) records search through the Central Coast Information Center (CCoIC), a Sacred Lands File (SLF) search conducted by the Native American Heritage Commission (NAHC), historical topographic map and aerial imagery review, geoarchaeological review, geotechnical investigation review, mixed pedestrian and windshield field survey, and a Subsurface Phase 1 Investigation.

California Historical Resources Information System

On February 27, 2023, and July 1, 2023, Rincon received CHRIS records search results (#23-043 and #23-139) from the CCoIC currently located at the Santa Barbara Museum of Natural History. The CHRIS records search identified two previously recorded prehistoric archaeological resources (P-42-003850/CA-SBA-3850 and P-42-003851/CA-SBA-3851) and one built environment resource (P-42-041993/CA-SBA-41193) within a 0.5-mile radius of the Project site. One resource (P-42-003850/CA-SBA-3850) is located directly adjacent to the Project site and a description of the resource is provided in greater detail below. A review was also conducted of the NRHP, CRHR, California Historical Landmarks list, City of Santa Barbara List of Historic Landmarks and Structures of Merit, the Built Environment Resources Directory, and the Archaeological Determination of Eligibility list.

P-42-003850/CA-SBA-3850

P-42-003850/CA-SBA-3850 was initially recorded by Byron Bass in 2006 as a shell scatter in the vicinity of the Meigs Road and Dolores Drive intersection, measuring approximately 45 meters long by two to three meters wide (147.5 feet long by 6.5 to 10 feet wide) (Bass 2006b). A secondary scatter consisting of a few weathered shell fragments was also identified near the Meigs Road and Dolores Drive intersection in proximity to the Project site. The P-42-003850/CA-SBA-3850 site record states that the site "derives from slope wash and rodent burrows on the hillside adjacent to the sidewalk on the west side of Meigs Road." The shell was identified within homogenous soils and no additional artifacts were identified in association with the shell. P-42-003850/CA-SBA-3850 has not been previously evaluated for listing in the CRHR or NRHP.

Native American Heritage Commission Sacred Lands File

A SLF search and Assembly Bill 52 Native American contact list request was submitted to the NAHC on June 21, 2023. The NAHC responded on July 7, 2023, stating the results of the SLF search were negative for sacred lands in the vicinity of the Project site.

Archival and Background Research

Archival and background research was conducted to ascertain the development history of the Project site. A variety of primary and secondary source materials, including, but not limited to, historical maps, aerial photographs, and written histories of the area, were reviewed. Historical topographic maps from 1944 to 1953 depict the Project site as undeveloped land southwest of the Honda Valley and downtown Santa Barbara (NETR Online 2023; USGS 2023). From 1944 to 1953, the Project site was labeled Lavigia Hill, and there was some residential development along the coastline, to the south of the hill. Construction of the Vic Trace Reservoir in 1955 is confirmed by a 1967 aerial of the area (NETR Online 2023; *The Santa Barbara Star* March 17, 1955). The 1967 aerial also shows single-family residential development surrounding the Project site to the southeast and northwest (NETR Online 2023). Historic aerials from 1967 to 1984 and from 1994 to 2009 depict further single-family residential development south of the Project site (NETR Online 2023). Since 2009, the area has undergone only infill development (NETR Online 2023).

Geoarchaeological Review

Geologic mapping indicates three geologic units are mapped at the ground surface within the Project site, including the Santa Barbara Formation (Qsb), Quaternary marine terrace deposits (Qmt) and a lower calcareous unit (Tml) (Minor et al. 2009). These geologic units were deposited during the middle and lower Pleistocene (Qsb), upper Pleistocene (Qmt), and the lower and middle Miocene (Tml). The Pleistocene (approximately 2.6 million to 11,700 years ago) largely and the Miocene (approximately 23 to 5.3 million years ago) significantly pre-date human occupation of the region.

Soils within the Project site include an Arnold loamy sand series, Ayar clay series, and a Conception fine sandy loam series (California Soils Resource Lab 2025). None of the soil series identified within the Project site contain buried A-horizons, which are generally indicative of natural burial and preservation of archaeological deposits. Further, none of the geologic units were deposited during the Holocene (beginning approximately 11,700 years ago) which dates to human occupation of the region. Therefore, the geoarchaeological sensitivity is considered low.

Per the Minor et al. (2009) geologic map, the area around P-42-003850/CA-SBA-3850 is underlain by Quaternary marine terrace deposits, which preserve shallow-water marine environments and are known to preserve paleontological resources, including beds of mollusk fossils in Santa Barbara County (Minor et al. 2009; University of California Museum of Paleontology 2025).

Geotechnical Investigation Review

Geotechnical explorations conducted for this Project at the Vic Trace Reservoir parcel included drilling, downhole logging and sampling 11 borings to depths of 10 to 20.5 feet below the berm grade surrounding the reservoir. Subsurface conditions consist mainly of poorly consolidated sands and silts, with Santa Barbara Formation (Qsb) units beneath the northeastern berm and artificial fill beneath most other berm areas. The artificial fill, thickest along the southwestern berm (up to about 14.5 feet below the paved surface), was likely placed during grading for the reservoir in the 1950s. The original grading plan indicates that the bottom of the reservoir was cut into natural materials, and the finished surface at the perimeter was underlain by cut and fill areas (Earth Systems Southern California 2013).

Archaeological Field Survey

Due to extensive ground disturbances associated with modern development, the natural topography of the Project site has been substantially modified. As a result, large portions of the Project site including the La Coronilla Transmission Main corridor, Vic Trace Outlet Main corridor, Dolores Drive Main corridor, Ricardo Avenue Main corridor, and the La Vista Del Oceano Main Lining Entry Pit footprint within Ricardo Avenue are located in paved areas with no ground surface visibility. Therefore, an archaeological field survey, consisting of both a pedestrian survey and a windshield survey, was conducted on July 14, 2023. A subsequent pedestrian survey of the pipeline lining Exit Pit footprint on La Vista Del Oceano and windshield survey for the Entry Pit footprint on Ricardo Avenue was conducted on July 24, 2025.

The field survey conducted in July 2023 identified two shell fragments within disturbed fill soils within the Vic Trace Reservoir parcel, adjacent to the existing telecommunications facility. It is likely the shell fragments identified within the Vic Trace Reservoir parcel were imported with the fill material and gravel used to construct the reservoir, the communications facility, and access roads. The field survey also identified three weathered shell fragments adjacent to the Project site and within the previously recorded P-42-003850/CA-SBA-3850 boundaries, as well as very small shell fragments on the southern road shoulder of Dolores Drive, adjacent to the Project site, that have either been transported via erosion or redeposited outside of the previously recorded P-42-003850/CA-SBA-3850 boundaries.

Subsurface Phase 1 Archaeological Investigation

Given a portion of the Project site is located adjacent to a previously recorded resource (P-42-003850/CA-SBA-3850) and within the City's "Prehistoric Resources Period" sensitivity area, a Subsurface Phase 1 Archaeological Investigation was conducted to assess the presence or absence of subsurface archaeological deposits associated with P-42-003850/CA-SBA-3850 and determine the horizontal and vertical extent of any such deposits. The Vic Trace Outlet Main corridor and Dolores Drive Main corridor were not subject to the Subsurface Phase 1 Archaeological Investigation due to the corridors being within a paved, well-used roadway and the assumed previous disturbances associated with construction/installation of utilities under the roadway.

The Subsurface Phase 1 Archaeological Investigation, consisting of four shovel test pits/hand auger units (STPs/HAUs) excavated approximately two to four meters (6.5 to 13 feet) apart, was conducted on September 19, 2025. Native American monitoring for the investigation was conducted by Chairperson Eleanor Fishburn of the Barbareño Band of Chumash Indians.

Materials recovered from the Subsurface Phase 1 Archaeological Investigation included a total of 11 marine shell fragments within previously disturbed soils to a depth of 40 centimeters below surface (cmbs) in STP/HAU 1 (n=7) and 20 cmbs in STP/HAU 2 (n=4). No prehistoric material, such as flaked stone, groundstone or faunal bone, were identified in association with the shell fragments and no archaeological features or human remains were identified. One square cut nail was identified within previously disturbed soils in the 20 to 40 cmbs level of STP/HAU 1. The square cut nail is an isolated artifact originating from the historic-period; however, the nail was too degraded to allow for detailed analysis of its manufacturing characteristics. Isolated artifacts are typically ineligible for the NRHP and CRHR as their data potential is exhausted during initial recordation. The tested area has been previously disturbed from the construction and maintenance of a sidewalk, Meigs Road, and Dolores Drive. The presence of low-density unmodified shell without any associated archaeological materials does not conclusively represent an archaeological site, as there is no indication of human action or involvement in their disposition. Instead, the unmodified shell is more appropriately

attributed to the natural depositional environment of the underlying geologic units. The geologic unit within the testing area, Quaternary marine terrace deposits, is known to preserve shallow-water marine environments and contain beds of mollusk fossils. Therefore, the low-density shell fragments identified in this context likely represent naturally occurring fossil deposits rather than evidence of human activity. Based on the results of the Subsurface Phase 1 Archaeological Investigation, a Phase 2 testing program for P-42-003850/CA-SBA-3850 is not warranted, as the shell fragments identified during testing are likely fossils originating from the underlying geologic units.

Assembly Bill 52 Consultation

The City initiated AB 52 consultation on October 31, 2025, by sending letters via certified mail to the 10 representatives fo the six tribes identified by the NAHC. The City conducted follow up calls on December 9, 2025. Copies of the consultation letters sent to these tribes are included in Appendix E of this EIR.

The Native American tribes that received letters via certified mail included the following:

- Barbareño Band of Chumash Indians
- Barbareño/Ventureño Band of Mission Indians
- Chumash Council of Bakersfield
- Coastal Band of the Chumash Nation
- Northern Chumash Tribal Council
- Santa Ynez Band of Chumash Indians

A Project description and map were included in the letters, which stated that tribal contacts had 30 days from receipt of the letter to request, in writing, formal consultation under AB 52. The following summarizes the results of Native American consultation under AB 52.

On November 21, 2025, Cultural Resources Archaeologist Amanda Dobrov responded on behalf of the Elder's Council for the Santa Ynez Band of Chumash Indians. Ms. Dobrov stated that the Tribe is interested in consulting on the Project. She further inquired if a Phase I Archaeological Resources Report had been prepared and requested a copy of the report for the Tribe's review. On November 24, 2025, City of Santa Barbara Project Planner Kaitlin Mamulski responded to Ms. Dobrov and stated that an HPIR is in progress and the City will share it with the Tribe once it has been completed. The City provided a copy of previously prepared Cultural Resources Conditions Report for the Tribe's review and inquired if the Tribe would like to set up an AB 52 consultation meeting with the City. On December 10, 2025, a consultation meeting was held between the City and the Santa Ynez Band of Chumash Indians. The Tribe requested a follow up meeting after receipt of the HPIR and prior to the Draft EIR. On March 24, 2026, the City emailed the Tribe a copy of the HPIR. On March 24, 2026, on a phone call between Ms. Dobrov and City Project Manager Kelly Bourque, Ms. Dobrov indicated agreement with the HPIR recommendations.

On December 9, 2025, Chairperson Matthew Vestuto of the Barbareño/Ventureño Band of Mission Indians responded to the City's follow up call and stated that the Tribe defers recommendations to the Barbareño Band of Chumash Indians for projects located within the city of Santa Barbara.

On December 9, 2025, Chairperson Gabe Frausto of the Coastal Band of the Chumash Nation responded to the City's follow up call and requested the AB 52 notification letter be sent to his email address. That same day, the City emailed the AB 52 notification letter to Chairperson Frausto at the email address provided.

On January 28, 2026, Chairperson Eleanor Fishburn of the Barbareño Band of Chumash Indians responded to the City via email and inquired if there were any site records for the Project. On January 29, 2026, the City responded by providing the 2023 Cultural Resources Conditions Report prepared for the Project and stated that the Historic Properties Identification Report was still in progress and would be shared with the Tribe once completed. The City inquired if Chairperson Fishburn would like to request a meeting to discuss the Project further. As of the date of this Draft EIR, a response from the Barbareño Band of Chumash Indians has not been received.

As of the date of this Draft EIR, consultation with the Santa Ynez Band of Chumash Indians is considered concluded.

No additional requests for consultation have been received and no TCRs have been identified by the Project's consulting tribes.

b. Project Impacts and Mitigation Measures

Threshold 2:	Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

Impact CUL-1 CONSTRUCTION OF THE PROJECT HAS THE POTENTIAL TO SIGNIFICANTLY IMPACT PREVIOUSLY RECORDED AND UNKNOWN ARCHAEOLOGICAL RESOURCES. FOLLOWING IMPLEMENTATION OF MITIGATION MEASURES CUL-1 THROUGH CUL-3, IMPACTS WOULD BE LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED.

As described in Section 4.2.3 *Methodology*, the 2026 HPIR identified one previously recorded archaeological resource (P-42-003850/CA-SBA-3850) adjacent to the Project site. The archaeological survey resulted in the identification of very low-density shell fragments (n=5) within disturbed soils within the Project site. It is likely the shell fragments (n=2) identified within the Vic Trace Reservoir parcel were imported with the fill material and gravel used to construct the reservoir, the communications facility, and access roads. Further, it is likely the small shell fragments (n=3) identified along the southern road shoulder of Dolores Drive have either been transported via erosion or redeposited.

Given the cultural resources sensitivity of the area and that a portion of the Project site is located adjacent to a previously recorded archaeological resource, Project-related ground disturbances have the potential to impact P-42-003850/CA-SBA-3850. Therefore, a Subsurface Phase 1 Investigation was conducted to determine if subsurface archaeological deposits associated with P-42-003850/CA-SBA-3850 are present within the Project site. The Vic Trace Outlet Main corridor and Dolores Drive Main corridor were not subject to the Subsurface Phase 1 Investigation due to the corridors being within a paved, well-used roadway. The Subsurface Phase 1 Archaeological Investigation resulted in the identification of 11 marine shell fragments and one historic-period square cut nail within previously disturbed soils . Isolated artifacts are typically ineligible for the NRHP and CRHR as their data potential is exhausted during initial recordation.

Based on the results of the field survey and Subsurface Phase 1 Archaeological Investigation, there is no clear indication the shell fragments are cultural in nature, and a Phase 2 testing program for P-42-003850/CA-SBA-3850 was not warranted. However, given the proximity of the Project site to resource P-42-003850/CA-SBA-3850, there remains the potential for subsurface archaeological materials to be unearthed during construction near the intersection of Meigs Road and Dolores Drive. Therefore, ground-disturbing activities associated with the Project have the potential to

impact previously recorded and unknown archaeological resources that may be present on or below the ground surface. Such impacts would constitute a significant impact under CEQA.

Implementation of Mitigation Measures CUL-1, CUL-2, and CUL-3 would reduce impacts to a less-than-significant level.

Mitigation Measures

CUL-1 Worker's Environmental Awareness Program (WEAP)

A City Qualified Archaeologist and local Chumash Tribal Representative shall be retained to provide a Workers Environmental Awareness Program (WEAP) to Project construction personnel, including field consultants and construction workers, prior to the commencement of ground disturbing activities. Chumash tribal representative should assist in preparation of the WEAP. The WEAP shall include:

- Applicable regulations including the requirement for confidentiality and consequences of violating state laws and regulations.
- Protocols for avoidance and appropriate measures for avoiding and minimizing impacts resources that could be present.
- Culturally appropriate treatment of any discovery of significance to Native Americans, including appropriate behaviors and responsive actions to follow, consistent with Native American tribal values.
- Relevant information outlining what to do and who to contact if any potential cultural resources or tribal cultural resources are encountered.

All Project construction personnel shall attend the WEAP prior to performing any work. Copies of the training attendance sheets shall be provided to City staff as a record of compliance. As new construction personnel associated with ground disturbing activities are added during Project construction, they shall be required to review the WEAP and sign off with acknowledgement from the construction contractor, who shall inform the monitoring archaeologist and local Chumash tribal representative observer.

CUL-2 Archaeological and Native American Monitoring at Meigs Road and Dolores Drive Intersection

Prior to the start of construction, a City Qualified Archaeologist and a local Chumash tribal representative (e.g., Barbareño Band of Chumash Indians, Santa Ynez Band of Mission Indians, Coastal Band of the Chumash Nation) shall be retained to oversee monitoring during Project-related ground disturbing activities within 150 feet of the intersection of Meigs Road and Dolores Drive.

- If archaeological resources are encountered or suspected, work shall be halted or redirected immediately and the City Environmental Analyst shall be notified. The City Qualified Archaeologist shall assess the nature, extent and significance of any discoveries and develop appropriate management recommendations for archaeological resource treatment which may include, but are not limited to, redirection of grading and/or excavation activities, consultation and/or monitoring with a local Chumash tribal representative.
- If a discovery consists of possible human remains, the Santa Barbara County Coroner shall be contacted immediately pursuant to Health and Safety Code Sections 7050.5 and Public Resources Code Sections 5097.94, 5097.98, and 5097.99. If the Coroner determines that the

remains are Native American, the Coroner shall contact the California Native American Heritage Commission to identify the Most Likely Descendant, who shall work with the City to determine the appropriate disposition of the remains in a location that ensures their preservation in perpetuity. A local Chumash tribal representative shall be retained to monitor all further subsurface disturbance in the area of the find. Work in the area may only proceed after the City Environmental Analyst grants authorization.

- If a discovery consists of possible prehistoric or Native American materials or artifacts, a local Chumash tribal representative shall be retained to monitor all further subsurface disturbance in the area of the find. Work in the area may only proceed after the Environmental Analyst grants authorization.
- If unknown tribal cultural resources (TCRs) are encountered or suspected, work shall be halted or redirected immediately and the City Environmental Analyst shall be notified. The local Chumash tribal representative monitor (and City Qualified Archaeologist if archaeological resources are identified) shall assess the nature, extent and significance of any discoveries and develop appropriate management recommendations for TCR and archaeological resource treatment. This may require additional consultation with other Chumash tribal representatives. Resulting management recommendations may include, but are not limited to, archaeological investigations to determine the spatial extent and characteristics of the resources within the Project area, possible alternative designs, sites, or construction methods to avoid the resource, and/or continued monitoring by the local Chumash tribal representative and archaeologist.

Archaeological Resources Construction Monitoring Report:

A final report on the results of the archaeological and TCR monitoring shall be submitted to the City Environmental Analyst within 180 days of completion of the steps outlined above.

CUL-3 Unanticipated Discovery of Archaeological and Tribal Cultural Resources

Prior to the start of construction, including any vegetation or paving removal, demolition, trenching or grading, contractors and construction personnel shall be alerted to the possibility of uncovering unanticipated subsurface archaeological features or artifacts associated with past human occupation.

If such archaeological or tribal cultural resources are encountered or suspected, work shall be halted immediately. The City Environmental Analyst shall be notified, and a City Qualified Archaeologist shall be retained by the applicant to assess the nature, extent, and significance of the discovery. The City Qualified Archaeologist shall develop appropriate management recommendations for the treatment of archaeological resources, which may include, but are not limited to, redirection of grading and/or excavation activities, and consultation and/or monitoring with a local Chumash representative. The City Environmental Analyst shall determine when work shall proceed.

If a discovery consists of possible human remains, or possible prehistoric or Native American artifacts or materials, the procedures identified in 7.1.2 Archaeological and Native American Monitoring at Meigs Road and Dolores Drive Intersection above shall be implemented.

Significance After Mitigation

Mitigation Measures CUL-1 and CUL-2 would reduce impacts to previously recorded archaeological resource P-42-003850/CA-SBA-3850 located adjacent to the Project site to a less than significant level by requiring a WEAP for all personnel involved in Project construction to reduce inadvertent

damage to the resource (Mitigation Measure CUL-1) and archaeological and Native American monitoring during Project-related ground disturbing activities within 150 feet of the intersection of Meigs Road and Dolores Drive to increase the probability of early cultural resources detection and in-field avoidance (Mitigation Measure CUL-2). Mitigation Measure CUL-3 identifies procedures to be followed in the event of an unanticipated discovery during Project construction and provides a significance evaluation pathway and treatment of unanticipated discoveries, consistent with *CEQA Guidelines* and the City's MEA. With implementation of Mitigation Measures CUL-1 through CUL-3, potential impacts to previously unknown archaeological resources and TCRs during project construction would be reduced to a less than significant level.

Threshold 4:	Would the project cause a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code Section 21074 that is listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k)? Would the project cause a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code Section 21074 that is a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1?

Impact TCR-1 NO KNOWN TCRS HAVE BEEN IDENTIFIED WITHIN THE PROJECT SITE. THE PROPOSED PROJECT MAY CAUSE A SUBSTANTIAL ADVERSE CHANGE IN THE SIGNIFICANCE OF A PREVIOUSLY UNKNOWN OR UNIDENTIFIED TCR DUE TO PROJECT CONSTRUCTION ACTIVITIES. FOLLOWING IMPLEMENTATION OF MITIGATION MEASURES CUL-1 AND CUL-3, IMPACTS WOULD BE LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED.

The presence and significance of a potential TCR is determined through consultation between lead agencies and local California Native American tribes. Impacts to TCRs are highly dependent on the nature of the resource but, in general, could occur if there is destruction or alteration of the resource and its surroundings, restricted access to the resource, or other disturbances.

As of the date of this EIR, no TCRs have been identified within the Project site during the background research or AB 52 consultation process. However, given the general archaeological sensitivity of the area, Project-related ground-disturbing activities have the potential to encounter previously undiscovered cultural resources of Native American origin that could later be determined as TCRs upon evaluation. As a result, impacts to such resources during construction may be potentially significant. Implementation of Mitigation Measures CUL-1 and CUL-3 would reduce impacts to a less-than-significant level.

Upon completion of construction activities, ground disturbing activities would cease, and Project operation would not result in impacts to TCRs.

Mitigation Measures

Potential impacts to TCRs are addressed by Mitigation Measure CUL-1 which requires a WEAP and Mitigation Measure CUL-3 which identifies procedures to be implemented in the event of an unanticipated discovery of TCRs.

Significance After Mitigation

With implementation of Mitigation Measures CUL-1 and CUL-3, potential impacts to previously unknown archaeological and TCRs during project construction would be reduced to a less than significant level. Mitigation Measures CUL-1 and CUL-3 require a WEAP for personnel involved in Project construction and an unanticipated discovery measure which identifies procedures to be followed in the event of an unanticipated discovery during Project construction.

4.4.4 Cumulative Impacts

A project's environmental impacts are "cumulatively considerable" if the "incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects" (*CEQA Guidelines* Section 15065[a][3]). The geographic scope for cumulative impacts related to archaeological resources is the Project site and adjacent properties within the Alta Mesa neighborhood. This geographic scope is appropriate because, generally, cultural resources impacts associated with individual developments are site-specific in nature and must be addressed on a case-by-case basis. TCRs have the potential to extend across project sites; therefore, the appropriate geographic scope for cumulative TCR impacts includes development projects adjacent to the Project site, as well as within the surrounding region.

Projects listed in Table 3-1 in Chapter 3, *Environmental Setting*, were considered during the analysis of cumulative impacts to archaeological resources and TCRs. The Project, in conjunction with other nearby past, present, and reasonably foreseeable future projects in the region, may have the potential to adversely impact archaeological resources and TCRs through ground disturbing construction activities. The magnitude of impacts for individual projects would depend upon the location, size of development, depth of the ground disturbance, and the resources associated with or location within the individual development sites. Cumulative projects increase the potential for impacts to buried archaeological resources and TCRs through construction activities in the area. However, as with the proposed Project, future projects would be subject to site-specific mitigation measures and existing regulations intended to protect archaeological resources and TCRs. Therefore, cumulative development would have a less-than-significant cumulative impact involving substantial adverse changes in the significance of archaeological resources and TCRs.

This page intentionally left blank.

4.5 Geology and Soils

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to geology and soils would be significant if the proposed Project would:

1. Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:
   a. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault.
   b. Strong seismic ground shaking.
   c. Seismic-related ground failure, including liquefaction.
   d. Landslides.
2. Result in substantial soil erosion or the loss of topsoil.
3. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse.
4. Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property.
5. Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater.
6. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

The Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 1, 3, 4, and 5 would be less than significant or have no impact. These impacts are discussed in Initial Study Environmental Checklist Section 7, Geology and Soils (Appendix A). Thus, the following discussion solely focuses on Thresholds 2 and 6. The *Paleontological Resources Assessment* used to inform the paleontological resources analysis within this section is included as Appendix F.

4.5.1 Environmental Setting

a. Soils

Project site soils are classified within Hydrologic Soil Groups A, C, and D. Soils in Hydrologic Group A are located underlying the northern half of the Vic Trace Reservoir parcel and beneath La Coronilla Drive and northern Dolores Drive. These soils have low runoff potential when wet and typically have less than 10 percent clay and more than 90 percent sand or gravel and have gravel or sand texture. Soils in Hydrologic Group C are located underlying the southern half of the Vic Trace Reservoir parcel and beneath southern Dolores Drive and Ricardo Avenue. These soils have moderate potential for runoff when wet and typically have between 20 percent and 40 percent clay and less than 50 percent sand and have loam, silt loam, sandy clay loam, clay loam, and silty clay loam textures. Soils in Hydrologic Group D are located under small portions of Meigs Road and Dolores

Drive, have high runoff potential when wet, and typically have greater than 40 percent clay, less than 50 percent sand, and clayey textures.[1,2]

The soil erodibility factor, or K-factor, is a measure of the susceptibility of soil particles to detach and transport by rainfall and runoff. K-factors range from 0.02 to 0.69, and other factors being equal, the higher the value, the more susceptible the soil is to sheet and rill erosion by surface water flows.[2] Soil erodibility and the associated K-factor ranges are presented below in Table 4.5-1.

Table 4.5-1 Soil Erodibility and K-Factor Ranges

K-Factor Range	Soil Erodibility[3]
0.05 – 0.15	Low
0.15 – 0.4	Moderate
0.4 – 0.69	High

Project site soils, their Hydrologic Groups, and their K-factor ratings are shown in Table 4.5-2. As shown therein, Project site soils have K-factor ratings ranging from 0.15 to 0.43, indicating a range of low to moderate soil erosion potential.

Table 4.5-2 K-Factor Ratings of Project Site Soils

Soil Unit and Hydrologic Group	K-Factor[2]
Arnold loamy sand, 15 to 30 percent slopes, eroded, MLRA 20 Hydrologic Group A	0.15
Ayar clay, 15 to 30 percent slopes Hydrologic Group C	0.20
Ayar clay, 50 to 75 percent slopes Hydrologic Group C	0.20
Concepcion fine sandy loam, 2 to 9 percent slopes Hydrologic Group D	0.20

b. Paleontological Resources

Paleontological resources, or fossils, are the evidence of once-living organisms preserved in the rock record. They include both the fossilized remains of ancient plants and animals and the traces thereof (e.g., trackways, imprints, burrows, etc.). Paleontological resources occur within bedrock geologic deposits that underly the soil layer and are almost exclusively preserved in sedimentary rocks; however, in rare cases, fossils can also be preserved in volcanic rocks and low-grade metamorphic rocks under certain conditions. The Society of Vertebrate Paleontology (SVP) has defined fossils as being remains or traces of plants and animals that are greater than 11,700 years old (i.e., Pleistocene or older).[4] Fossils occur in a non-continuous and often unpredictable distribution within some sedimentary units, and the potential for fossils to occur within sedimentary units depends on several factors.

The Project site is situated in the Transverse Ranges geomorphic province, one of the eleven geomorphic provinces in California.[5] The Transverse Ranges extend approximately 275 miles west-east from Point Arguello in Santa Barbara County, east to the San Bernardino Mountains, and south to the Anacapa-Santa Monica-Hollywood-Raymond-Cucamonga fault zone.[6] The Transverse Ranges are composed of Proterozoic to Mesozoic intrusive crystalline igneous and metamorphic rocks overlain by Cenozoic marine and terrestrial sedimentary deposits and volcanic rock.[7] Locally, the Project site is within the *Santa Barbara, California* United States Geological Survey 7.5-minute quadrangle.

The paleontological sensitivity of the geologic units that underlie the project site were evaluated to assess the Project's potential for significant impacts to scientifically important paleontological resources. Paleontological sensitivity refers to the potential for a geologic unit to produce scientifically significant fossils. Direct impacts to paleontological resources occur when earthwork activities, such as grading or trenching, cut into the geologic deposits within which fossils are buried and physically destroy the fossils. Sensitivity is determined by rock type, history of the geologic unit in producing significant fossils, and fossil localities recorded from that unit. Paleontological sensitivity is derived from the known fossil data collected from the entire geologic unit, not just from a specific survey.

In the absence of other sensitivity criteria required by certain federal, State, or local regulatory agencies, the SVP's Fossil Prediction Map System (FPMS) is used to assign paleontological sensitivity to geologic units.[8] FPMS assignments are based on rock units within which vertebrate or significant invertebrate fossils have been determined by previous studies to be present or likely to be present. Fossil occurrences are correlated with the geologic units that contain them, therefore the history of a geologic unit in producing fossils can be used to predict its potential for producing fossils in the future. The FPMS is a 5-tier scale ranging from FPMS 1 (Very Low Potential) to FPMS 5 (Very High Potential) geologic units along with other rankings for geologic units with unknown potential or areas covered by water or ice. Following the literature review, a paleontological sensitivity classification was assigned to each geologic unit mapped within the Project site. This criterion is based on rock units within which vertebrate or significant invertebrate fossils have been determined by previous studies to be present or likely to be present. The potential for impacts to significant paleontological resources is based on the potential for ground disturbance to directly impact paleontologically sensitive geologic units.

The geology of the region around the Project site was mapped by Minor et al.,[9] who identified three geologic units underlying the site: Quaternary marine terrace deposits, Santa Barbara Formation, and Monterey Formation, all of which have FPMS 4 (High) paleontological sensitivity (Figure 4.5-1). The geotechnical investigation, performed by Earth Systems, also reported up to 14.5 feet of artificial fill in the Vic Trace Reservoir parcel.[10]

[10] Earth Systems Southern California (Earth Systems). 2013. Engineering Geology and Geotechnical Engineering Report for the Vic Trace Reservoir, La Coronilla Drive, Santa Barbara, California. No.: VT-24831-01. December 9, 2013.

Artificial Fill

Artificial fill is not mapped in the Project site by Minor et al.[11], but it was noted during the geotechnical investigation. Earth Systems stated that this artificial fill was likely placed during original reservoir construction with the greatest thickness, up to 14.5 feet, under the southwestern side of the existing reservoir.[12] This artificial fill consists of silty sand. The distribution of artificial fill throughout this parcel is likely non-continuous and, therefore, difficult to predict. Artificial fill represents sediment removed from its original stratigraphic context; therefore, it has FPMS 1 (Very Low) paleontological sensitivity.

Quaternary Marine Terrace Deposits

Quaternary marine terrace deposits are mapped in several places within the Project site (Figure 4.5-1). Quaternary marine terrace deposits consist of tan, brown, or gray; weakly to moderately consolidated; weakly to moderately bedded; gravel, sandstone, or siltstone.[13] This geologic unit is late Pleistocene in age and represents sediments deposited in near-shore marine environments. Quaternary marine terrace deposits are known to preserve paleontological resources, including in southern Santa Barbara County,[14] producing eared seal (*Arctocephalus*), sea otter (*Enhydra*), mastodon (*Mammut*), mammoth (*Mammuthus*), cormorant (*Phalacocorax*), and invertebrate fossils. Given this fossil-producing history, Quaternary marine terrace deposits have FPMS 4 (High) paleontological sensitivity.

Santa Barbara Formation

The Santa Barbara Formation underlies the majority of the Project site (Figure 4.5-1). The Santa Barbara Formation is described by Minor et al. as consisting of pale-gray, buff, or pale yellow friable, massively bedded to laminated, sandstone and pebbly sandstone[15], and the strata of the Santa Barbara Formation encountered by Earth Systems consisted of massive or crudely bedded silt and sand.[14] The Santa Barbara Formation is Pleistocene in age, and has produced numerous paleontological resources, including cormorant (*Phalacocorax*) and invertebrates.[16] Given this fossil-producing history, Santa Barbara Formation has FPMS 4 (High) paleontological sensitivity.

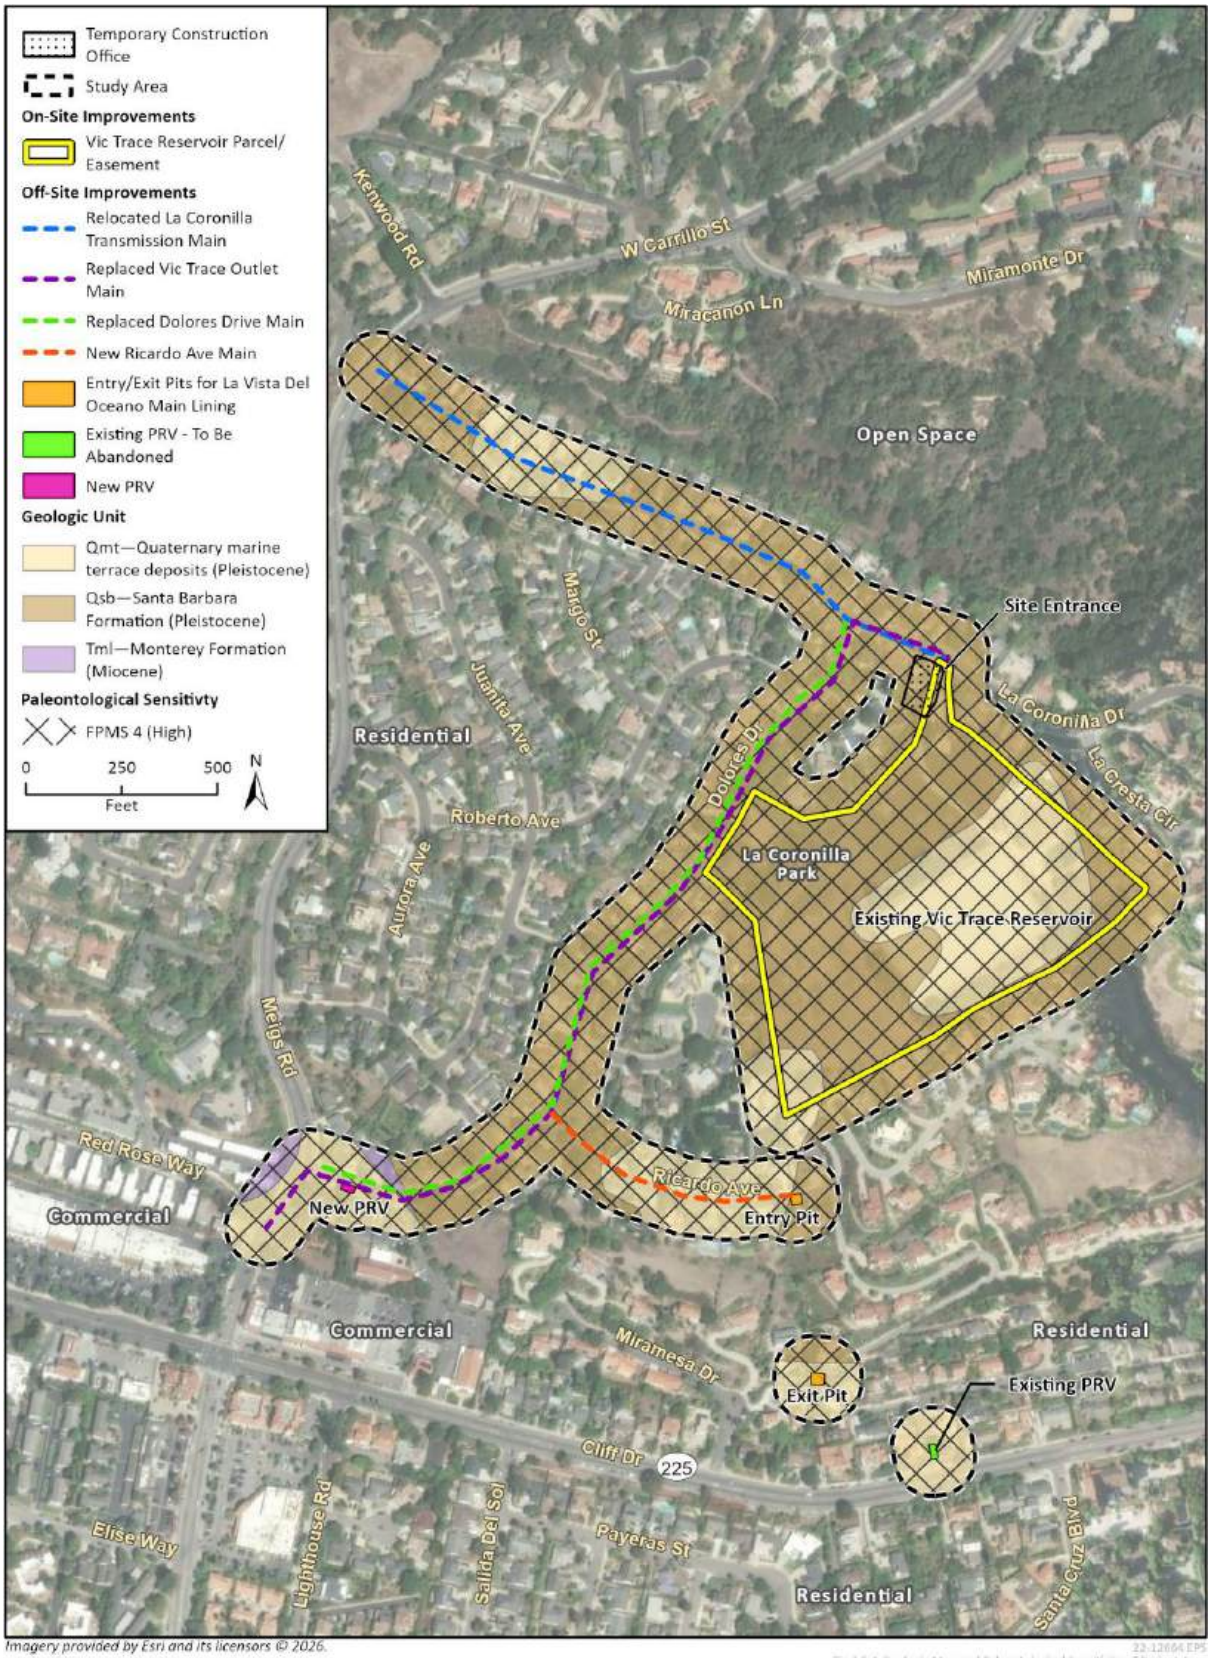
Figure 4.5-1 Paleontological Sensitivity of Geologic Units Underlying Project Site



Imagery provided by Esri and its licensors © 2026.
Geologic data provided by Minor et al. 2009.

Monterey Formation

Small portions of the Project site are mapped as Monterey Formation (Figure 4.5-1). Specifically, Minor et al. identified these strata as the 'lower calcareous unit', which consists of brown weathering to white or tan, well-bedded, siliceous mudstone or shale with minor amounts of dolomite, breccia, and sandstone.[17] The Monterey Formation has produced numerous paleontological resources in Santa Barbara County including marine mammal (*Paleoparadoxia*), sea bird (*Osteodontornis*, *Phalacocorax*), shark (*Elasmobranchii*), ray-finned fish (*Actinopterygii*), and invertebrate fossils.[18] Given this fossil-producing history, the Monterey Formation has high paleontological sensitivity.

4.5.2 Regulatory Setting

a. Federal Regulations

Clean Water Act

Congress enacted the Clean Water Act (CWA), formerly the Federal Water Pollution Control Act of 1972, with the intent of restoring and maintaining the chemical, physical, and biological integrity of the waters of the United States. The CWA requires states to set standards to protect, maintain, and restore water quality through the regulation of point source and non-point source discharges to surface water. Those discharges are regulated by the National Pollutant Discharge Elimination System (NPDES) permit process (CWA Section 402). NPDES permitting authority is administered by the California State Water Resources Control Board (SWRCB) and its nine Regional Water Quality Control Boards (RWQCB) on behalf of the United States Environmental Protection Agency. The city of Santa Barbara is within the jurisdiction of the Central Coast RWQCB.

While the CWA is primarily associated with protecting and enhancing surface water quality, some regulatory provisions of the CWA help to control erosion and soil loss and compliance with these provisions can help mitigate potential impacts to geology and soils. In particular, the SWRCB administers the NPDES Construction General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Construction Stormwater General Permit) (Order No. 2022-0057-DWQ, NPDES No. CAS000002). The order applies to construction sites or other projects that include one or more acres of soil disturbance, as required by the CWA. Activities subject to the Construction Stormwater General Permit include clearing, grading, and disturbances to the ground, such as grubbing or excavation. The Construction Stormwater General Permit requires the development and implementation of a Stormwater Pollution Prevention Plan (SWPPP) prepared by a Qualified SWPPP Developer and submitted to the SWRCB. The SWPPP contains a site map that shows the construction site perimeter, existing and proposed buildings, lots, roadways, stormwater collection and discharge points, general topography both before and after construction, and drainage patterns across the project site. The purposes of the SWPPP are: (1) to help identify the sources of sediment and other pollutants that could affect the quality of stormwater discharges and (2) to describe and ensure the implementation of best management practices (BMPs) to reduce or eliminate sediment and other pollutants in stormwater as well as non-stormwater discharges resulting from construction activity. BMPs that can be implemented include, but are not limited to,

[17] Minor, S.A., K.S. Kellogg, R.G. Stanley L.D. Gurrola, E.A. Keller, and T.R. Brandt. 2009. Geologic map of the Santa Barbara coastal plain area, Santa Barbara County, California. [map.] United States Geological Survey. Scientific Investigations Map SIM-3001, scale 1:25,000
[18] University of California Museum of Paleontology. 2025. UCMP online database specimen search portal, http://ucmpdb.berkeley.edu/ (accessed August 2025).

silt fences, runoff control devices, wind erosion control, prevention of fluid leaks, and use of tracking controls at the site entrance.

b. State Regulations

California Public Resources Code Section 5097.5

California Public Resource Code (PRC) Section 5097.5 states "no person shall knowingly and willfully excavate upon, or remove, destroy, injure or deface" any "vertebrate paleontological site" on public lands without the "permission of the public agency having jurisdiction over such lands." Violation of this section is a misdemeanor. As used in PRC Section 5097.5, "public lands" means lands owned by or under the jurisdiction of the State or any city, county, district, authority, or public corporation, or any agency thereof. Consequently, public agencies are required to comply with PRC Section 5097.5 for their own activities, including construction and maintenance, as well as for permit actions (e.g., encroachment permits) undertaken by others.

c. Local Regulations

Post-Construction Stormwater Management Requirements

The Central Coast RWQCB adopted the Post-Construction Stormwater Management Requirements for *Development Projects in the Central Coast Region* (Post-Construction Requirements; Resolution R3- 2013-0032) in July 2013, which outlines runoff reduction and treatment requirements for development projects during operation. These requirements include those designed to minimize erosion during operation.

City of Santa Barbara Storm Water Best Management Practice Guidance Manual

The City of Santa Barbara's Storm Water BMP Guidance Manual provides locally applicable standards and design practices intended to reduce erosion, retain sediment on-site, and protect downstream water quality during and after development. The manual outlines a suite of structural and non-structural BMPs to minimize soil disturbance and promote infiltration rather than runoff. It details requirements for evaluating site conditions, conducting soil and infiltration testing, and selecting appropriate BMPs based on slopes, pollutant sources, and hydrologic constraints, forming a regulatory framework that supports compliance with post-construction stormwater regulations and aids in preventing erosion-related impacts.[19]

City of Santa Barbara Municipal Code

Chapter 22.12 of the City of Santa Barbara Municipal Code addresses the preservation and protection of paleontological resources in the city of Santa Barbara.

Section 22.12.020A states that grading permits granted for areas of known or probable paleontological (or archaeological) significance shall ensure that the grading activities are designed so as to:

[19] City of Santa Barbara. 2020. Storm Water BMP Guidance Manual. https://sbparksandrec.santabarbaraca.gov/sites/default/files/documents/Parks%20%26%20Recreation/Creeks/Final%20Guidance%20Manual.pdf (accessed February 2026).

- Ensure the preservation or avoidance of the site, if feasible; or
- Minimize adverse impacts on the site; or
- Allow reasonable time for qualified professionals to perform archaeological or paleontological investigations at the site; or
- Preserve for posterity, in such other manner as may be necessary or appropriate in the public interest, the positive aspects of the archaeological or paleontological site involved.

Section 22.85 establishes the City's core regulatory framework for controlling erosion and sedimentation during grading and construction activities by requiring that any grading subject to a permit under the California Building Code obtain a City grading or building permit (Section 22.85.010) and submit a City-approved erosion and sedimentation control plan consistent with the City's adopted Erosion and Sedimentation Control Program (Section 22.85.020). Once approved, the ordinance mandates installation (Section 22.85.030) and ongoing maintenance (Section 22.85.040) of all required erosion and sedimentation control measures for the duration of site disturbance, with compliance verified through final inspection.

4.5.3 Impact Analysis

a. Significance Criteria and Methodology

Significance Criteria

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to geology and soils would be significant if the proposed Project would:

2. Result in substantial soil erosion or the loss of topsoil.
6. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

As mentioned above, the Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 1, 3, 4, and 5 would be less than significant or have no impact. These impacts are discussed in Initial Study Environmental Checklist Section 7, Geology and Soils (Appendix A). Thus, the following discussion solely focuses on Thresholds 2 and 6.

Methodology

To evaluate the potential impacts of the proposed Project related to soil erosion, the proposed Project was analyzed in relation to underlying geology and soils. In determining the level of significance, the analysis assumes the proposed Project would comply with relevant laws, regulations, and guidelines. The analysis is based on review of available documentation, including the *Geotechnical Evaluation for the Vic Trace Reservoir Replacement* (Appendix G), existing City of Santa Barbara General Plan; and the United States Department of Agriculture Natural Resources Conservation Service Web Soil Survey.

The evaluation of the potential paleontological impacts of the proposed Project was based on review of available documentation, including primary literature and online fossil databases available from the Paleobiology Database, Society of Vertebrate Paleontology and the University of California Museum of Paleontology.

b. Project Impacts and Mitigation Measures

Threshold 2:	Would the project result in substantial soil erosion or the loss of topsoil?

Impact GEO-1 K-FACTOR RATINGS OF PROJECT SITE SOILS INDICATE A RANGE OF LOW TO MODERATE SOIL EROSION POTENTIAL. THE PROPOSED PROJECT WOULD NOT RESULT IN SUBSTANTIAL SOIL EROSION OR THE LOSS OF TOPSOIL. THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

Construction

Soil erosion or the loss of topsoil may occur when soils are disturbed but not secured or restored to the point where wind or rain events may mobilize disturbed soils, resulting in their transport off the Project site. Construction activities involving soil disturbance, such as excavation, stockpiling, and grading could result in increased erosion and sediment transport by stormwater to surface waters. However, Project site soils have K-factor ratings ranging from 0.15 to 0.43, indicating a range of low to moderate soil erosion potential.

Construction activities such as grading, excavation, and tree removal would temporarily disturb soil and increase erosion potential at the Vic Trace Reservoir parcel and off-site improvement areas. Up to 83,000 cubic yards of soil may be exported, primarily from terracing and reservoir excavation.[20] Without controls, disturbed soils could be mobilized by wind or rain and transported off-site.

Construction projects of one or more acres are subject to the requirements of the Construction Stormwater General Permit, which requires preparation and implementation of a SWPPP to control the discharges of pollutants, including sediment, into local surface water drainages. Examples of BMPs that may be implemented during construction include the use of geotextiles and mats, temporary drains and swales, silt fences, and sediments traps. Erosion control practices may include the use of drainage controls such as down drains, detention ponds, filter berms, or infiltration pits; removal of any sediment tracked offsite within the same day that it is tracked; containment of polluted runoff onsite; use of plastic covering to minimize erosion from exposed areas; and restrictions on the washing of construction equipment.

In addition to the Construction Stormwater General Permit requirements, construction activities would be subject to the requirements of Section 22.85 of the City's Municipal Code, which requires preparation of an erosion and sediment control plan in order to obtain a Grading Permit. As stated in Municipal Code Section 22.85.050, the City's Building Official may require additional erosion and sedimentation control measures to be installed or implemented if an inspection of the Project site demonstrates that the erosion and sedimentation control measures shown on the approved erosion and sedimentation control plan are insufficient to prevent sediment or other materials from leaving the site.

Mandatory implementation of the SWPPP and erosion control measures minimize the potential for construction of the Project to cause substantial soil erosion or the loss of topsoil. This impact would be less than significant.

[20] This number represents a conservative estimate and is expected to be substantially reduced through ongoing design efforts.

Operation

During Project operation, storm events could generate runoff capable of mobilizing sediment and contributing to localized erosion on the Vic Trace Reservoir parcel. However, the proposed reservoir replacement and associated improvements would occur on a predominantly pervious 15-acre site, and the Project would not substantially increase impervious surface coverage beyond access road and building footprint improvements as described in Chapter 2, *Project Description*. These minor increases in impervious area would be offset by extensive areas of restored pervious surfaces, including vegetated slopes, pervious terrace surfacing, and swales, all designed to slow, infiltrate, and control stormwater consistent with the City's Storm Water Best Management Practice Guidance Manual. Much of the onsite Project area would remain in native or drought-tolerant landscaping, reducing the potential for soil saturation and irrigation-related erosion. In addition, the Project's new stormwater storage area, vegetated swales, and on-site drainage network would manage stormwater flows so that runoff rates under post-project conditions would not substantially exceed existing conditions.

The Project would implement permanent low-impact development features that detain, retain, and filter stormwater, consistent with Central Coast RWQCB Post-Construction Stormwater Management Requirements and the City's Storm Water Best Management Practice Guidance Manual. Proposed low-impact development BMPs would include on-site storage areas, infiltration-supportive grading, and vegetated swales, and would reduce runoff volume, decrease erosive velocities, and limit off-site sediment transport. The Project would continue to direct runoff toward stabilized pervious areas wherever feasible.

With implementation of low-impact development BMPs designed to minimize soil erosion, construction of the proposed Project would have little potential to cause substantial soil erosion or the loss of topsoil. This impact would be less than significant.

Mitigation Measures

No mitigation is required.

Threshold 6:	Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Impact GEO-2 THE PROJECT WOULD INVOLVE EXCAVATION INTO SOILS WITH HIGH PALEONTOLOGICAL SENSITIVITY, WHICH COULD SIGNIFICANTLY IMPACT PALEONTOLOGICAL RESOURCES. FOLLOWING IMPLEMENTATION OF MITIGATION MEASURES GEO-1 AND GEO-2, PROJECT IMPACTS WOULD BE LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED.

Significant impacts to paleontological resources include the destruction, damage, or loss of scientifically important paleontological resources or associated stratigraphic data. Ground-disturbing activities (i.e., grading, excavating, trenching) in undisturbed sediments or geologic units with high or undetermined paleontological sensitivity have the potential to significantly impact paleontological resources under the California Environmental Quality Act (CEQA). The Project site is underlain by four geologic units, of which Quaternary marine terrace deposits, Santa Barbara Formation, and Monterey Formation, have FPMS 4 (High) paleontological sensitivity. The fourth, artificial fill, has FPMS 1 (Very Low) paleontological sensitivity.

A paleontological records search of the SBMNH recovered no known fossil localities within the Project site.[21] However, SBMNH does contain five localities within 5 miles of the Project site. The closest of these localities included two Pacific mastodon (*Mammut pacificus*) specimens recovered approximately 0.8 mile northwest of the Project site.

Ground-disturbing activities for the Project are anticipated to affect previously undisturbed, high-sensitivity sediments, and therefore, have the potential to significantly impact paleontological resources.

Mitigation Measures GEO-1 and GEO-2 would reduce impacts to a less-than significant level.

Mitigation Measures

GEO-1 Paleontological Resources Monitoring and Mitigation Plan

Prior to start of construction, the City shall retain a Paleontologist meeting the standards for a Paleontological Principal Investigator, as defined by the Society of Vertebrate Paleontology (SVP 2025). The Paleontologist shall draft a Paleontological Resources Mitigation and Monitoring Plan, which shall direct all mitigation measures related to paleontological resources and be sent to the City Environmental Analyst or designee for their review and approval. The Paleontological Resource Mitigation Plan shall include the following:

- Paleontological Monitoring - Monitoring is to be conducted during ground-disturbing construction activities within previously undisturbed sediments assigned high paleontological sensitivity as identified and determined by the Paleontologist. Activities that will exclusively impact artificial fill and/or disturbed sediments will not require paleontological monitoring. Paleontological monitoring shall be conducted by a paleontological monitor with experience with collection and salvage of paleontological resources and who meets the minimum standards of the SVP (2025) for a Paleontological Resources Monitor. The Paleontologist may recommend that monitoring be reduced in frequency or ceased entirely based on geologic observations.
- Fossil Discovery - In the event of a fossil discovery by the Paleontologist, paleontological monitor or construction personnel, all construction activity within 50 feet of the find shall cease. The Paleontologist shall evaluate the find. If the Paleontologist determines the fossil(s) is (are) not scientifically significant, then construction activity may resume. If the Paleontologist determines the fossils may be scientifically significant, the following shall occur:
  - Fossil Salvage - The fossil shall be salvaged (excavated and collected) to protect it from damage/destruction. Typically, fossils can be safely salvaged quickly by a single paleontological monitor with minimal disruption to construction. In some cases, larger fossils (such as complete skeletons or large mammal fossils) require more extensive salvage operations. After fossil salvage is complete, construction activity may resume.
  - Fossil Preparation and Curation - Fossils shall be identified to the lowest (most-specific) possible taxonomic level, prepared to a curation-ready condition, and curated in a fossil repository per SVP (2025) standards, such as the Santa Barbara Museum of Natural History, along with all pertinent data, photos, and/or maps required by the repository.

[21] Santa Barbara Museum of Natural History (SBMNH). 2025. Santa Barbara Museum of Natural History Earth Science Collection: Search Results of Paleontological Specimens from Santa Barbara County Near the Vic Trace Reservoir Replacement Project (22-12664). Prepared by Jonathan M. Hoffman. July 28, 2025.

- Final Paleontological Mitigation Report - Upon completion of ground-disturbing activities (or preparation and curation of fossils, if necessary), the Paleontologist shall prepare a final report describing the paleontological mitigation program's results. The report shall include a summary of the field and laboratory methods employed; an overview of Project geology; and, if applicable, an analysis of the recovered fossils. The report shall be submitted to the City and, if fossil curation occurred, the designated fossil repository.

GEO-2 Worker Environmental Awareness Program

Prior to the start of construction, the Paleontologist or their designee shall conduct a paleontological Worker Environmental Awareness Program (WEAP) training for Project construction personnel regarding the appearance of fossils and the procedures for notifying paleontological staff should fossils be discovered. Project construction personnel shall sign a form provided by the trainer documenting they have attended the WEAP and understand the information presented to them. The construction contractor shall be responsible for ensuring personnel adhere to the guidelines and restrictions designed to avoid impacts to paleontological resources. If new construction personnel associated with ground disturbing activities are added to the Project, the contractor shall confirm the new personnel receive the WEAP training before starting work. The subsequent training of personnel can include a video recording of the initial training and/or the use of written materials rather than in-person training by the Paleontologist.

Significance After Mitigation

Impacts related to paleontological resources would be reduced to a less than significant level with implementation of Mitigation Measures GEO-1 and GEO-2. These measures would only apply to ground-disturbing activities in previously undisturbed sediments associated with the construction occurring at the Project site. Implementation of Mitigation Measures GEO-1 and GEO-2 would effectively mitigate the Project's potentially significant impacts to these resources under CEQA through the recovery, identification, and curation of previously unrecovered fossils. Following implementation of Mitigation Measures GEO-1 and GEO-2, the Project's impact to paleontological resources would be less than significant with mitigation incorporated.

4.5.4 Cumulative Impacts

The cumulative impact analysis considers City-wide impacts that would occur from cumulative projects identified in Table 3-1 of Chapter 3, *Environmental Setting*, located in areas subject to erosion potential and on geologic units with paleontological sensitivity. The general approach to cumulative impact analysis used in this EIR is discussed in Chapter 3, *Environmental Setting*.

Cumulative impacts related to soil erosion and the loss of topsoil would be minimized through compliance with the NPDES Construction Stormwater General Permit, which requires the creation and implementation of a SWPPP and corresponding BMPs for projects greater than one acre in size to limit the potential for soil erosion. Furthermore, all projects within the City would be subject to the erosion control measures listed within City of Santa Barbara Municipal Code Section 22.85. Thus, with regulatory compliance, cumulative impacts related to soil erosion and the loss of topsoil would be less than significant.

The potential for impacts to paleontological resources from individual developments is site-specific and depends on the location and extent of ground disturbance associated with each individual development proposal. Areas throughout the region would continue to develop and involve

terracing and excavation activities that would potentially encounter paleontological resources. Therefore, cumulative impacts would be potentially significant. Ground-disturbing activities associated with the proposed Project have the potential to result in the destruction, damage, or loss of undiscovered scientifically important paleontological resources due to the high paleontological sensitivity of the underlying geologic units. However, implementation of Mitigation Measures GEO-1 and GEO-2 would minimize the potential for the proposed Project to cause a substantial adverse change in known or unknown paleontological resources by requiring WEAP training, monitoring, and setting forth procedures for the recovery, identification, and curation of fossils discovered during construction. Therefore, the proposed Project's contribution to cumulative impacts related to paleontological resources or unique geologic features would not be considerable with implementation of mitigation.

This page intentionally left blank.

4.6 Greenhouse Gas Emissions

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to greenhouse gas (GHG) emissions would be significant if the proposed Project would:

1. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
2. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

The Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 1 and 2 would be potentially significant.

4.6.1 Setting

Greenhouse gas emissions and climate change are a cumulative global issue. The United States Environmental Protection Agency (U.S. EPA) and the California Air Resources Board (CARB) regulate GHG emissions within the United States and the State of California, respectively. While CARB has the primary regulatory responsibility within California for GHG emissions, local agencies can also adopt policies for GHG emissions reduction. CARB has divided California into regional air basins. The project is in Santa Barbara County, which is within the South Central Coast Air Basin (SCCAB) and under the jurisdiction of the Santa Barbara County Air Pollution Control District (SBCAPCD).

a. Climate Change and Greenhouse Gases

Climate change is the observed increase in the average temperature of the Earth's atmosphere and oceans along with other substantial changes in climate (such as wind patterns, precipitation, and storms) over an extended period. The term "climate change" is often used interchangeably with the term "global warming," but climate change is preferred because it conveys that other changes are happening in addition to rising temperatures. The baseline against which these changes are measured originates in historical records that identify temperature, rainfall, and other weather conditions, such as during previous ice ages. The global climate is changing continuously, as evidenced in the geologic record, which indicates repeated episodes of substantial warming and cooling. The rate of change has typically been incremental, with warming or cooling trends occurring over the course of thousands of years. The past 10,000 years have been marked by a period of incremental warming, as glaciers have steadily retreated across the globe. However, scientists have observed acceleration in the rate of warming over the past 150 years. The United Nations Intergovernmental Panel on Climate Change (IPCC) expressed that the rise and continued growth of atmospheric carbon dioxide (CO_2) concentrations is unequivocally due to human activities in the IPCC's Sixth Assessment Report.[1] Human influence has warmed the atmosphere, ocean, and land, which has led the climate to warm at an unprecedented acceleration rate in the last 2,000 years. It is estimated that between the period of 1850 through 2019, that a total of 2,390 gigatonnes of anthropogenic (manmade) CO_2 was emitted. It is likely that anthropogenic activities have increased the global surface temperature by approximately 1.07 degrees Celsius (°C) between the years 2010

[1] Intergovernmental Panel on Climate Change (IPCC).2021. Climate Change 2021: The Physical Science Basis. Contribution of Working Group I to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change [Masson-Delmotte, V., P. Zhai, A. Pirani, S. L. Connors, C. Péan, S. Berger, N. Caud, Y. Chen, L. Goldfarb, M. I. Gomis, M. Huang, K. Leitzell, E. Lonnoy, J.B.R. Matthews, T. K. Maycock, T. Waterfield, O. Yelekçi, R. Yu and B. Zhou (eds.)] Cambridge University Press. https://www.ipcc.ch/report/ar6/wg1/ (accessed December 2025).

through 2019.[2] Furthermore, since the late 1700s, estimated concentrations of CO_2, methane, and nitrous oxide in the atmosphere have increased by over 43 percent, 156 percent, and 17 percent, respectively, primarily due to human activity.[3] Emissions resulting from human activities are thereby contributing to an average increase in Earth's temperature.

Gases that absorb and re-emit infrared radiation in the atmosphere are called GHGs. The gases widely seen as the principal contributors to human-induced climate change include carbon dioxide (CO_2), methane (CH_4), nitrous oxides (N_2O), fluorinated gases like hydrofluorocarbons (HFCs) and perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). Water vapor is excluded from the list of GHGs because it is short-lived in the atmosphere, and natural processes like oceanic evaporation, largely determine its atmospheric concentrations.

GHGs are emitted by natural processes and human activities. Of these gases, CO_2 and CH_4 are emitted in the greatest quantities from human activities. Emissions of CO_2 are usually by-products of fossil fuel combustion, and CH_4 results from off-gassing associated with agricultural practices and landfills. Human-made GHGs including fluorinated gases and SF_6, have greater heat-absorption potential than CO_2.[3]

Different types of GHGs have varying global warming potentials (GWP). The GWP of a GHG is the potential of a gas or aerosol to trap heat in the atmosphere over a specified timescale (generally, 100 years). Because GHGs absorb different amounts of heat, a common reference gas (CO_2) is used to relate the amount of heat absorbed to the amount of the gas emitted. This is referred to as "carbon dioxide equivalent" (CO_2e) and is defined as the amount of GHG emitted multiplied by its GWP. Carbon dioxide has a 100-year GWP of one. By contrast, methane has a GWP of 30, meaning its global warming effect is 30 times greater than CO_2 on a molecule per molecule basis.[4]

The accumulation of GHGs in the atmosphere regulates the earth's temperature. Without the natural heat-trapping effect of GHGs, the earth's surface would be about 91 degrees Fahrenheit (°F) cooler.[5]

b. GHG Emissions Inventories

Global Emissions Inventory

In 2015, worldwide anthropogenic GHG emissions totaled 47,000 million metric tons (MMT) of CO_2e, which is a 43 percent increase from 1990 GHG levels. The largest source of GHG emissions were energy production and use (includes fuels used by vehicles and buildings), which accounted for 75 percent of the global GHG emissions.[6]

[2] Intergovernmental Panel on Climate Change (IPCC).2021. Climate Change 2021: The Physical Science Basis. Contribution of Working Group I to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change [Masson-Delmotte, V., P. Zhai, A. Pirani, S. L. Connors, C. Péan, S. Berger, N. Caud, Y. Chen, L. Goldfarb, M. I. Gomis, M. Huang, K. Leitzell, E. Lonnoy, J.B.R. Matthews, T. K. Maycock, T. Waterfield, O. Yelekçi, R. Yu and B. Zhou (eds.)] Cambridge University Press. https://www.ipcc.ch/report/ar6/wg1/ (accessed December 2025).

[3] United States Environmental Protection Agency (USEPA). 2022. Climate Change Indicators: Global Greenhouse Gas Emissions. Last Modified: August 1, 2022. https://www.epa.gov/climate-indicators/climate-change-indicators-global-greenhouse-gas-emissions (accessed December 2025).

[4] The IPCC's (2021) *Sixth Assessment Report* determined that methane has a GWP of 30. However, the 2017 Climate Change Scoping Plan published by the California Air Resources Board uses a GWP of 25 for methane, consistent with the IPCC's (2007) *Fourth Assessment Report*. Therefore, this analysis utilizes a GWP of 25.

[5] World Meteorological Organization. 2022. Greenhouse Gases. https://wmo.int/topics/greenhouse-gases (accessed December 2025).

[6] United States Environmental Protection Agency (USEPA). 2021. Climate Change Indicators: Global Greenhouse Gas Emissions. Last updated April 2021. https://www.epa.gov/climate-indicators/climate-change-indicators-global-greenhouse-gas-emissions (accessed December 2025).

United States Emissions Inventory

United States GHG emissions were 6,341.2 million metric tons (MMT) of CO_2e in 2022 or 5,487 MMT CO_2e after accounting for sequestration. In 2022, the energy sector (including transportation and industrial) accounted for 76.4 percent of nationwide GHG emissions while agriculture, commercial, and residential sections accounted for approximately 23.6 percent of nationwide GHG emissions.[7]

California Emissions Inventory

Based on the CARB California Greenhouse Gas Inventory for 2000-2022, California produced 371.1 MMT of CO_2e in 2022, which is 9.3 MMT of CO_2e lower than 2021 levels. The major source of GHG emissions in California is the transportation sector, which comprises 39 percent of the State of California's total GHG emissions. The industrial sector is the second largest source, comprising 23 percent of the State's GHG emissions while electric power accounts for approximately 16 percent.[8] The annual 2030 statewide target emissions level is 260 MMT of CO_2e.[9]

Local Emissions Inventory

Based on the City of Santa Barbara's 2019 GHG Emissions Inventory, the City generated approximately 622,110 MMT of CO_2e in 2019. On-road transportation was the major source accounting for 44 percent of the total, largely due to passenger vehicles, but also commercial trips and buses. Off-road transportation accounted for 7 percent. Motor vehicle emissions (also measured as Vehicles Miles Traveled [VMT]) is a substantial contributor to GHG emissions in Santa Barbara, due to the large amount of single-occupancy vehicle travel that occurs to, from, and within the city. Residential and nonresidential natural gas usage was the second largest source of emissions at 22 percent. Residential and nonresidential electricity use accounted for 18 percent. Solid waste, water, and wastewater combined accounted for 9 percent of emissions. These calculations are based on fuel sources used for each respective category, including the use of natural gas, petroleum, and electricity. The 2019 inventory does not account for two programs launched following 2019: Santa Barbara Clean Energy, which now offers 100 percent carbon free electricity to City customers, and the Santa Barbara County ReSource Center, which reduces GHG emissions from waste.[10]

c. Potential Effects of Climate Change

Globally, climate change has the potential to affect numerous environmental resources though potential impacts related to future air temperatures and precipitation patterns. Scientific modeling predicts that continued GHG emissions at or above current rates would induce more extreme climate changes during the 21st century than were observed during the 20th century. Each of the past three decades has been warmer than all the previous decades in the instrumental record, and the decade from 2000 through 2010 has been the warmest on record. The average global land and ocean surface temperature for January 2025 was 1.33°C (2.39°F) higher than the 20th century

average of 12.0°C (53.6°F).[11] Furthermore, several independently analyzed data records of global and regional Land-Surface Air Temperature (LSAT) obtained from station observations jointly indicate that LSAT and sea surface temperatures have increased.

According to *California's Fourth Climate Change Assessment*, statewide temperatures from 1986 to 2016 were approximately 0.6 to 1.1°C higher than those recorded from 1901 to 1960. Potential impacts of climate change in California may include reduced water supply from snowpack, sea level rise, more extreme heat days per year, more large wildfires, and more drought years.[12] In addition to statewide projections, *California's Fourth Climate Change Assessment* includes regional reports that summarize climate impacts and adaptation solutions for nine regions of the State and regionally specific climate change case studies.[12] However, while there is growing scientific consensus about the possible effects of climate change at a global and statewide level, current scientific modeling tools are unable to predict what local impacts may occur with a similar degree of accuracy. A summary follows of some of the potential effects that could be experienced in California as a result of climate change.

Air Quality and Wildfires

Scientists project that the annual average maximum daily temperatures in California could rise by 2.4 to 3.2°C in the next 50 years and by 3.1 to 4.9°C in the next century.[12] Higher temperatures are conducive to air pollution formation and could therefore result in worsened air quality in California. As a result, climate change may increase the concentration of ground-level ozone, but the magnitude of the effect and its indirect effects remain uncertain. In addition, as temperatures rise, wildfire burn areas has increased, occurring at even higher elevations in the Sierra Nevada Mountains[12]. If higher temperatures continue to be accompanied by an increase in the incidence and extent of large wildfires, air quality could worsen. Severe heat accompanied by drier conditions and poor air quality could increase the number of heat-related deaths, illnesses, and asthma attacks throughout the State. However, if higher temperatures are accompanied by possible wetter, rather than drier conditions, the rains could tend to temporarily clear the air of particulate pollution, which would effectively reduce the number of large wildfires and thereby ameliorate the pollution associated with them.[13]

Water Supply

Analysis of paleoclimatic data (such as tree-ring reconstructions of stream flow and precipitation) indicates a history of naturally and widely varying hydrologic conditions in California and the West, including a pattern of recurring and extended droughts. Uncertainty remains with respect to the overall impact of climate change on future precipitation trends and water supplies in California. Year-to-year variability in statewide precipitation levels has increased since 1980, meaning that wet and dry precipitation extremes have become more common.[14] This uncertainty regarding future precipitation trends complicates the analysis of future water demand, especially where the relationship between climate change and its potential effect on water demand are not well

[11] National Oceanic and Atmospheric Administration. 2023. Climate Change: Global Sea Level. August 2023. https://www.climate.gov/news-features/understanding-climate/climate-change-global-sea-level. (accessed December 2025).

[13] California Natural Resources Agency. 2021. Draft California Climate Adaptation Strategy. October 2021. https://resources.ca.gov/-/media/CNRA-Website/Files/Initiatives/Climate-Resilience/SAS-Workshops/Draft-CA-Climate-Adaptation-Strategy-ada.pdf (accessed December 2025).
[14] California Department of Water Resources. 2018. Indicators of Climate Change in California. May 2018. https://oehha.ca.gov/media/downloads/climate-change/report/2018caindicatorsreportmay2018.pdf (accessed December 2025).

understood. The average early spring snowpack in the western U.S., including the Sierra Nevada Mountains, decreased by about 10 percent during the last century. During the same period, sea level rose over 0.15 meter along the central and southern California coasts.[12] The Sierra snowpack provides the majority of California's water supply as snow that accumulates during wet winters is released slowly during the dry months of spring and summer. A warmer climate is predicted to reduce the fraction of precipitation that falls as snow and the amount of snowfall at lower elevations, thereby reducing the total snowpack and possible water supplies.[12] Projections indicate that average spring snowpack in the Sierra Nevada and other mountain catchments in central and northern California will decline by approximately 66 percent from its historical average by 2050.[12]

Hydrology and Sea Level Rise

Climate change could affect the intensity and frequency of storms and flooding.[12] Furthermore, climate change could induce substantial sea level rise in the coming century. Rising sea levels increase the likelihood of and risk from coastal flooding. The average rate of increase of global mean sea levels between 1993 to 2025, observed by satellites, is approximately 2.9 millimeters (0.1 inch) per year, nearly double the 20th century trend of 1.6 millimeters (0.06 inch) per year.[15,16] Global mean sea levels in 2013 were about 0.23 meter (0.8 foot) higher than those of 1880.[11] Sea levels are rising faster now than in the previous two millennia, and the rise will probably accelerate, even with robust GHG emission control measures. The most recent IPCC report predicts a mean sea level rise by 2100 ranging between 0.25 to 1.01 meters (0.8 to 3.3 feet), depending on a low, intermediate, or high GHG emissions scenario.[2] A rise in sea levels could erode approximately 31 to 67 percent of southern California beaches and cause flooding of approximately 370 miles of coastal highways during 100-year storm events. Rising sea levels could also jeopardize California's water supply due to saltwater intrusion and induce groundwater flooding and/or exposure of buried infrastructure.[12] Furthermore, increased storm intensity and frequency could affect the ability of flood control facilities, including levees, to handle storm events.

Ecosystems

Climate change and the potential resultant changes in weather patterns could have ecological effects on the global and local scales, including habitat for plants, animals, and people. Soil moisture is likely to decline in many regions as a result of higher temperatures, and intense rainstorms are likely to become more frequent. Rising temperatures could have four major impacts on plants and animals: timing of ecological events; geographic distribution and range of species; species composition and the incidence of nonnative species within communities; and ecosystem processes, such as carbon cycling and storage.[12,17]

4.6.2 Regulatory Setting

There is no overarching federal law specifically related to climate change or the reduction of GHG emissions. In March 2025, the current administration announced the USEPA will undertake 31 actions related to climate change and the reduction of GHG emissions, focusing primarily on reconsidering actions adopted by previous administrations. These include, but are not limited to, reconsideration of regulations on power plants, the Mandatory Reporting Rule, the Endangerment

[15] World Meteorological Organization. 2013. The Global Climate 2001-2010: a decade of climate extremes. July 2013. https://library.wmo.int/records/item/49934-the-global-climate-2001-2010-a-decade-of-climate-extremes (accessed December 2025).
[16] National Aeronautics and Space Administration. 2025. "Sea Level – Earth Indicator." Last modified: September 25, 2025. https://science.nasa.gov/earth/explore/earth-indicators/sea-leve/ (accessed December 2025).
[17] Parmesan, C. August 2006. Ecological and Evolutionary Responses to Recent Climate Change.

Finding, and fuel economy standards, among others. As of the writing of this Draft EIR, none of these regulations have been repealed or replaced with newly adopted regulations. Therefore, these regulations are discussed below.

The United States Supreme Court determined in *Massachusetts et al. v. Environmental Protection Agency et al.* ([2007] 549 US 05-1120) that USEPA has the authority to regulate motor vehicle GHG emissions under the federal Clean Air Act. The USEPA issued a Final Rule for mandatory reporting of GHG emissions in October 2009. This Final Rule applies to fossil fuel suppliers, industrial gas suppliers, direct GHG emitters, and manufacturers of heavy-duty and off-road vehicles and vehicle engines and requires annual reporting of emissions.

In *Utility Air Regulatory Group v. Environmental Protection Agency* (134 Supreme Court 2427 [2014]), the United States Supreme Court held USEPA may not treat GHGs as an air pollutant for purposes of determining whether a source can be considered a major source required to obtain a Prevention of Significant Deterioration or Title V permit. The Court also held that Prevention of Significant Deterioration permits otherwise required based on emissions of other pollutants may continue to require limitations on GHG emissions based on the application of Best Available Control Technology.

a. State Regulations

CARB is responsible for the coordination and oversight of State and local air pollution control programs in California. There are numerous regulations aimed at reducing the State's GHG emissions. These initiatives are summarized below.

California Advanced Clean Cars Program (Assembly Bill 1493)

California's Advanced Clean Cars program (also referred to as "Pavley"), or Assembly Bill (AB) 1493 of 2002, requires CARB to develop and adopt regulations to achieve "the maximum feasible and cost-effective reduction of GHG emissions from motor vehicles." On June 30, 2009, USEPA granted a waiver of Clean Air Act preemption to California for its GHG emission standards for motor vehicles, beginning with the 2009 model year, which allows California to implement more stringent vehicle emission standards than those promulgated by USEPA. Pavley I regulated model years from 2009 to 2016 and Pavley II, now referred to as "Low Emission Vehicle III GHG," regulates model years from 2017 to 2025.

In 2022, CARB approved the Advanced Clean Cars II rule regulating model years from 2026 to 2035. The rule establishes a year-by-year roadmap so that, by 2035, 100 percent of new cars and light trucks sold in California would be zero-emission vehicles, including plug-in hybrid electric vehicles. The regulation realizes and codifies the light-duty vehicle goals set out in Governor Newsom's Executive Order N-79-20. By 2040, CARB anticipates the rule would reduce GHG emissions from light-duty vehicles by 50 percent for a cumulative total of 395 MMT CO_2e from 2026 through 2040. USEPA granted CARB its Clean Air Act waiver request for California on December 18, 2024; however, on June 12, 2025, House Joint Resolution 88 was signed into law, nullifying USEPA's notice that granted CARB's request for the program.

California Advanced Clean Trucks Program

The California Advanced Clean Trucks rule is a CARB regulation that requires medium and heavy-duty truck manufacturers to gradually increase the percentage of zero-emission vehicles they sell in the state. Effective in March 2021, the rule mandates that, by 2035, 55 percent of Class 2b-3 truck

sales, 75 percent of Class 4-8 straight truck sales, and 40 percent of truck tractor sales must be zero-emission vehicles. The goal of this rule is to accelerate the transition to zero-emission trucks. USEPA granted CARB's waiver request under the Clean Air Act to enact the more stringent fuel economy components of the Advanced Clean Trucks regulation on April 6, 2023. However, Public Law 119-17, enacted on June 12, 2025, disapproves this regulation under the Congressional Review Act, retroactively revoking the State's waiver issued by USEPA to implement the Advanced Clean Trucks regulation.

California Global Warming Solutions Act of 2006 (Assembly Bill 32 and Senate Bill 32)

The California Global Warming Solutions Act of 2006 (AB 32) outlined California's major legislative initiative for reducing GHG emissions. AB 32 codified the statewide goal of reducing GHG emissions to 1990 levels by 2020 and required CARB to prepare a Scoping Plan that outlined the main State strategies for reducing GHG emissions to meet the 2020 deadline. In addition, AB 32 required CARB to adopt regulations to require reporting and verification of statewide GHG emissions. Based on this guidance, CARB approved a 1990 statewide GHG level and 2020 target of 431 MMT of CO_2e, which was achieved in 2016. Senate Bill (SB) 32 extended the California Global Warming Solutions Act of 2006 by requiring the state to further reduce GHG emissions to 40 percent below 1990 levels by 2030 (the other provisions of AB 32 remained unchanged).

California Climate Crisis Act (Assembly Bill 1279)

As a follow up to AB 32 and SB 32, the California Climate Crisis Act, or AB 1279 of 2022 declares the State will achieve net zero GHG emissions[18] as soon as possible, but no later than 2045, and to achieve and maintain net negative GHG emissions thereafter. In addition, the bill indicates the State will reduce GHG emissions by 85 percent below 1990 levels no later than 2045. In response to the passage of AB 1279 and the identification of the 2045 GHG reduction target, CARB published the Final 2022 Climate Change Scoping Plan in November 2022.[19] The 2022 Scoping Plan builds upon the framework established by the previous Scoping Plans while identifying new, technologically-feasible, cost-effective, and equity-focused path to achieve California's climate target.

The 2022 Scoping Plan assesses the progress California is making toward reducing its GHG emissions by at least 40 percent below 1990 levels by 2030, and implements a target of reducing anthropogenic emissions to 85 percent below 1990 levels by 2045.

Sustainable Communities and Climate Protection Act of 2008 (Senate Bill 375)

The Sustainable Communities and Climate Protection Act of 2008 (SB 375) enhances the State's ability to reach AB 32 goals by directing CARB to develop regional GHG emission reduction targets to be achieved from passenger vehicles by 2020 and 2035. SB 375 aligns regional transportation planning efforts, regional GHG reduction targets, and affordable housing allocations. Metropolitan Planning Organizations are required to adopt a Sustainable Communities Strategy (SCS), which allocates land uses in the Metropolitan Planning Organization's Regional Transportation Plan (RTP).

[18] "Net zero" means that the amount of GHGs emitted by various sources (e.g., electricity generation, transportation, natural gas combustion, industrial processes) is equal to the amount of GHGs removed from the atmosphere via activities such as carbon sequestration and reforestation.
[19] California Air Resources Board (CARB). 2022. 2022 Scoping Plan for Achieving Carbon Neutrality. https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2022-scoping-plan-documents (accessed December 2025).

Qualified projects consistent with an approved SCS or Alternative Planning Strategy (categorized as "transit priority projects") can receive incentives to streamline CEQA processing.

In 2018, CARB adopted updated regional targets for reducing GHG emissions from 2005 levels by 2020 and 2035. CARB's GHG emission targets for years 2020 and 2035 are intended to help achieve significant GHG reductions from changes to land use patterns and improved transportation networks. Pursuant to SB 375, CARB is required to update the regional targets no later than 2026.

In August 2025, the Santa Barbara County Association of Governments (SBCAG)'s Board of Directors formally adopted an update to the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), also known as Connected 2050, which meets the requirements of SB 375.

Senate Bill 100

Adopted in 2018, SB 100 supports the reduction of GHG emissions from the electricity sector by accelerating the State's Renewables Portfolio Standard Program. SB 100 requires electricity providers to increase procurement from eligible renewable energy resources to 60 percent by 2030 and 100 percent by 2045.

Executive Order N-79-20

On September 23, 2020, Governor Newsom issued Executive Order N-79-20, which established the following new statewide goals:

- All new passenger cars and trucks sold in-state to be zero-emission by 2035;
- All medium- and heavy-duty vehicles in the state to be zero-emission by 2045 for all operations where feasible and by 2035 for drayage trucks; and
- All off-road vehicles and equipment to be zero-emission by 2035 where feasible.

Executive Order N-79-20 directs CARB, the Governor's Office of Business and Economic Development, the California Energy Commission, the California Department of Transportation, and other state agencies to draft regulations to achieve these goals.

Clean Energy, Jobs, and Affordability Act of 2022 (Senate Bill 1020)

Adopted in 2022, SB 1020 creates clean electricity targets for eligible renewable energy resources and zero-carbon resources to supply 90 percent of retail sale electricity by 2035, 95 percent by 2040, and 100 percent by 2045 as well as 100 percent of electricity procured to serve all State agencies by 2035. This bill requires that carbon emissions should not be increased elsewhere in the western grid to achieve these targets and does not allow resource shuffling.

California Building Code

California Code of Regulations (CCR) Title 24 is referred to as the California Building Code. It consists of several distinct standards and codes related to building construction, including plumbing, electrical, interior acoustics, energy efficiency, and accessibility. The current 2025 Title 24 standards became effective on January 1, 2026. Relevant portions of the energy-efficiency and green building standards in the California Building Code are summarized below.

Part 6 – Building Energy Efficiency Standards (California Energy Code)

CCR Title 24, Part 6 is the Building Energy Efficiency Standards or California Energy Code requires new construction and major renovations to demonstrate their compliance with the current California Energy Code through submittal and approval of a Title 24 Compliance Report to the local building permit review authority and the California Energy Commission. Key requirements include provisions for new residential buildings to be electric-ready (i.e., include necessary wiring and panel space for electric vehicle chargers and electric appliances) and for certain nonresidential and multi-family residential buildings to include solar photovoltaic and battery energy storage systems.

Part 11 – California Green Building Standards

The California Green Building Standards Code, referred to as CALGreen, was added to Title 24 as Part 11, first in 2009 as a voluntary code, then as mandatory code effective January 1, 2011. Some key requirements include the use of low-flow plumbing fixtures and water-efficient irrigation systems and a mandatory 65 percent diversion of construction waste from landfills. Local jurisdictions must enforce the minimum mandatory CALGreen standards and may adopt additional amendments for stricter requirements. The 2025 CALGreen also includes voluntary standards that serve as recommendations, examples, and templates for local jurisdictions to use and that can apply to newly constructed buildings and additions or alterations to existing buildings.

b. Local Regulations

SBCAG 2050 RTP/SCS

SBCAG adopted its 2050 RTP/SCS (titled Connected 2050) in August 2025. This plan updated the 2021 RTP/SCS and shows how the region will achieve the required SB 375. The 2050 RTP/SCS explores the region's land use and travel patterns, accounts for demographic and how to meet the State's GHG reduction targets. The 2050 RTP/SCS preferred scenario is a Transit-Oriented Development (TOD)/Infill plan that strives to accommodate future growth within existing urban areas along transit corridors. The intent of these proposed changes is to shorten trip distances and reduce vehicle miles traveled and emissions; directly addressing regional jobs/housing imbalance by providing more housing on the jobs-rich South Coast and more jobs in the North County; and promoting more trips, both local and inter-city, by alternative transportation modes, including by foot, bike, or transit. The 2050 RTP/SCS meets and exceeds the CARB 17 percent per capita reduction targets for GHG emissions from passenger vehicles for target year 2035.[20]

City of Santa Barbara Climate Action Plan

In June 2024, the Santa Barbara City Council adopted the City's Climate Action Plan (CAP), entitled *Together to Zero*, which is a qualified CAP pursuant to *CEQA Guidelines* Section 15183.5(b)(1). The CAP serves as the City's roadmap to achieve its climate goal of carbon neutrality by 2035. The CAP includes five core strategy areas: Building Energy Use, Transportation, Waste/Water and

[20] Santa Barbara County Association of Governments (SBCAG) 2025. Regional Transportation Plan and Sustainable Communities Strategy 2025 Update of Connected 2050 (2021). August 2025. https://www.sbcag.org/wp-content/uploads/2025/08/Connected2050_August2025.pdf (accessed December 2025).

Wastewater, Carbon Sequestration, and Community Potential. Several measures contained in the CAP would be applicable to the project, including the following:[21]

- Measure BE 1.3: Implement the municipal building decarbonization plan developed under BE-1.1 to decarbonize 100 percent of municipal buildings by 2035 (any buildings that are unable to be electrified due to technological infeasibility shall be decarbonized with other technology).
- Measure BE 1.4: Develop and implement a plan for retrofitting all remaining streetlights, facility lighting, and traffic signals to LEDs by 2035.
- Measure BE 1.6: Include, at the time of lease renewal, requirements for City-owned leased buildings and facilities to be all-electric.
- Measure W 2.1: Continue implementing City policies for water-conserving equipment upgrades and practices at City government facilities. Implement additional facility, landscape, and procedure improvements to further conserve water as identified and determined feasible.

In addition to these measures, the CAP includes the Master Environmental Assessment Guidelines for GHG Emissions Analysis (MEA Guidelines) and a CEQA GHG Checklist.

4.6.3 Impact Analysis

a. Significance Criteria and Methodology

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to greenhouse gas emissions would be significant if the proposed Project would:

1. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
2. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

As mentioned above, the Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 1 and 2 would be potentially significant.

The majority of individual projects do not generate sufficient GHG emissions to directly influence climate change. However, physical changes caused by a project can contribute incrementally to cumulative effects that are significant, even if individual changes resulting from a project are limited. The issue of climate change typically involves an analysis of whether a project's contribution towards an impact would be cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, other current projects, and probable future projects (*CEQA Guidelines*, Section 15064[h][1]).

According to the *CEQA Guidelines*, projects can tier from a qualified GHG reduction plan, which allows for project-level evaluation of GHG emissions through the comparison of the project's consistency with the GHG reduction policies included in a qualified GHG reduction plan. This approach is considered by the Association of Environmental Professionals [AEP] in its white paper,

[21] Santa Barbara, City Of. 2024b. Together To Zero Appendix D: Master Environmental Assessment Guidelines for Greenhouse Gas Emissions Analysis. May 2024. https://sustainability.santabarbaraca.gov/sites/default/files/2024-06/%285%29%202024%20CAP%20Appendix%20D%20MEA%20Guidelines%20for%20GG%20Emission%20Analysis.pdf (accessed December 2025).

Beyond Newhall and 2020, to be the most defensible approach presently available under CEQA to determine the significance of a project's GHG emissions.[22]

As described under Section 3.1.4, *Regulatory Setting*, the City of Santa Barbara has adopted a qualified CAP. The MEA Guidelines (Appendix D of the CAP) provides methodology for qualitatively determining a project's consistency with the CAP. This document includes CEQA screening criteria and a GHG checklist for projects to ensure they are consistent with the CAP's strategies. If a project is consistent with the CEQA screening criteria or GHG checklist contained in the MEA Guidelines, then the project can tier from the programmatic GHG emissions environmental review included in the adopted IS-ND for the CAP pursuant to *CEQA Guidelines* Section 15183.5(b)(1).[23]

Accordingly, this analysis uses the methodology from the MEA guidelines to determine potential significance of project GHG emissions. In addition, the project is evaluated based on consistency with the 2022 Scoping Plan and SBCAG 2050 RTP/SCS.

b. Project Impacts and Mitigation Measures

Threshold 1:	Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?
Threshold 2:	Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Impact GHG-1 THE GREENHOUSE GAS EMISSIONS GENERATED BY THE PROPOSED PROJECT WOULD BE CONSISTENT WITH THE CITY OF SANTA BARBARA CAP, SBCAG'S 2050 RTP/SCS, AND THE 2022 SCOPING PLAN. THEREFORE, THE PROPOSED PROJECT'S POTENTIAL IMPACTS ON GREENHOUSE GAS EMISSIONS WOULD BE LESS THAN SIGNIFICANT.

As discussed in Section 4.6.3.a, *Significance Criteria and Methodology*, the significance of GHG emissions generated by the Project is determined based on consistency with applicable plans, policies, or regulations adopted for the purpose of reducing GHG emissions. Therefore, Project consistency with Thresholds GHG-1 and GHG-2 is evaluated by considering the Project's consistency with applicable plans, including the City of Santa Barbara CAP, CARB's 2022 Scoping Plan, and the SBCAG 2050 RTP/SCS. If the Project is deemed consistent with these plans, then it can similarly be determined that Project-related GHG emissions would not have a significant impact on the environment.

Plan Consistency

2022 Scoping Plan

The primary state plans and policies are AB 32, the California Global Warming Solutions Act of 2006, and the subsequent legislation, SB 32 and AB 1279. The quantitative goal of AB 32 is to reduce GHG emissions to 1990 levels by 2020. The goal of SB 32 is to reduce GHG emissions to 40 percent below 1990 levels by 2030. In 2022, the State passed AB 1279, which declares the State would achieve net-zero GHG emissions by 2045 and would reduce GHG emissions by 85 percent below 1990 levels by 2045. The latest iteration of the Scoping Plan is the 2022 Scoping Plan, which focuses on outcomes

[22] Association of Environmental Professionals. 2016. Beyond Newhall and 2020: A Field Guide to New CEQA Greenhouse Gas Thresholds and Climate Action Plan Targets in California. October 18, 2016. https://califaep.org/docs/AEP-2016_Final_White_Paper.pdf (accessed December 2025).

needed to achieve carbon neutrality by assessing paths for clean technology, energy deployment, natural and working lands, and others, and is designed to meet the state's long-term climate objectives and support a range of economic, environmental, energy security, environmental justice, and public health priorities. The 2022 Scoping Plan's strategies that apply to the Project include the following:

- Reducing fossil fuel use, energy demand, and VMT.
- Building Carbonization.

The 2022 Scoping Plan Appendix D, Local Actions, provides suggestions for prioritizing mitigation, starting with onsite GHG-reducing design features and mitigation measures, such as reducing VMT, building decarbonization, access to shared mobility services or transit, and EV charging. The Project would replace an existing reservoir and would not result in a permanent increase in VMT or mobile source emissions, thereby not conflicting with the long-term Scoping Plan strategies.

The proposed Project would receive electricity from Southern California Edison, which is required to increase renewable electricity procurement to 100 percent by 2045 pursuant to SB 100. The Project would also involve construction of renewable energy generation and storage equipment to sustainably power the replaced valve building and pump station. The solar energy generation system would be 60 kilowatts (kW) and would power the onsite electrical facilities at a minimum. Additionally, development would occur at the exisiting reservoir site and would not result in the loss or conversion of natural and working lands. Therefore, the Project would not conflict with the 2022 Scoping Plan, and impacts involving conflict with the 2022 Scoping Plan would be less than significant.

SBCAG 2050 RTP/SCS

SBCAG has incorporated a sustainable community strategy into its RTP/SCS, which is designed to help the region achieve its SB 375 GHG emissions reduction target. The SBCAG 2050 RTP/SCS demonstrates that the SBCAG region would achieve its regional emissions reduction targets for the 2020 and 2035 target years. The RTP/SCS strategies include making land use decisions that adequately address regional transportation issues, promoting energy efficiency, and minimizing traffic impacts to reduce congestion and VMT.

The proposed Project would replace critical infrastructure in the City and would not result in a land use change that would affect regional transportation issues or traffic impacts. As discussed in Chapter 2, *Project Description,* the Project would not result in a permanent net increase in vehicle trips, thereby not conflicting with SBCAG policies aimed at improving mobility and reducing GHG emissions. Therefore, the Project would not conflict with the GHG emission reduction strategies contained in the 2050 RTP/SCS, and impacts involving conflict with the 2050 RTP/SCS would be less than significant.

City of Santa Barbara CAP

Step 1 of the MEA Guidelines evaluates whether or not the Project qualifies for any applicable exemption under CEQA. If the Project qualifies for an exemption, no further action is required. If the Project does not qualify for an exemption, then the lead agency would move to Step 2. Additionally, projects subject to further CEQA review or tiering requirements must proceed to Step 2. Because the proposed Project is not exempt from CEQA and requires preparation of an Environmental Impact Report, it must proceed to Step 2.

Step 2 determines if the Project involves new or substantially redeveloped residential, commercial, or mixed-use buildings, or additions of more than 2,000 square feet in building floor area to existing residential, commercial, or mixed-use buildings. If the Project meets the applicable screening criteria for new development, redevelopment, or building expansion, the screening process would continue to Step 3.

If the Project does not meet the above criteria, then the Project can qualitatively be assumed to be consistent with the CAP Update without using the CEQA GHG Checklist and completion of a CEQA GHG Checklist is not required.

The proposed Project consists of a reservoir replacement and would not involve development, redevelopment, or additions of residential, commercial, or mixed-use floor area. Therefore, based on the MEA Guidelines, the proposed Project would not conflict with the City of Santa Barbara CAP, and impacts involving conflict with the CAP would be less than significant.

4.6.4 Cumulative Impacts

The geographic scope for related projects considered in the cumulative impact analysis for GHG emissions is global because impacts of climate change are experienced on a global scale regardless of the location of GHG emission sources. Therefore, GHG emissions and climate change are, by definition, cumulative impacts. As discussed in Section 4.6.1(c), *Potential Effects of Climate Change*, the adverse environmental impacts of cumulative GHG emissions, including sea level rise, increased average temperatures, more drought years, and more large forest fires, are already occurring. As a result, cumulative impacts related to GHG emissions are significant. Thus, the issue of climate change involves an analysis of whether a project's contribution towards an impact is cumulatively considerable. As discussed under Impact GHG-1, the Project would be consistent with applicable plans adopted for the purpose of reducing GHG emissions. Therefore, Project-generated GHG emissions would not have a significant impact on the environment, and Project impacts related to GHG emissions would therefore not have a considerable contribution to the significant cumulative impact.

This page intentionally left blank.

4.7 Hazards & Hazardous Materials

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to hazards and hazardous materials would be significant if the proposed Project would:

1. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.
2. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.
3. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.
4. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would it create a significant hazard to the public or the environment.
5. For a project located within the Santa Barbara County Association of Governments Airport Land Use Compatibility Plan, Airport Influence Area, would the project result in a safety hazard or excessive noise for people residing or working in the project area.
6. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.
7. Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

The Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 1 and 3 through 7 would be less than significant or have no impact. These impacts are discussed in Initial Study Environmental Checklist Section 9, Hazards and Hazardous Materials (Appendix A). Thus, the following discussion solely focuses on Threshold 2.

4.7.1 Environmental Setting

a. Overview of Hazardous Materials

The term “hazardous materials” has different definitions for different regulatory programs. For the purpose of this Environmental Impact Report (EIR), the term “hazardous materials” refers to both hazardous materials and hazardous waste. California Health and Safety Code Section 25501(n)(1) defines a hazardous material as any material that “because of its quantity, concentrations, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment.” Hazardous materials include, but are not limited to, hazardous substances, hazardous waste, and any material that a handler or the administering agency has a reasonable basis for believing would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or environment.

A material is hazardous if it exhibits one or more of the following characteristics: toxicity, ignitability, corrosivity, and reactivity. These types of hazardous materials are defined below:

- **Toxic Substances.** Toxic substances are materials that are poisonous to living organisms and can cause health effects. Carcinogens, substances that can cause cancer, are a special class of toxic substances. Examples of toxic substances include benzene (a component of gasoline and suspected carcinogen) and lead (a known carcinogen).
- **Ignitable Substances.** Ignitable substances are hazardous because of their ability to burn. Gasoline, hexane, and natural gas are examples of ignitable substances.
- **Corrosive Materials.** Corrosive materials can cause severe burns. Corrosives include strong acids and bases such as sodium hydroxide (lye) or sulfuric acid (battery acid).
- **Reactive Materials.** Reactive materials may cause explosions or generate toxic gases. Explosives, pure sodium or potassium metals (which react violently with water), and cyanides are examples of reactive materials.

b. Overview of the Project Site

Historically, a portion of the Project site was used for an oil well operation. Currently the Project site is used for the Vic Trace Reservoir. These uses are described in greater detail below.

Historical Land Use

Rincon Consultants Inc. (Rincon) prepared an Environmental Site Investigation Work Plan (Work Plan) for the Project dated July 26, 2023 (Appendix H-1). The Work Plan identified the location of an on-site, plugged oil well and associated features (well cap, well cellar, and drilling sump) and proposed the assessment of present or absent "sump material," shallow soil along the perimeter of the existing reservoir structure for potential lead impacts to shallow soils, and a hazardous building materials survey of the onsite structures. Santa Barbara County Public Health Department, Environmental Health Services (EHS) reviewed the Work Plan and approved with comments on October 4, 2023. As part of the Work Plan, Rincon reviewed historical aerial photographs and topographic maps of the Project site. This review of past records demonstrated the Project site was historically used for an oil well operation, before the construction of the existing Vic Trace Reservoir in 1956 (Appendix H-1).

The Project site was recorded within the boundaries of the abandoned Mesa Oil Field. From 1938 to 1954, aerial photographs depicted sump features associated with oil well operations on a portion of the Project site. From 1956 to present day, aerial photographs depict the construction and current operation of the Vic Trace Reservoir on-site (Appendix H-1).

Current Project Site Conditions

As part of the Environmental Site Investigation Work Plan (Appendix H-1), Rincon prepared a Data Summary Submittal reporting the results of the shallow soil assessment performed along the perimeter of the reservoir and associated valve building, and hazardous building materials survey (Appendix H-3).

The Regional Water Quality Control Board's Environmental Screening Levels (ESLs) were applied to evaluate soil data.[1] These health-conservative thresholds are protective of human health and the environment, and are used statewide by Regional Water Boards, including the Central Coast. Soil results were compared to Tier 1 ESLs, Construction Worker ESLs, and Commercial/Industrial ESLs for

[1] San Francisco Bay Regional Water Quality Control Board (SFBRWQCB). 2019. Environmental Screening Levels. July 2019, revision 2.

lead. Metals were also evaluated against regional background concentrations[2] when background levels exceed risk-based screening levels (Appendix H-3).

Shallow Soil Sampling

In October 2023, Rincon collected 25 shallow soil samples at approximately 0.5 feet below ground surface (bgs) from locations surrounding the reservoir and valve building. No soil discoloration or odors were observed during sampling. Laboratory analysis detected lead concentrations ranging from 5.01 to 19.4 milligrams per kilogram (mg/kg) in shallow soils, which were below the Tier 1 ESL of 32 mg/kg, Construction Worker ESL of 160 mg/kg, and Commercial/Industrial ESL of 320 mg/kg. All detected concentrations were within or below the regional background range of 12.4 to 97.1 mg/kg (Appendix H-3). The Santa Barbara County Public Health Department Environmental Health Services (EHS) indicated in a letter dated February 6, 2024 that based on their review of the Environmental Site Investigation Data Submittal report, "no mitigation of this soil is warranted, at this time" (Appendix H-4).

Hazardous Building Materials Surveys

FCG Environmental conducted a hazardous building materials survey of the reservoir and valve building in November 2023, including visual inspection, asbestos-containing material (ACM) sampling, and lead-based paint (LBP) screening using XRF analysis. Laboratory analysis of 23 bulk samples for asbestos and three samples for lead was performed by SGS Forensic Analytical. Results indicated that asbestos was not detected above the laboratory detection limit in any sampled materials, and corrugated aluminum roofing and siding contained only minor lead concentrations (12-30 parts per million), below regulatory thresholds (Appendix H-3).

Insight Environmental Inc. conducted a hazardous building materials survey of the valve building interior, as well as the Communications/IT Building, in February 2026. This hazardous building materials survey consisted of a visual inspection of representative building materials, ACM and LBP surveys and sampling, and laboratory analysis. Results indicated that asbestos was not detected above the laboratory detection limit in any sampled materials, and LBP was detected on a metal valve and metal beam within the valve building interior at concentrations greater than 1.0 milligrams per square centimeter (Appendix H-5).

Oil and Gas Well

The Mesa Oil Field, discovered in 1929, was developed and quickly declined due to limited oil accumulation. In 1935 and prior to the construction of the Vic Trace Reservoir, the Beckstead 1 oil well was drilled within the Project site boundaries. The operator of the well was the Dralock Oil Company and the American Petroleum Institute well identification number for the well is 0408303644 (Appendix H-1).

Oil well records obtained online from California Department of Conservation Geologic Energy Management Division (CalGEM) indicate the well was drilled in August – September 1935 to a total depth of 1,578 feet below grade. Based on the review of the available records, no oil or gas "showings" were encountered, and the well was abandoned on September 14, 1935. The "dry hole" was filled with heavy mud from total depth to 134 feet. After a wooden plug was driven to a depth of 136 feet, cement was added, and the top of the cement was measured at a depth of 75 feet

[2] Kearney Foundation. 1996. Background Concentrations of Trace and Major Elements in California Soils. Kearney Foundation of Soil Science, Division of Agriculture and Natural Resources, University of California. March 1996

below grade. The plugged oil well and associated sump features are located beneath the existing Vic Trace Reservoir (Appendix H-1).

The abandoned oil well and associated sump features remain beneath the existing reservoir, and the Project site has since transitioned to water-storage infrastructure. As part of ongoing coordination with CalGEM for the proposed Project, the City initiated administrative actions required for future re-abandonment activities. In January 2026, the City completed the transfer of ownership of the Beckstead 1 well to the City and submitted the required financial assurance (bonding) documentation to CalGEM. These administrative steps reflect current well ownership and regulatory status within the Project site.

Hazardous Substances

Asbestos

According to the United States Environmental Protection Agency (USEPA), asbestos is used in a variety of building construction materials for insulation and as a fire retardant due to its durability and heat resistance. In 1973, USEPA banned spray-applied surfacing asbestos-containing materials (ACM) for fireproofing/insulating purposes.[3] Asbestos fibers may be released into the air by the disturbance of ACM during product use and demolition work. Exposure to asbestos could lead to harmful health effects and increased risk of developing lung disease.[3] As discussed above, the existing water infrastructure was constructed in approximately 1956, with several improvements and alterations taking place since 1956. The results of the 2023 hazardous building materials survey conducted for the reservoir and valve building did not indicate the presence of ACM, however, surveying of the valve building structure was limited to the roofing and exterior concrete.

Lead

Lead is a naturally occurring element that can be toxic to humans and animals, and lead exposure can result in health effects, especially in children. Lead and lead compounds have been used in a variety of consumer products, including lead-based paint (LBP), ceramics, pipes and plumbing materials, solders, gasoline, batteries, ammunition, and cosmetics.[4] In 1978, consumer uses of LBP were banned.[5] Because the existing reservoir was constructed prior to 1978, there is the potential for LBP to be present in building materials not readily accessible in the 2023 hazardous building materials survey, as indicated previously. The results of the 2026 hazardous building materials survey conducted for the valve building interior and Communications/IT building indicated the presence of LBP within the valve building interior at concentrations greater than 1.0 milligrams per square centimeter (Appendix H-5).

Polychlorinated Biphenyls

Polychlorinated biphenyls (PCB) are a group of man-made organic chemicals which have a range of toxicity and vary in consistency from thin, light-colored liquids to yellow or black waxy solids. Due to their non-flammability, chemical stability, high boiling point, and electrical insulating properties, PCBs were used in hundreds of industrial and commercial applications including electric and heat

[3] United States Environmental Protection Agency. 2025. EPA Actions to Protect the Public from Exposure to Asbestos. https://www.epa.gov/asbestos/epa-actions-protect-public-exposure-asbestos (accessed January 2026).
[4] United States Environmental Protection Agency. 2025. Learn about Lead. https://www.epa.gov/lead/learn-about-lead (accessed January 2026).
[5] United States Environmental Protection Agency. 2025. Protect Your Family from Sources of Lead. https://www.epa.gov/lead/protect-your-family-sources-lead (accessed January 2026).

transfer, pigments, dyes, and other industrial applications. PCBs have also been used commercially in products and materials such as fluorescent light ballasts, electrical equipment, motors and hydraulic systems, adhesives and tapes, and caulking. In 1979, PCB manufacturing was banned in the United States.[6] Due to the age of the existing building, there is the potential for PCB-containing materials to be present in building materials.[7]

4.7.2 Regulatory Setting

a. Federal Regulations

Occupational Safety and Health Act Standard 1917.156

Created by the Occupational Safety and Health Act of 1970 (Code of Federal Regulations [CFR] Title 29), the Occupational Safety and Health Administration (OSHA) is the federal agency responsible for ensuring worker safety. OSHA regulations provide standards for safe workplaces and work practices, including those relating to hazardous materials handling. Standard 1917.156 designates fueling locations, regulates liquid fuel, and specifies standards for fueling operation and storage.

Hazardous Materials Transportation Act

The United States Department of Transportation, in conjunction with USEPA, is responsible for enforcement and implementation of federal laws and regulations pertaining to transportation of hazardous materials. The Hazardous Materials Transportation Act of 1974 (49 United States Code 5101) directs the United States Department of Transportation to establish criteria and regulations for the safe storage and transportation of hazardous materials. 49 CFR Parts 171 to 180 define the types of material classified as hazardous, regulate the transportation of hazardous materials, and specify the marking of vehicles transporting hazardous materials.

Resource Conservation and Recovery Act

The Resource Conservation and Recovery Act (RCRA) of 1976 established a program administered and enforced by USEPA for the regulation of the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA gives USEPA the authority to regulate hazardous waste from "cradle to grave," meaning anyone involved in the lifecycle of hazardous waste, from creation to disposal, must comply with RCRA regulations.

Hazardous and Solid Waste Amendments Act of 1984

The Hazardous and Solid Waste Amendments Act amended RCRA by extending the "cradle to grave" system of regulating hazardous wastes and specifically prohibited the use of certain techniques for the disposal of some hazardous wastes. The Hazardous and Solid Waste Amendments Act includes more than 70 provisions, including the establishment of permitting deadlines for hazardous waste facilities, the regulation of small-quantity generators of hazardous waste, and the formation of RCRA Corrective Action requirements, which assist hazardous waste facilities in investigating and cleaning up any release of hazardous waste.

[6] United States Environmental Protection Agency. 2025. Learn about Polychlorinated Biphenyls. https://www.epa.gov/pcbs/learn-about-polychlorinated-biphenyls (accessed January 2026).
[7] PCBs were not included in the 2023 or 2026 hazardous materials buildings surveys.

Toxic Substances Control Act

Congress enacted the Toxic Substances Control Act (TSCA) of 1976, codified in CFR Title 40, to give USEPA the ability to track the 75,000 industrial chemicals currently produced or imported into the United States. USEPA repeatedly screens these chemicals and can require reporting or testing of those that may pose an environmental or human-health hazard. USEPA can ban the manufacture and import of those chemicals that pose an unreasonable risk. In California, PCBs are regulated by both State (Title 22 of the California Code of Regulations [CCR]) and federal (TSCA) rules. TSCA has banned the manufacture, processing, use, and distribution in commerce of PCBs. TSCA gives USEPA the authority to develop, implement, and enforce regulations concerning the use, manufacture, cleanup, and disposal of PCBs. TSCA also establishes USEPA's Lead Abatement Program regulations, which provide a framework for lead abatement, risk assessment, and inspections. Those performing these services are required to be trained and certified by USEPA.

Emergency Planning and Community Right-to-Know Act

The Emergency Planning and Community Right-to-Know Act was created under SARA Title III to help communities protect public health and safety from chemical hazards. The national legislation requires each state to appoint a State Emergency Response Commission, which then divides each state into Emergency Planning Districts and nominates a Local Emergency Planning Committee for each district. The Emergency Planning and Community Right-to-Know Act provides compliance and reporting standards as well as waste, chemical, and cleanup enforcement, allowing each district to plan and prepare thoroughly should a hazardous waste accident or release arise.

Spill Prevention, Control, and Countermeasure Rule

The Spill Prevention, Control, and Countermeasure (SPCC) Rule (40 CFR Part 112) was enacted to provide engineering, operational, maintenance, and management strategies that minimize the potential for a spill or release of oil products, such as fuel and petroleum/lubricating oil, from certain storage and operational equipment and activities and to prevent an oil spill from entering a waterway. SPCC requirements in 40 CFR Part 112 apply to owners or operators of non-transportation-related onshore and offshore facilities engaged in drilling, producing, gathering, storing, processing, refining, transferring, distributing, or consuming oil or oil products that store more than 1,320 gallons total in all aboveground containers of 55 gallons or greater storage capacity. Facilities subject to the rule must prepare and implement an SPCC Plan.

b. State Regulations

Hazardous Waste Control Law

The Department of Toxic Substances Control (DTSC), a department of CalEPA, is the primary agency in California that regulates hazardous waste, cleans up existing contamination, and researches ways to reduce the hazardous waste produced in California. DTSC regulates hazardous waste in California primarily under the authority of RCRA and the California Health and Safety Code. DTSC also administers the California Hazardous Waste Control Law (California Health and Safety Code Section 25100, et seq.) to regulate hazardous wastes. The Hazardous Waste Control Law lists chemicals and common materials that may be hazardous; establishes criteria for identifying, packaging, and labeling hazardous wastes; prescribes management controls; establishes permit requirements for treatment, storage, disposal, and transportation; and identifies some wastes that cannot be disposed of in landfills.

California Government Code Section 65962.5

California Government Code Section 65962.5 requires DTSC, the California Department of Health Services, SWRCB, and the California Department of Resources, Recycling, and Recovery (CalRecycle) to compile and annually update lists of hazardous waste sites and land designated as hazardous waste sites throughout the state. The Secretary for Environmental Protection consolidates the information and distributes it to each city and county where sites on the lists are located. Before the lead agency accepts an application for any development project as complete, the applicant must consult these lists to determine if the site at issue is included. If any soil is excavated from a site containing hazardous materials, it is considered a hazardous waste if it exceeds specific criteria in CCR Title 22. Remediation of hazardous wastes may be required if excavation of these materials is performed, or if certain other soil-disturbing activities would occur. Even if soil at a contaminated site does not have the characteristics required to be defined as hazardous waste, remediation of the site may be required by regulatory agencies subject to jurisdictional authority. Cleanup requirements are determined on a case-by-case basis by the agency taking jurisdiction.

Environmental Health Standards for the Management of Hazardous Waste Law

Title 22 CCR Division 4.5, Chapter 11, Sections 66261.20 through 66261.24 contain technical descriptions of characteristics that would classify waste material, including soil, as hazardous waste. Specifically, waste is considered hazardous if it is toxic, ignitable, corrosive, or reactive pursuant to the criteria established in Title 22 CCR Division 4.5, Chapter 11, Article 3. When excavated, soils with concentrations of contaminants higher than certain acceptable levels must be handled and disposed of as hazardous waste. When demolished, structural features containing LBP can also be considered hazardous waste, depending on concentrations, and must be handled and disposed of as hazardous waste.

California Code of Regulations, Title 8, Section 1532.1

Because of its toxic properties, lead is regulated as a hazardous material as well as a toxic air contaminant. State-certified contractors must perform inspection, testing, and removal (abatement) of lead-containing building materials in compliance with applicable health and safety and hazardous materials regulations. These regulations cover the demolition, removal, cleanup, transportation, storage, and disposal of lead-containing material. The regulations outline the permissible exposure limit, protective measures, monitoring, and compliance to ensure the safety of construction workers exposed to lead-based materials. The California Division of Occupational Safety and Health's (Cal/OSHA) Lead in Construction Standard requires project proponents to develop and implement a lead compliance plan when LBP would be disturbed during construction.

California Code of Regulations, Title 14, Section 1723

Because of the potential environmental and safety risks associated with improperly abandoned wells, California Geologic Energy Management Division (CalGEM), establishes detailed technical standards for plugging and re-abandonment of oil and gas wells (CCR Title 14). These regulations govern the placement, composition, and verification of cement plugs to ensure long-term well integrity and protection of groundwater resources. The rules require operators to design and install plugs across hydrocarbon zones, freshwater intervals, and at the surface, using materials approved by CalGEM. Additionally, operators are required to provide advance notice for CalGEM inspectors to witness and verify plug placement and hardness.

Public Resources Code

Sections 3204, 3205, 3205.1, 3205.2, and 3205.5

Public Resources Code (PRC) Sections 3204, 3205, 3205.1, 3205.2, and 3205.5 establish the State of California's financial assurance requirements for operators engaged in drilling, redrilling, deepening, or permanently altering the casing of oil and gas wells. These sections require operators to file an indemnity bond or deposit in lieu of bond with CalGEM to ensure adequate financial security is in place prior to conducting subsurface work. The bonding requirement applies to both new operations and modifications of existing wells and is intended to safeguard against the potential environmental and public health risks associated with improper well construction, abandonment, or maintenance activities.

Sections 3202, 3204, and 3205.1

Under PRC Sections 3202, 3204, and 3205.1, operators are required to provide evidence of an indemnity bond at key regulatory milestones. The bond must be filed at the time an operator submits a Notice of Intention (NOI) to perform drilling, redrilling, casing alteration, or other regulated well operations. The statutes additionally require that any operator acquiring a well through purchase, transfer, assignment, conveyance, exchange, or similar transaction must file the applicable bond at the time of ownership transfer.

c. Local Regulations

Santa Barbara County Air Pollution Control District Rules

The Santa Barbara County Air Pollution Control District (SBAPCD) oversees air emission standards to protect air quality and public health. The rules and regulations detail air emission measures that must be implemented during demolition, construction, and operation of projects. Rules and regulations relevant to hazards and hazardous materials include the following:[8]

- **Rule 345 (Control of Fugitive Dust from Construction and Demolition Activities).** Mandates implementation of dust control measures (e.g., watering, covers and street sweeping) to prevent visible fugitive dust emissions during site disturbance, grading, hauling, or other construction operations.
- **Rule 1206 (Asbestos Removal, Renovation, and Demolition)**. Establishes work practice requirements and notification procedures to control asbestos emissions during demolition or renovation of structures that may contain asbestos-containing materials.

General Plan

The City of Santa Barbara's Safety Element outlines several goals and policies related to hazards and hazardous materials.[9] Relevant polices include:

[8] Santa Barbara County Air Pollution Control District. 2010. Control of Fugitive Dust from Construction and Demolition Activities. https://www.ourair.org/wp-content/uploads/Rule345.pdf (accessed January 2026).
[9] Santa Barbara, City of. 2013a. General Plan Safety Element. https://santabarbaraca.gov/sites/default/files/documents/General%20Plan/General%20Plan/Safety%20Element.pdf (accessed January 2026).

- **Policy S7 Hazard Reduction.** Identify, evaluate and implement risk reduction measures during the development review and permitting process to reduce the effects of hazards to an acceptable level of risk. Project design measures shall be implemented as applicable to avoid or reduce hazards and comply with associated regulations.
- **Policy S9 Risk Evaluation.** Proposals for new development may be required to provide an evaluation of how natural and human-caused hazards may adversely affect the project whether the project may create or exacerbate hazards, and to identify feasible measures to reduce hazard-related risk to an acceptable level. Required hazard evaluation reports are to be prepared and signed by a qualified individual acceptable to the City. At its discretion, the City may require peer review of submitted reports. Factors to be considered in determining whether a risk evaluation is required include the project's location and intended use, the nature and severity of potential natural or human-caused hazards, the project's vulnerability to those hazards, and consistency with applicable federal, state, and local hazard regulations and technical guidelines.

Municipal Code

Santa Barbara Municipal Code (SBMC) Chapter 30.180 sets performance standards for the use, handling, storage, and transportation of hazardous materials.[10]

4.7.3 Impact Analysis

a. Significance Criteria and Methodology

Significance Criteria

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to hazards and hazardous materials would be significant if the proposed Project would:

2. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

As mentioned above, the Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 1 and 3 through 7 would be less than significant or have no impact. These impacts are discussed in Initial Study Environmental Checklist Section 9, Hazards and Hazardous Materials (Appendix A). Thus, the following discussion solely focuses on Threshold 2.

Methodology

Project impacts to hazards and hazardous materials are evaluated based on the Project's adherence to local, State, and federal standards and the nature of demolition, construction, and operational activities.

[10] Santa Barbara, City of. 2026. Santa Barbara Municipal Code; Chapter 30.180 Performance Standards. https://ecode360.com/44117247#44117247 (accessed January 2026).

b. Project Impacts and Mitigation Measures

Threshold 2:	Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment?

Impact HAZ-1 CONSTRUCTION OF THE PROPOSED PROJECT COULD RESULT IN THE ACCIDENTAL RELEASE OF HAZARDOUS MATERIALS THROUGH DEMOLITION OF THE EXISTING RESERVOIR, ABANDONMENT OF THE OIL WELL, AND GRADING OF POTENTIALLY CONTAMINATED SOILS. HOWEVER, REQUIRED COMPLIANCE WITH APPLICABLE REGULATIONS RELATED TO HAZARDOUS MATERIALS WOULD MINIMIZE THE RISK OF RELEASES AND EXPOSURE TO THESE MATERIALS. IMPACTS WOULD BE LESS THAN SIGNIFICANT.

Construction

Hazardous Materials in Existing Structures

The Project would involve the demolition of the existing 10-million-gallon (MG) Vic Trace Reservoir with two new 5 MG reservoirs at the same site and re-abandonment of the abandoned oil well. Construction of the Project would involve the use, storage, and disposal of hazardous materials, such as construction equipment fuels and lubricants.

Reasonably foreseeable upset and accident conditions that could occur from the use of hazardous materials in existing Project structures include direct contact of these materials on skin, incidental ingestion of hazardous materials, or inhalation of airborne dust released from dried hazardous materials. The use of hazardous materials could also result in accidental spills, leaks, toxic releases, fire, or explosion. A summary of regulatory requirements imposed to reduce the potential for these conditions include:

- Documentation - Appropriate documentation for all hazardous waste that is transported, stored, or used in connection with Project construction would be provided as required for compliance with existing hazardous materials regulations codified in the CCR. Compliance with federal, state, and local laws and regulations, as well as Cal/OSHA training programs, would minimize potential impacts associated with the accidental release of hazardous materials during demolition and construction activities.
- Regulations - The Spill Prevention, Control, and Countermeasure (SPCC) Rule (40 CFR Part 112), the California Hazardous Waste Control Law, and the California Accidental Release Prevention (CalARP) Program provide further requirements for spill prevention, safe handling, and emergency response procedures for hazardous materials used or stored during construction.

Collectively, the regulatory requirements imposed reduce the likelihood of accidental releases; therefore, impacts associated with reasonably foreseeable upset or accident conditions involving hazardous materials would be less than significant.

Asbestos. The results of the 2023 and 2026 hazardous building materials surveys conducted for the reservoir, valve building, and Communications/IT building did not indicate the presence of ACM. However, there is the potential that previously unidentified ACMs could be discovered during site renovation/demolition work. This could include unidentified materials located inside or under the reservoir structure. In California, any facility known to contain ACMs is required to have a written asbestos management plan (also known as an Operations and Maintenance Program). SBCAPCD enforces the Asbestos National Emission Standards for Hazardous Air Pollutants, which regulates

the control of asbestos during the renovation and demolition of buildings under the federal Clean Air Act.[11] Additionally, Cal/OSHA Title 8, Section 1529 sets requirements for asbestos exposure assessments and monitoring, methods of complying with exposure requirements, personal protective equipment, communication of hazards, and medical examination of workers. Similarly, the removal of LBP-containing materials would be subject to specific and detailed Cal/OSHA requirements to ensure proper containment, handling, notification, and monitoring, and removal would be performed by a licensed LBP abatement contractor. Because the existing reservoir was constructed prior to 1978, there is the potential for LBP to be present in building materials. Furthermore, the results of the 2026 hazardous materials building survey indicated the presence of LBP within the valve building interior at concentrations greater than Santa Barbara County's action level of 1.0 milligrams per square centimeter (Appendix H-5).

Lead. Cal/OSHA Title 8, Section 1532.1 requires testing, monitoring, containment, and disposal of lead-based materials such that exposure levels do not exceed Cal/OSHA standards. Under this rule, construction workers may not be exposed to lead at concentrations greater than 50 micrograms per cubic meter of air averaged over an eight-hour period, and exposure must be reduced to lower concentrations if the workday exceeds eight hours. Furthermore, as required by CCR Title 17, Section 36100, the City of Santa Barbara would be required to submit Form 8551 to CDPH prior to performing lead hazard abatement, which would require information related to the structure, construction activities, and construction restrictions.

PCBs. Cal/OSHA Title 8, Section 339 provides guidelines for handling and training related to potential PCB exposure. Workers who handle PCBs must receive training on safe handling practices, emergency procedures, and the health risks associated with PCB exposure, ensuring that they are knowledgeable and prepared to manage PCBs safely. In the event of PCB contamination, strict cleanup protocols must be followed to remove PCBs from the environment and prevent exposure.

The potential removal of ACMs, LBP, or PCBs during demolition of the reservoir would be subject to applicable laws and regulations enforced by SBCAPCD, Cal/OSHA, and CDPH, thereby minimizing the risk of potential impacts associated with reasonably foreseeable upset and accident conditions involving the release of ACMs, LBP, or PCBs into the environment. This impact would be less than significant.

Hazardous Materials in Soil

The Project site is underlain by soils that have the potential to contain hazardous materials. Various aspects of the Project are described below:

Lead-impacted Soils. According to the Data Summary Submittal – Environmental Site Investigation (Appendix H-3), lead-impacted soil extends approximately 0.5 feet bgs on-site at concentrations ranging from 5.01 to 19.4 mg/kg surrounding the reservoir, which are either below or within the Background Level concentration range of 12.4 to 97.1 mg/kg and below the Tier 1 ESL, Construction Worker ESL, or Commercial/Industrial ESL for lead in soil. The EHS indicated in a letter dated February 6, 2024 that based on their review of the Environmental Site Investigation Data Submittal report, "no mitigation of this soil is warranted, at this time."[12] Therefore, no mitigation measures, or

[11] United States Environmental Protection Agency. 2025. Overview of the Asbestos National Emission Standards for Hazardous Air Pollutants (NESHAP). https://www.epa.gov/asbestos/asbestos-laws-and-regulations#neshap (accessed January 2026).
[12] Santa Barbara County Public Health Department Environmental Health Services. 2024. Site Assessment Report, Vic Trace Reservoir. Via SWRCB "GeoTracker" website: https://documents.geotracker.waterboards.ca.gov/regulators/deliverable_documents/8733655631/EH-CMP-24-00029%2002_24.pdf (accessed January 2026).

special handling or management for lead-impacted shallow soils would be required along the perimeters of the reservoir or valve building.

Oil Well and Oil-impacted Soils. The plugged Beckstead 1 oil well and associated sump features located on the Project site beneath the reservoir may be associated with potentially oil-impacted material or soil. Therefore, proposed Project construction activities could potentially disturb hazardous materials in soils located in the vicinity of the oil well and sump area. Ground-disturbing activities generating fugitive dust would have the potential to result in the release of hazardous materials into the environment if not handled properly, which could create a significant hazard to the public and/or the environment.

Following reservoir demolition and prior to grading, a qualified environmental professional (Professional Geologist [PG] or Professional Engineer [PE]) would complete a subsurface investigation consistent with the procedures outlined in the Environmental Site Investigation Work Plan approved by EHS. The Work Plan specifies the sampling strategy, the analyte list, the depth intervals to be investigated in the vicinity of the plugged oil well and former sump area, and the requirement that analytical results be compared to applicable Environmental Screening Levels to evaluate construction-related exposure potential. As confirmed in the February 2024 EHS correspondence, this investigation approach is sufficient to characterize potential petroleum-related soil impacts associated with the historical oil well and sump features. The findings of the subsurface investigation would be documented in a report that includes soil characterization results, evaluation of potential exposure pathways during construction, and recommendations for managing material encountered during excavation. The subsurface investigation report would be submitted to EHS for review and approval, and if EHS requires additional assessment, remediation, or other activities prior to issuing a “no further action” (or similar) designation, such documents would be submitted to EHS for review and approved by EHS prior to issuing grading permits.

Moreover, re-abandonment of the Beckstead 1 oil well would be conducted under the authority and technical standards of the CalGEM, pursuant to CCR, Title 14, Section 1723, establishing detailed requirements for plug placement, cement composition, verification procedures, and CalGEM inspector witnessing to ensure long-term well integrity and protection of groundwater and surface resources. In addition to plugging requirements, ownership and financial assurance obligations associated with regulated oil well activities are governed by PCR Sections 3202, 3204, and 3205.1 through 3205.5, which require operators to maintain continuous bonding coverage and to submit a Notice of Intention to perform well work prior to re-abandonment. As stated in Section *4.7.1,* the City completed the administrative transfer of ownership of the oil well to CalGEM’s satisfaction and submitted the required bonding documentation, thereby establishing current regulatory compliance and enabling coordination of oil well re-abandonment activities with the planned reservoir replacement.

Construction Worker Safety and Soil Management Plan (SMP). As a result of current regulatory agency oversight by and coordination with EHS, a SMP would likely be required to establish engineering controls and soil management practices to protect construction worker safety, protect the health of future workers and visitors, and prevent the off-site migration of contaminants from the Project. Prior to site grading, a SMP would be prepared by a qualified environmental professional (PG or PE) and would establish measures and practices for dust control, stockpiled material management, investigation and handling procedures for odorous or visibly stained soils, proper disposal of contaminated materials, monitoring, and reporting. The SMP would also include an environmental health and safety plan for contractors working at the Project site, which addresses

the health and safety requirements and procedures to minimize worker and public exposure to hazardous materials during construction. The SMP would be submitted to EHS for review and approved by EHS prior to issuing grading permits. The SMP would be implemented during grading and construction at the Project site. Therefore, construction impacts would be less than significant.

Operation

The risk of hazardous materials creating a significant hazard to the public or the environment would primarily occur during construction of the proposed Project as on-site contamination is disturbed. Once the Project is operational, the contaminated media would mostly be removed and would no longer pose a risk. Further, once the oil well is properly re-abandoned, the oil well should no longer pose a risk. Therefore, operational impacts would be less than significant.

4.7.4 Cumulative Impacts

Generally, hazards and hazardous materials impacts associated with individual developments are site-specific in nature and must be addressed on a case-by-case basis. As such, the geographic scope for hazardous materials impacts is the Project site and immediately surrounding parcels. Cumulative development includes foreseeable future projects from Table 3-1 in Chapter 3, *Environmental Setting*, within the geographic scope. If LBP, ACMs, or PCBs are found to be present on the existing reservoir to be demolished, or if soil contamination is found on sites of future development, the City of Santa Barbara and its construction contractor would be required to comply with existing applicable local, State, and federal regulations, similar to the proposed Project. Hazard evaluations would be completed on a case-by-case basis for future development. Compliance with applicable regulations and implementation of appropriate mitigation measures, including remedial action on contaminated sites, would address impacts related to these hazards and hazardous materials associated with future development in the City. Therefore, cumulative impacts related to accidental release of hazardous materials would be less than significant.

This page intentionally left blank.

4.8 Noise

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to noise and vibration would be significant if the proposed Project would:

1. Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.
2. Generate excessive groundborne vibration or groundborne noise levels.
3. For a project located within the vicinity of a private airstrip or the SBCAG Airport Land Use Plan/Airport Influence Area, expose people residing or working in the project area to excessive noise levels.

The Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Threshold 3 would have no impact. Thus, the following discussion solely focuses on Thresholds 1 and 2.

4.8.1 Setting

Environmental Noise

Sound is a vibratory disturbance created by a moving or vibrating source, which is capable of being detected by the hearing organs. Noise is defined as sound that is loud, unpleasant, unexpected, or undesired and may therefore be classified as a more specific group of sounds. The effects of noise on people can include general annoyance, interference with speech communication, sleep disturbance, and, in the extreme, hearing impairment.[1]

Noise levels are commonly measured in decibels (dB) using the A-weighted sound pressure level (dBA). The A-weighting scale is an adjustment to the actual sound pressure levels so that they are consistent with the human hearing response. Decibels are measured on a logarithmic scale that quantifies sound intensity. A doubling of the energy of a noise source, such as doubling of traffic volume, would increase the noise level by 3 dB; dividing the energy in half would result in a 3 dB decrease.

Human perception of noise has no simple correlation with sound energy: the perception of sound is not linear in terms of dBA or in terms of sound energy. Two sources do not “sound twice as loud” as one source. It is widely accepted that the average healthy ear can barely perceive changes of 3 dBA, increase or decrease (i.e., twice the sound energy); that a change of 5 dBA is readily perceptible; and that an increase (or decrease) of 10 dBA sounds twice (or half) as loud.

Sound changes in both level and frequency spectrum as it travels from the source to the receptor. The most obvious change is the decrease in level as the distance from the source increases. The manner by which noise reduces with distance depends on factors such as the type of sources (e.g., point or line, the path the sound will travel, site conditions, obstructions). Noise levels from a point source typically attenuate, or drop off, at a rate of 6 dBA per doubling of distance (e.g., construction, industrial machinery, ventilation units). Noise from a line source (e.g., roadway, pipeline, railroad) typically attenuates at about 3 dBA per doubling of distance. The propagation of

[1] California Department of Transportation (Caltrans). 2013. Technical Noise Supplement to the Traffic Noise Analysis Protocol. https://dot.ca.gov/-/media/dot-media/programs/environmental-analysis/documents/env/tens-sep2013-a11y.pdf (accessed March 2026).

noise is also affected by the intervening ground, known as ground absorption. A hard site, such as a parking lot or smooth body of water, receives no additional ground attenuation and the changes in noise levels with distance (drop-off rate) result from simply the geometric spreading of the source. An additional ground attenuation value of 1.5 dBA per doubling of distance applies to a soft site (i.e., soft dirt, grass, or scattered bushes and trees).[1] Noise levels may also be reduced by intervening structures; the amount of attenuation provided by this "shielding" depends on the size of the object and the frequencies of the noise levels. Natural terrain features such as hills and dense woods, and man-made features such as buildings and walls, can significantly alter noise levels. Generally, any large structure blocking the line of sight will provide at least a 5-dBA reduction in source noise levels at the receptor.[2] Structures can substantially reduce exposure to noise as well. The FHWA's guidelines indicate that modern building construction generally provides an exterior-to-interior noise level reduction of 20 to 35 dBA with closed windows.

The impact of noise is not a function of loudness alone. The time of day when noise occurs and the duration of the noise are also important factors of project noise impact. Most noise that lasts for more than a few seconds is variable in its intensity. Consequently, a variety of noise descriptors have been developed. One of the most frequently used noise metrics is the equivalent noise level (L_{eq}); it considers both duration and sound power level. L_{eq} is defined as the single steady A-weighted level equivalent to the same amount of energy as that contained in the actual fluctuating levels over time. Typically, L_{eq} is summed over a one-hour period. L_{max} is the highest root mean squared (RMS) sound pressure level within the sampling period, and L_{min} is the lowest RMS sound pressure level within the measuring period.

Noise that occurs at night tends to be more disturbing than that occurring during the day, particularly due to the potential for sleep disturbance. To account for this, community noise is usually measured using Day-Night Average Level (L_{dn}) or Community Noise Equivalent Level (CNEL). The L_{dn} is the 24-hour average noise level with a +10 dBA penalty for noise occurring during nighttime (10:00 p.m. to 7:00 a.m.) hours. CNEL is the 24-hour average noise level with a +5 dBA penalty for noise occurring from 7:00 p.m. to 10:00 p.m. and a +10 dBA penalty for noise occurring from 10:00 p.m. to 7:00 a.m. (Caltrans 2013). Noise levels described by L_{dn} and CNEL usually differ by about 1 dBA. The relationship between the peak-hour L_{eq} value and the L_{dn}/CNEL depends on the distribution of traffic during the day, evening, and night. Quiet suburban areas typically have CNEL noise levels in the range of 40 to 50 dBA, while areas near arterial streets are in the 50 to 60-plus CNEL range. Normal conversational levels are in the 60 to 65-dBA L_{eq} range; ambient noise levels greater than 65 dBA L_{eq} can interrupt conversations.[3]

Groundborne Vibration

Groundborne vibration of concern in environmental analysis consists of the oscillatory waves that move from a source through the ground to adjacent structures. The number of cycles per second of oscillation makes up the vibration frequency, described in terms of hertz (Hz). The frequency of a vibrating object describes how rapidly it oscillates. The normal frequency range of most groundborne vibration that can be felt by the human body starts from a low frequency of less than 1 Hz and goes to a high of about 200 Hz.

[2] Federal Highway Administration (FHWA). 2011. Highway Traffic Noise: Analysis and Abatement Guidance (FHWA-HEP-10-025).
[3] Federal Transit Administration (FTA). 2018. Transit Noise and Vibration Impact Assessment Manual. https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf (accessed March 2026).

While people have varying sensitivities to vibrations at different frequencies, in general they are most sensitive to low-frequency vibration. Vibration in buildings, such as from nearby construction activities, may cause windows, items on shelves, and pictures on walls to rattle. Vibration of building components can also take the form of an audible low-frequency rumbling noise, referred to as groundborne noise. Groundborne noise is typically only a problem when the originating vibration spectrum is dominated by frequencies in the upper end of the range (60 to 200 Hz), or when foundations or utilities, such as sewer and water pipes, physically connect the structure and the vibration source (FTA 2018). The primary concern from vibration is it can be intrusive and bothersome to building occupants and vibration-sensitive land uses.

Vibration energy spreads out as it travels through the ground, causing the vibration level to diminish with distance away from the source. High-frequency vibrations diminish much more rapidly than low frequencies, therefore low frequencies tend to dominate the spectrum at large distances from the source.

Vibration amplitudes are usually expressed in peak particle velocity (PPV) or RMS vibration velocity. The PPV and RMS velocity are normally described in inches per second (in/sec). PPV is defined as the maximum instantaneous positive or negative peak of a vibration signal. PPV is often used in monitoring of blasting vibration because it is related to the stresses that are experienced by buildings.[4]

Existing Ambient Noise Environment

The noise environment of the site is relatively quiet compared to much of the City, as the site is not exposed to substantial vehicle noise from nearby roadways. The observed noise sources during a site visit to measure ambient noise levels were wind, birds, occasional aircraft, and mechanical equipment from the adjacent residences (e.g., HVAC noise). Existing noise levels at and near the Project site were documented using two 24-hour (long-term) and six 15-minute (short-term) ambient noise measurements:

- Long-term measurements were collected at the southern property boundary and at the northwestern property boundary.
- Short-term measurements were captured at the center of the Project site, La Coronilla Park, and the southwestern, northeastern, and southeastern corners of the Project site; and the intersection of Meigs Road and La Coronilla Drive.

Noise measurements were conducted using a Piccolo II Type 2 sound-level meter positioned at a height of approximately 5 feet above ground level. The long-term measurements were attached to the perimeter fence, and the meters were calibrated before and after the measurements.

Figure 4.8-1 depicts the measurement locations, Table 4.8-1 describes the short-term measurement results, and Table 4.8-2 describes the long-term measurement results.

The measurements showed that on-site noise levels ranged from low 30s dBA during the nighttime and up to mid-50s dBA during the daytime. Noise levels were generally the same throughout the site. The lowest measured noise level hour during daytime hours was 38.8 dBA. The lowest measured noise level during nighttime hours was 30.0 dBA.

Figure 4.8-1 Ambient Noise Monitoring Locations

dBA = A-weighted decibel; Leq = equivalent noise level; L_{min} = minimum noise level; L_{max} = maximum noise level; CNEL = Community Noise Equivalent Level

Sensitive Receptors

Noise-sensitive receptors are generally uses that are most interfered with by noise. These uses include residences, schools, churches, hotels, as well as some park and open space areas. The Project site is surrounded by adjacent single-family residences. Vibration-sensitive receivers are similar to noise-sensitive receivers and include residences and institutional uses, such as schools and churches.

4.8.2 Regulatory Setting

Federal

There are no federal noise standards that directly regulate environmental noise relevant to the proposed Project. The FTA's 2018 *Transit Noise and Vibration Impact Assessment* guidance document was used to evaluate construction noise and vibration levels resulting from Project construction activities, which are presented in Table 4.8-3.

Table 4.8-3 FTA Construction Noise Criteria

	Construction Noise Limit (dBA L_{eq} 8-hour)	
Receiving Land Use	**Day**	**Night**
Residential	80	70
Commercial	85	85
Industrial	90	90

dBA = A-weighted decibel; Leq = Time weighted equivalent noise level Source: Federal Transit Administration. 2018. Transit Noise and Vibration Impact Assessment. November. Available at: https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf

Table 4.8-4 summarizes the vibration criteria recommended by the FTA for evaluating the potential for architectural damage to buildings. The PPV measures the intensity of ground motion by how fast a particle in the ground moves when vibration passes through it. The higher the PPV, the higher the risk of structural damage to that facility.

Table 4.8-4 Criteria for Vibration Damage Potential

Building Category	PPV (in/sec)
I. Reinforced concrete, steel, or timber (no plaster)	0.5
II. Engineered concrete and masonry (no plaster)	0.3
III. Non-engineered timber and masonry buildings	0.2
IV. Buildings extremely susceptible to vibration damage	0.12

in/sec = inches per second; PPV = peak particle velocity

State

The State of California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards, and provides guidance for local land use compatibility. State law requires each county and city to adopt a General Plan that includes a Noise Element prepared per guidelines adopted by the Governor's Office Land Use and Climate Innovation (formerly the Governor's Office of Planning and Research). The purpose of the Noise Element is to limit the exposure of the community to excessive noise levels. The California Environmental Quality Act requires all known environmental effects of a project be analyzed, including environmental noise impacts.

California General Plan Guidelines

The California General Plan Guidelines, published by the Governor's Office of Land Use and Climate Innovation, indicate acceptable, specific land use types in areas with specific noise exposure. The guidelines also offer adjustment factors that may be used to arrive at noise acceptability standards that reflect the noise control goals of the community, the particular community's sensitivity to noise, and the community's assessment of the relative importance of noise pollution. These guidelines are advisory, and local jurisdictions, including the City of Santa Barbara, have the responsibility to set specific noise standards based on local conditions.

California Noise Control Act of 1973

California Health and Safety Code Sections 46000 through 46080, known as the California Noise Control Act, find that excessive noise is a serious hazard to public health and welfare and that exposure to certain levels of noise can result in physiological, psychological, and economic damage. The act also finds that there is a continuous and increasing bombardment of noise in urban, suburban, and rural areas. The California Noise Control Act declares that the State of California has a responsibility to protect the health and welfare of its citizens by the control, prevention, and abatement of noise. It is the policy of the State to provide an environment for all Californians that is free from noise that jeopardizes their health or welfare.

Local

City of Santa Barbara General Plan

The Environmental Resources Element of the City's General Plan, which incorporates the 1979 Noise Element, is intended to identify sources of noise and provide goals, objectives, and policies that ensure that noise from various sources, including transportation and stationary sources, does not create an unacceptable noise environment. The following policies and implementation actions from the Environmental Resources Element are consistent with the City's overarching goal to ensure that the City is free from excessive noise(City of Santa Barbara 2011):

Policies

- **N3.0:** Existing and potential incompatible noise levels in problem areas should be reduced through land use planning, building, and subdivision code enforcement and other administrative means.
- **N4.0:** Existing and potential incompatible noise levels in problem areas should be reduced through operational or source controls where the City has responsibility for such controls.

Implementation Measures

- **N3.3:** Strictly enforce all existing noise control regulations, including building and subdivision laws.
- **N4.1:** Establish routes for use by heavy trucks away from noise sensitive land uses.
- **N4.6:** Consider noise abatement of stationary sources in cases of excessive noise emissions.

The General Plan Environmental Resources Element contains an additional policy and implementation measures applicable to the Housing Plan (City of Santa Barbara 2011):

Policy

- **ER31: Noise Policies for New Residential Uses.** Take into consideration the surrounding existing and future legal land uses in establishing exterior noise policies for new residential uses.

Implementation Measures

- **ER31.5: Non-Residential Noise Affecting Residential Neighborhoods.** To further General Plan policies for maintaining quiet, high quality neighborhoods, require more detailed noise assessments for proposed special, conditional, and institutional uses with episodic activities and events that may cause noise effects to residential neighborhoods.

City of Santa Barbara Municipal Code

The City's noise ordinance, found in Title 9, Chapter 9.16 of the City of Santa Barbara Municipal Code, regulates short-term or periodic nuisance noise from existing uses and is enforced by the City's Police Department. The ordinance addresses construction noise, use of mechanical equipment, and amplified sound, and identifies general factors considered in determining whether a noise violation has occurred (volume, duration, proximity to sensitive receivers, etc.).

According to Municipal Code Section 9.16.020, no person shall make, continue or cause to be made or continued, or permit or allow to be made or continued, any noise disturbance in such a manner as to be plainly audible by a person of ordinary sensitivity at a distance of 50 feet from the noise source.

As described in Municipal Code Section 9.16.040, it is unlawful for any person, between the hours of 8:00 p.m. of any day and 7:00 a.m. of the following day to construct, demolish, excavate for, alter, or repair any building or structure unless a special permit has been applied for and granted by the Chief Building Official. In granting such special permit, the Chief Building Official shall consider if construction noise in the vicinity of the proposed work site would be less objectionable at night than during daytime because of different population levels or different neighboring activities, if obstruction and interference with traffic, particularly on streets of major importance, would be less objectionable at night than during daytime, if the kind of work to be performed emits noises at such a low level as to not cause significant disturbance in the vicinity of the work site, if the neighborhood of the proposed work site is primarily residential in character wherein sleep could be disturbed, if great economic hardship would occur if the work were spread over a longer time, if the work will abate or prevent hazard to life or property, if the proposed night work is in the general public interest; and he or she shall prescribe such conditions, working times, types of construction equipment to be used, and permissible noise emissions, as they deem to be required in the public interest.

As described in Municipal Code Section 9.16.070, noise from all mechanical equipment buildings, including Heating, Ventilation, and Air Conditioning (HVAC) shall not exceed 53 dBA at the property line of any adjacent parcel used or zoned for residential, public, or semi-public uses.

4.8.3 Impact Analysis

a. Methodology and Significance Thresholds

Methodology

Construction Noise

Short-term noise impacts associated with the proposed Project's construction activities were analyzed based on typical construction equipment noise levels derived from the FHWA's Roadway Construction Noise Model (RCNM). Main construction activities would involve various activities in several areas, including the main construction of demolition and construction of the reservoirs, demolition and construction of the Valve Building, new access road, and off-site improvements to relocate and replace pipelines. For general construction activities, predicted average-daily construction noise levels (in dBA L_{eq}) were calculated assuming the three loudest pieces of equipment operating simultaneously[4] with the equipment operating in approximately the center of each construction area for a typical construction day to the nearest sensitive receptor. Equipment assumptions for each phase were provided by the applicant. Construction noise was estimated using RCNM to estimate the noise levels at a distance of 50 feet, and then using the noise-attenuation rate of 6 dB per doubling of distance from the source to calculate the construction noise levels at nearby receptors.

Construction Vibration

Groundborne vibration levels associated with construction activities were estimated based on the estimates in the FTA's Transit Noise and Vibration Impact Assessment (FTA 2018). Potential vibration levels were identified for the nearby residences that are sensitive to vibration. The greatest vibratory source during construction in the Project vicinity would be potentially from a vibratory roller used during paving phases; outside of paving phases, the greatest vibratory source would be from a dozer. Construction vibration estimates are based on vibration levels reported by the FTA (FTA 2018). Table 4.8-5 shows typical vibration levels for various pieces of construction equipment used in the assessment of construction vibration (FTA 2018).

Table 4.8-5 Typical Vibration Levels From Construction Activities

Equipment	PPV at 25 ft (in/sec)
Vibratory Roller	0.210
Large Bulldozer	0.089
Loaded Trucks	0.076
Static Roller	0.050
Small Bulldozer	0.003

PPV = peak particle velocity; in/sec = inches per second

Source: FTA 2018

[4] On most typical construction sites, up to three pieces of heavy-duty equipment would be operating in a work area simultaneously.

Stationary Noise

Operational noise sources associated with the proposed Project would include pump station pumps and two standby generators. The pumps and generators were analyzed in a Noise Impact Analysis (Steve Rogers Acoustics, LLC 2025; included as Appendix I). The report modeled noise levels with the following equipment assumptions:

- Three vertical turbine pumps, each rated at 60 horsepower and a 7.5 horsepower air compressor.
- The pumps would be enclosed in a pump/valve building that would have 8-inch CMU walls, a sheet metal roof, windows in the east and west walls of single-pane glass, and two hollow metal doors and one large rollup door in the north wall.
- The emergency generators would be a new 250 kW generator serving the pump/valve building and an existing 50 kW generator serving the existing IT building. The generators were assumed to be in sound attenuating enclosures.

Noise specifications for this equipment were inputted into SoundPLAN, a 3D computer noise model. The model included the Project site and its surroundings, including the topography of the area and existing and future buildings. The equipment specifications are shown below in Table 4.8-6.

Table 4.8-6 Modeled Operational Noise Equipment

Equipment	Specification	Number in Model	dBA
60 Horsepower Pumps	GE Induction Motor	3	81.9 Sound Power Level
7.5 Horsepower Air Compressor	Atlas Copco SF6	1	59.0 dBA at 1 meter
250 kW Generator	Caterpillar C09DE60	1	72.4 dBA at 7 meters (23 feet)
50 kW Generator	Caterpillar NAC304P	1	68.6 dBA at 7 meters (23 feet)

The Project would include the installation of a solar system with battery storage. The location of the solar panels would be on top of the reservoir; for analysis purposes, it is analyzed at the eastern edge of the reservoir, which is approximately 250 feet from the residences to the east. The solar battery, its cooling system, and the inverter would be installed likely at the Valve Building at a distance of approximately 75 feet from the nearest residence. The cooling system for the battery energy storage system would generate a maximum noise level of approximately 68 dBA at a distance of one meter.

Traffic Noise

Project construction would generate heavy-duty (e.g., hauling trucks) and passenger vehicle trips for workers during demolition, excavation, and construction. The estimated trips from the Project's Construction Traffic Analysis are shown in Table 4.8-7 (Iteris 2025) and are based on the Project's design at a preliminary phase. It should be noted that truck trips are intended to be reduced as design progresses. Traffic volumes on roadways near the Project that construction traffic would be anticipated to use is shown in Table 4.8-8.

Table 4.8-7 Construction Vehicle Trips

Phase	Heavy Vehicle Daily Trips (One-Way)	Passenger Vehicle Daily Trips (One-Way)	Total Daily Trips (One-Way)
Demolition	20	16	36
Excavation	220	16	236
Construction	28	16	44

Source: Iteris 2025

Table 4.8-8 Local Roadway Volumes with Project Construction Traffic

Roadway Segment	Average Daily Traffic
Meigs Road, near La Coronilla intersection	8,570
La Coronilla Drive, in between Project driveway and Dolores Drive	146
Dolores Drive, in between La Coronilla Drive and Meigs Road	80

Source: Replica. 2026. Replica Annual Average Daily Traffic (AADT) Data. (Accessed January and March 2026).

Note: Vehicle trips are based on the Project's preliminary design and are anticipated to be reduced as the Project progresses towards final design. This table shows a maximum truck trip scenario.

To assess the increase in ambient noise levels, traffic noise increases were determined using the following equation:

$$Traffic\ Noise\ Increase = 10 * LOG\ (\frac{Future\ Traffic\ Volumes}{Existing\ Traffic\ Volumes})$$

Assumptions included a typical vehicle composition of a residential street of 97 percent automobiles, 2 percent medium trucks, and 1 percent heavy trucks, and a typical time of day breakdown of 80 percent of trips occurring in the daytime hours, 5 percent of trips occurring in the evening hours, and 15 percent of trips occurring in the nighttime hours. The Project's hauling trips were modeled as heavy trucks. The speed limits used were 40 miles per hour for Meigs Road and 25 miles per hour for La Coronilla Drive.

Significance Thresholds

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to noise and vibration would be significant if the proposed Project would:

1. Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.
2. Generate excessive groundborne vibration or groundborne noise levels.

As mentioned above, the Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Threshold 3 would have no impact. Thus, the following discussion solely focuses on Thresholds 1 and 2.

Short-Term Construction Noise

The City does not have adopted construction noise standards other than compliance with applicable construction hours (7:00 a.m. to 8:00 p.m.). Therefore, for the purposes of this analysis, the construction noise criteria recommended by the FTA, listed in Table 4.8-3, are used to evaluate

construction noise impacts. In addition, a substantial temporary increase in noise is typically defined as a 10 dBA increase above existing ambient levels. This threshold is based on established acoustical science indicating that a 10 dBA increase is perceived by the average person as a doubling of loudness (Caltrans 2013; FHWA 2011; FTA 2018). In the absence of a City-adopted numeric construction noise threshold, this perceptibility-based criterion is widely used in CEQA practice to evaluate construction noise impacts. The 10 dBA over ambient noise threshold is also applied to construction traffic noise increases. The lowest measured noise level hour during daytime hours at an area representative of the southern and eastern property lines was 38.8 dBA and at an area representative of the northern and western property lines was 42.5 dBA. Therefore, the daytime ambient noise threshold is 48.8 dBA for the southern and eastern property lines and 52.5 dBA for the northern and western property lines. The lowest measured noise level during nighttime hours was 30.0 dBA; therefore, the nighttime ambient noise threshold is 40.0 dBA.

Long-Term Operational Noise Impacts

The City has adopted noise standards in their Municipal Code that regulate on-site operational noise sources in the City. The Project would result in a significant impact if operation would generate noise from on-site sources in excess of standards included in the City's noise ordinance. This includes a 53 dBA limit for noise generated by mechanical equipment.

Groundborne Vibration Impacts

The City does not have adopted construction vibration standards. Therefore, for the purposes of this analysis, the vibration criteria recommended by the FTA for evaluating the potential for architectural damage to buildings, listed in Table 4.8-4, are used to evaluate construction vibration impacts.

b. Project Impacts and Mitigation Measures

Threshold 1:	Would the Project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Noise

Impact NOI-1 SHORT-TERM CONSTRUCTION OF THE PROJECT WOULD TEMPORARILY INCREASE LOCAL NOISE LEVELS THAT WOULD TEMPORARILY EXCEED 10 DBA OVER THE AMBIENT NOISE LEVEL AND THE FTA'S 80 DBA DAYTIME AND 70 DBA NIGHTTIME CONSTRUCTION NOISE THRESHOLDS. IMPLEMENTATION OF MITIGATION MEASURE NOI-1 WOULD REDUCE CONSTRUCTION NOISE LEVELS TO THE EXTENT FEASIBLE; HOWEVER, CONSTRUCTION NOISE LEVELS WOULD STILL EXCEED THRESHOLDS. THEREFORE, IMPACTS WOULD BE SIGNIFICANT AND UNAVOIDABLE.

Daytime Construction

ON-SITE IMPROVEMENTS

Using the construction assumptions and modeling described under *Methodology*, estimated construction noise levels during daytime on-site improvements are provided in Table 4.8-9, Table 4.8-10, Table 4.8-11, and Table 4.8-12 for the residences to the south, west, north, and east,

respectively. As shown in the tables, construction noise from onsite construction activities would exceed the temporary ambient noise threshold by more than +10 dBA from measured ambient noise levels at residences in each direction. Reservoir demolition and construction would not exceed the FTA's 80 dBA (8-hour) threshold due to the additional distance from the reservoir to the residences, while grading and site improvements and utilities activities would exceed the FTA's threshold when work is performed closer to the residences. Although not considered in the model, the reservoir demolition and construction activities would be occurring mostly below ground surface (up to 40 feet); the noise attenuation from the ground that would block the line of sight between the equipment and the nearby residences would provide substantial noise reduction. However, impacts as modeled would be potentially significant.

Table 4.8-9 Modeled Construction Noise Levels – Residences Adjacent to Southern Property Line

Phase	Construction Equipment	Closest Daily Average Distance (feet)[1]	Ambient Daytime Noise Level (dBA)	Modeled Construction Noise Level (dBA L_{eq})	Exceed Ambient Noise Threshold (More than 10 dBA over Ambient)?[2]	Exceed FTA Construction Noise Threshold (80 dBA 8-hour)?
Demolition	Mounted Impact Hammer, Bulldozer, Dump Truck	100	38.8	78.6	**Yes**	No
Grading	Bulldozer, Drill Rig, Excavator	50	38.8	82.1	**Yes**	**Yes**
Reservoir Construction	Concrete Pump Truck, Crane, Concrete Mixer Truck	100	38.8	72.8	**Yes**	No
Site Improvements & Utilities	Compactor, Backhoe, Bulldozer	50	38.8	80.9	**Yes**	**Yes**

[1] For a conservative analysis, it was assumed that grading and site improvements/utilities may take place over the entire parcel.

[2] The ambient noise level at this area was assumed to be 38.8 dBA, which was the lowest measured noise level hour during daytime construction hours listed in Table 4.8-2. Therefore, the ambient threshold used is 38.8 dBA + 10 dBA = 48.8 dBA.

Bold represents threshold exceedances.

Roadway Construction Noise Model (RCNM) outputs are included in Appendix I.

dBA = A-weighted decibel; Leq = equivalent noise level

Table 4.8-10 Modeled Construction Noise Levels – Residences Adjacent to Western Property Line

Phase	Construction Equipment	Closest Daily Average Distance (feet)[1]	Ambient Daytime Noise Level (dBA)	Construction Noise Level (dBA L_{eq})	Exceed Ambient Noise Threshold (More than 10 dBA over Ambient?)[2]	Exceed FTA Construction Noise Threshold (80 dBA 8-hour)?
Demolition	Mounted Impact hammer, Bulldozer, Dump Truck	330	42.5	68.2	**Yes**	No
Grading	Bulldozer, Drill Rig, Excavator	50	42.5	82.1	**Yes**	**Yes**
Reservoir Construction	Concrete Pump Truck, Crane, Concrete Mixer Truck	330	42.5	62.4	**Yes**	No
Site Improvements & Utilities	Compactor, Backhoe, Bulldozer	50	42.5	80.9	**Yes**	**Yes**

[1] For a conservative analysis, it was assumed that grading and site improvements/utilities may take place over the entire parcel.

[2] The ambient noise level at this area was assumed to be 42.5 dBA, which was the lowest measured noise level hour during daytime construction hours listed in Table 4.8-2. Therefore, the ambient threshold used is 42.5 dBA + 10 dBA = 52.5 dBA.

Bold represents threshold exceedances.

Roadway Construction Noise Model (RCNM) outputs are included in Appendix I.

dBA = A-weighted decibel; Leq = equivalent noise level

Phase	Construction Equipment	Closest Daily Average Distance (feet)[1]	Ambient Daytime Noise Level (dBA)	Construction Noise Level (dBA L_{eq})	Exceed Ambient Noise Threshold (More than 10 dBA over Ambient?)[2]	Exceed FTA Construction Noise Threshold (80 dBA 8-hour)?
Demolition	Mounted Impact hammer, Bulldozer, Dump Truck	300	42.5	69.0	**Yes**	No
Grading	Bulldozer, Drill Rig, Excavator	50	42.5	82.1	**Yes**	**Yes**
Reservoir Construction	Concrete Pump Truck, Crane, Concrete Mixer Truck	300	42.5	63.2	**Yes**	No
Site Improvements & Utilities	Compactor, Backhoe, Bulldozer	50	42.5	80.9	**Yes**	**Yes**

[1] For a conservative analysis, it was assumed that grading and site improvements/utilities may take place over the entire parcel.

[2] The ambient noise level at this area was assumed to be 42.5 dBA, which was the lowest measured noise level hour during daytime construction hours listed in Table 4.8-2. Therefore, the ambient threshold used is 42.5 dBA + 10 dBA = 52.5 dBA

Bold represents threshold exceedances.

Roadway Construction Noise Model (RCNM) outputs are included in Appendix I.

dBA = A-weighted decibel; Leq = equivalent noise level

Table 4.8-12 Modeled Construction Noise Levels – Residences Adjacent to Eastern Property Line

Phase	Construction Equipment	Closest Daily Average Distance (feet)[1]	Ambient Daytime Noise Level (dBA)	Construction Noise Level (dBA Leq)	Exceed Ambient Noise Threshold (More than 10 dBA over Ambient?)[2]	Exceed FTA Construction Noise Threshold (80 dBA Leq 8-hour)?
Demolition	Mounted Impact hammer, Bulldozer, Dump Truck	225	38.8	71.5	**Yes**	No
Grading	Bulldozer, Drill Rig, Excavator	50	38.8	82.1	**Yes**	**Yes**
Reservoir Construction	Concrete Pump Truck, Crane, Concrete Mixer Truck	225	38.8	65.7	**Yes**	No
Site Improvements & Utilities	Compactor, Backhoe, Bulldozer	50	38.8	80.9	**Yes**	**Yes**

[1] For a conservative analysis, it was assumed that grading and site improvements/utilities may take place over the entire parcel.

[2] The ambient noise level at this area was assumed to be 38.8 dBA, which was the lowest measured noise level hour during daytime construction hours listed in Table 4.8-2. Therefore, the ambient threshold used is 38.8 dBA + 10 dBA = 48.8 dBA.

Bold represents threshold exceedances.

Roadway Construction Noise Model (RCNM) outputs are included in Appendix I.

dBA = A-weighted decibel; Leq = equivalent noise level

OFF-SITE IMPROVEMENTS

To analyze construction noise from off-site improvements, the improvements were split into three scenarios: La Coronilla Transmission Main, New PRV Station, and Other Pipelines (Dolores Drive Main, La Vista Del Oceano Entry/Exit Pits Main Lining, and Vic Trace Outlet Main). As these activities would occur on residential streets, the equipment may be used at an approximate average distance of 25 feet from residences during a typical construction day. Estimated construction noise levels from off-site improvements are shown in Table 4.8-13. As shown in the tables, modeled construction noise from these activities would exceed the temporary ambient noise threshold of increasing ambient noise by more than 10 dBA (52.5 dBA) and the FTA's 80 dBA Leq (8-hour) threshold at residences on the streets where off-site improvements would occur. Therefore, impacts would be potentially significant.

Table 4.8-13 Modeled Construction Noise Levels – Off-site Improvements

Phase	Construction Equipment	Closest Distance (feet)	Ambient Daytime Noise Level (dBA)	Construction Noise Level (dBA L_{eq})	Exceed Ambient Noise Threshold (More than 10 dBA over Ambient?)[1]	Exceed FTA Daytime Construction Noise Threshold (80 dBA Leq 8-hour)?
La Coronilla Transmission Main Alignment	Backhoe, Generator Paver	25	42.5	91	**Yes**	**Yes**
Dolores PRV Station	Concrete Saw, Backhoe, Concrete mixer truck	25	42.5	90	**Yes**	**Yes**
Other Pipelines	Backhoe, Generator, Paver	25	42.5	90	**Yes**	**Yes**

[1] The ambient noise level at this area was assumed to be 42.5 dBA, which was the lowest measured noise level hour during daytime construction hours listed in Table 4.8-2. Therefore, the ambient threshold used is 42.5 + 10 dBA = 52.5 dBA.

Bold represents threshold exceedances.

Roadway Construction Noise Model (RCNM) outputs are included in Appendix I.

dBA = A-weighted decibel; Leq = equivalent noise level

Nighttime Construction

Nighttime construction may be required to limit the transmission main shutdown timing and for a possible continuous concrete pour of the reservoirs. This may occur at the following locations:

- The La Coronilla transmission main alignment (between the entrance to the site and also the intersection at La Coronilla and Meigs Road). Limited to approximately 48 hours.
- Reservoir site and street routes (Dolores Drive).

Residential uses are located near each of these proposed areas. Nighttime construction activities would be limited to activities only required to accomplish nighttime work (i.e., paving and compacting activities would not occur at night). Nighttime pipeline work, for example, would be limited to pipeline welding and installation. Nighttime reservoir concrete pouring would be limited to the delivery and installation of concrete only. Construction noise levels for these activities are based off the daytime noise level. The potential nighttime construction noise levels at the nearest residences are shown below in Table 4.8-14. As shown in the table, construction noise from these nighttime activities would exceed the temporary ambient noise threshold of more than 10 dBA and the FTA's 70 dBA L_{eq} (8-hour) nighttime threshold. Impacts would be potentially significant.

Table 4.8-14 Modeled Nighttime Construction Noise Levels

Phase	Construction Equipment	Closest Distance (feet)	Ambient Nighttime Noise Level (dBA)	Construction Noise Level (dBA L_{eq})	Exceed Ambient Noise Threshold (More than 10 dBA over Nighttime Ambient?)[1]	Exceed FTA Nighttime Construction Noise Threshold (70 dBA 8-hour)?
La Coronilla Transmission Main Alignment	Generator, Welder torch, Backhoe	25	42.5	85.6	**Yes**	**Yes**
Reservoir Concrete Pour	Concrete pump, Concrete mixer truck, Crane	100	42.5	72.8	**Yes**	**Yes**

[1] The ambient noise level at this area was assumed to be 30.0 dBA, the lowest measured noise level during nighttime hours. Therefore, the threshold used is 30.0 dBA + 10 dBA = 40.0 dBA.

Bold represents threshold exceedances.

Roadway Construction Noise Model (RCNM) outputs are included in Appendix I.

dBA = A-weighted decibel; Leq = equivalent noise level

Mitigation Measures

NOI-1 Construction Noise Reduction

The construction contractor shall prepare and submit a Construction Noise Control Plan to City Environmental Analyst or designee for review and approval prior to issuance of permits authorizing on-site or off-site ground disturbance. The Construction Noise Plan shall be developed with input from the surrounding neighborhood. The Construction Noise Control Plan shall specify the noise reduction measures to be implemented during Project construction to reduce noise levels at residences that surround the Project site to the west, north, east, and south. Measures in the Construction Noise Control Plan may include, but would not be limited to, the following:

- Prior to the start of and for the duration of construction, the contractor shall properly maintain and tune all construction equipment in accordance with the manufacturer's recommendations to minimize noise emissions.
- Prior to use of any construction equipment, the contractor shall fit all equipment with properly operating mufflers, air intake silencers, and engine shrouds no less effective than as originally equipped by the manufacturer.
- Staging and delivery areas shall be located as far as feasible from residences.
- Installation of temporary sound barriers/blankets to break the line of sight to the extent feasible between construction equipment and residences. This may also be achieved during construction when performed in a depression where the earthen walls are able to break the line of sight between equipment and residences.
- To the extent consistent with applicable safety regulations, trucks operating with reverse motions alarms shall be outfitted with SAE J994 Class D or equivalent alarms (ambient-adjusting, or "smart alarms" that automatically adjust the alarm to 5 dBA above the ambient near the operating equipment), or switch off back-up alarms and replace with human spotters in compliance with all safety requirements and laws.

- A construction notification sign shall be posted at the job site, clearly visible to the public, that includes permitted construction days and hours, as well as the telephone numbers of the City of Santa Barbara's and the contractor's authorized representatives that are assigned to respond in the event of a noise complaint. This may also include signage along offsite work corridors when appropriate.

Significance After Mitigation

Implementation of Mitigation Measure NOI-1 would reduce construction noise levels to not exceed 10 dBA over ambient and 80 dBA Leq (8-hour) to the extent feasible. Although several noise measures can be implemented to reduce construction noise levels below the FTA's 80 dBA (8-hour) construction noise threshold, construction noise may still exceed the ambient noise threshold during both daytime and nighttime construction. Due to the nature of the loud noise generated from heavy-duty construction equipment and the reduced efficacy of reduction measures, there may not be enough feasible measures to reduce construction noise levels below the ambient noise increase threshold. Therefore, construction noise impacts would be significant and unavoidable.

Operation Noise

Impact NOI-2 THE PROJECT WOULD INCLUDE MECHANICAL EQUIPMENT THAT WOULD GENERATE OPERATIONAL NOISE LEVELS THAT WOULD NOT EXCEED CITY NOISE STANDARDS AT NEARBY SENSITIVE RECEIVERS. IMPACTS WOULD BE LESS THAN SIGNIFICANT.

Generators and Pumps

The City of Santa Barbara Municipal Code (SBMC) Section 9.16 establishes a noise limit of 53 dBA at the property line for mechanical equipment affecting residential uses. Operational noise sources associated with the proposed Project would include the pump station, associated mechanical equipment, and two standby emergency generators located at the Vic Trace Reservoir parcel. As described in the Project Description, the generators would be installed in sound-attenuating enclosures as part of the Project design. Operational noise levels were evaluated using the SoundPLAN noise model based on equipment specifications and site conditions, including topography and shielding.

Table 4.8-15 presents the expected operational noise levels from the generator and pumps, including sound-attenuating enclosures and standard equipment specifications. As shown, operational noise levels at all modeled receptor locations would comply with the City's 53 dBA noise limit at the property line.

Table 4.8-15 Modeled Operational Noise Levels

Receiver	Address	Modeled Noise Level (dBA L_{eq})	Ambient Noise Level[1] (dBA L_{eq})	Combined Noise Level (dBA L_{eq})[1]	Exceeds 53 dBA Limit?
R1	Backyard of 826 Dolores Dr	37.2	49.0	49.3	No
R2	Backyard of 832 Dolores Dr	35.7	49.0	49.2	No
R3	Backyard of 1633 La Coronilla Dr	39.5	49.0	49.5	No
R4	Front yard of 1624 La Coronilla Dr	38.5	49.0	49.4	No
R5	Backyard of 1617 La Coronilla Dr	49.9	49.0	52.5	No
R6	Backyard of 1607 La Coronilla Dr	44.2	49.0	50.2	No
R7	Backyard of 1601 La Coronilla Dr	38.6	49.0	49.4	No

dBA = A-weighted decibel; Leq = equivalent noise level

[1] Noise levels in decibels (dBA) are measured on a logarithmic scale; therefore, combined sound levels are calculated using logarithmic addition rather than simple arithmetic addition. When two noise sources differ by more than approximately 10 dBA, the combined level is dominated by the higher source.

Source: Appendix I

The Project would be required to comply with the City's noise limit of 53 dBA at the property line for mechanical equipment affecting residential uses. Compliance would be verified during final design and subject to applicable building permit and equipment specification review.

In addition, operation of the standby generators would be limited in duration and frequency and would typically occur during routine testing events and emergency conditions, such as power outages or infrastructure failures. The City's noise ordinance regulates mechanical equipment while recognizing the need for activities required to protect public health, safety, and essential services, including work undertaken during emergencies or to prevent imminent hazards. Temporary noise associated with such emergency operations is an inherent and necessary component of maintaining critical public infrastructure.

The proposed Project would not exceed the City's 53 dBA operational noise standard at nearby sensitive receptors. Operational noise impacts from the generators and pumps would be less than significant.

Solar System and Battery Storage

The Project would include installation of a solar system with battery storage. The location of the solar panels would be on top of the reservoir; for analysis purposes, it is analyzed at the eastern edge of the reservoir, which is approximately 250 feet from the residences to the east. The solar panels would not directly generate noticeable noise and would be well below the City's 53 dBA noise limit. This noise level would add a negligible amount when combined with the noise levels in Table 4.8-15.

The battery storage system, including its cooling system and inverter, would be installed adjacent to the Valve Building at a distance of approximately 75 feet from the nearest residence (R5 in Table 4.8-15) and would generate a noise level of 40.8 dBA. This would be well below the City's 53 dBA noise limit, and when combined with the noise levels in Table 4.8-15, would result in a negligible noise addition. Therefore, operational noise impacts from the equipment would be less than significant.

Mitigation Measures

No mitigation is required.

Off-Site Traffic Noise

Impact NOI-3 PROJECT CONSTRUCTION WOULD GENERATE NEW VEHICLE TRIPS THAT WOULD INCREASE NOISE LEVELS ON NEARBY ROADWAYS THAT WOULD EXCEED TRAFFIC NOISE INCREASE THRESHOLDS. AS NO FEASIBLE MITIGATION EXISTS TO REDUCE THIS IMPACT, IT WOULD BE SIGNIFICANT AND UNAVOIDABLE.

Construction

Project construction would generate temporary trips by workers, vendors, and haul trucks. The transport of workers and materials to and from the construction site would temporarily increase noise levels along roadways in the vicinity of the Project site. Peak daily construction traffic would occur during the grading and excavation phases of the new reservoir when soil export occurs. Construction traffic noise increases on Meigs Road and La Coronilla Road are shown for demolition, grading, and reservoir construction in Table 4.8-16, Table 4.8-17, and Table 4.8-18, respectively.

As shown in the tables, construction traffic noise may result in a more than 10 dBA increase over the existing traffic noise level during the grading and excavation phase when soil export would be completed. This is primarily due to the loud noise levels generated by the heavy trucks used for soil export compared to the low levels of traffic for the residential streets. Therefore, construction traffic noise impacts are potentially significant.

Table 4.8-16 Modeled Increases in Traffic Noise Levels from Construction - Demolition

	Traffic Noise Level (dBA CNEL)			
Roadway Segment	Existing	Existing Plus Demolition Traffic	Noise Level Increase with Demolition Traffic	Significant Impact? [1]
Meigs Road, near La Coronilla intersection	66.9	67.1	0.2	No
La Coronilla Drive, in between Project driveway and Dolores Drive	45.2	53.3	8.1	No
Dolores Drive, in between La Coronilla Drive and Meigs Road	43.0	52.0	9.0	No

[1] A significant impact would occur if Project-related construction traffic increases the existing traffic noise level by 10 dBA or more.
CNEL = Community Noise Equivalent Level (24-hr weighted average noise level) – refer to Table 4.8-2.

Table 4.8-17 Modeled Increases in Traffic Noise Levels from Construction - Grading

	Traffic Noise Level (dBA CNEL)			
Roadway Segment	Existing	Existing Plus Grading Traffic	Noise Level Increase with Grading Traffic	Significant Impact? [1]
Meigs Road, near La Coronilla intersection	66.9	68.5	1.6	No
La Coronilla Drive, in between Project driveway and Dolores Drive	45.2	63.1	17.9	**Yes**
Dolores Drive, in between La Coronilla Drive and Meigs Road	43.0	62.6	19.6	**Yes**

[1] A significant impact would occur if Project-related construction traffic increases the existing traffic noise level by 10 dBA or more.
CNEL = Community Noise Equivalent Level (24-hr weighted average noise level) – refer to Table 4.8-2 (Long-term Ambient Noise Monitoring Results)

Table 4.8-18 Modeled Increases in Traffic Noise Levels from Construction – Reservoir Construction

	Traffic Noise Level (dBA CNEL)			
Roadway Segment	Existing	Existing Plus Reservoir Construction Traffic	Noise Level Increase with Reservoir Construction Traffic	Significant Impact? [1]
Meigs Road, near La Coronilla intersection	66.9	67.1	0.2	No
La Coronilla Drive, in between Project driveway and Dolores Drive	45.2	54.6	9.4	No
Dolores Drive, in between La Coronilla Drive and Meigs Road	43.0	53.4	10.4	**Yes**

[1] A significant impact would occur if Project-related construction traffic increases the existing traffic noise level by 10 dBA or more.

CNEL = Community Noise Equivalent Level (24-hr weighted average noise level) – refer to Table 4.8-2 (Long-term Ambient Noise Monitoring Results)

Operation

Operations and maintenance activities at the reservoir once Project construction activities are completed, would remain the same as existing conditions. Accordingly, Project operation would not result in a net increase in existing noise levels along local roadways as the frequency of staff visits is unchanged. As such, off-site operational traffic noise would not generate a substantial permanent increase in ambient noise levels at noise-sensitive receivers in the vicinity of the Project site in excess of applicable standards, and no impact would occur.

Mitigation Measures

Project construction will export soil through hauling trips that would travel down residential streets to reach Meigs Road. There are no alternative routes that would avoid these residential streets, and using them would be required to exit the area. In addition, construction traffic would follow speed limits and would not result in excess noise over that which is standard for these types of loaded trucks. The Project has been designed to minimize the volume of soil export to the extent feasible, thereby reducing the number of haul trips and associated construction traffic noise. However, no feasible mitigation exists to reduce the Project's potentially significant construction traffic noise impacts.

Significance After Mitigation

Because there is no feasible mitigation to reduce potentially significant impacts resulting from construction traffic noise, this impact would be significant and unavoidable.

Threshold 2:	Would the Project generate excessive groundborne vibration or groundborne noise levels?

Impact NOI-4 PROJECT CONSTRUCTION WOULD RESULT IN GROUNDBORNE VIBRATION IN THE PROJECT SITE VICINITY THAT MAY EXPOSE NEARBY STRUCTURES TO DAMAGING VIBRATION LEVELS, WHICH WOULD BE A POTENTIALLY SIGNIFICANT IMPACT. THIS IMPACT WOULD BE MITIGATED TO LESS THAN SIGNIFICANT WITH IMPLEMENTATION OF MITIGATION MEASURE NOI-2.

Construction

ON-SITE

Construction activities known to generate excessive ground-borne vibration would not be used for Project construction. The greatest anticipated source of vibration during general Project construction activities would potentially be from a roller and a dozer. A dozer would be a proxy for other typical heavy-duty construction equipment, such as an excavator. It is conservatively assumed that the roller used by the Project may be a vibratory roller.

Across the various construction areas of the Project equipment may be used within 25 feet of the nearest residential structures. A vibratory roller would create a vibration level of approximately 0.210 PPV in/sec at a distance of 25 feet and a dozer would create a vibration level of 0.089 PPV in/sec at a distance of 25 feet (FTA 2018). Therefore, use of a vibratory roller may exceed[5] the FTA's 0.2 PPV in/sec threshold for non-engineered timber buildings, which is representative of the older residential structures within the area. Impacts from use of a vibratory roller would be potentially significant. However, use of a dozer and other low vibratory construction equipment would not exceed the threshold, and impacts from these pieces of equipment would be less than significant.

Construction vibration would also occur on local roadways from loaded trucks used to haul materials from and to the construction site. A loaded truck would create a vibration level of 0.076 PPV in/sec at a distance of 25 feet (FTA 2018). These trucks would be driven within 25 feet of the nearest residential structures on the local residential streets such as La Coronilla Drive and Dolores Drive; a vibration level of 0.076 PPV in/sec would not exceed the FTA's 0.2 PPV in/sec threshold for non-engineered timber buildings, which is representative of the older residential structures within the area. In addition, according to the FTA's Transit Noise and Vibration Impact Assessment Manual, vibration from trucks along roadways is unlikely to be perceptible, even if the receptor is close to a major roadway (FTA 2018). Therefore, temporary vibration impacts associated with the loaded trucks to off-site residential structures would be less than significant.

Operation

Operational activities known to generate excessive ground-borne vibration include projects involving railroads and subways. The proposed Project would not involve substantial vibration sources associated with operation such as this because operation of a reservoir and associated facilities does not include these uses. Therefore, the proposed Project's operational groundborne vibration and noise impacts would be less than significant.

[5] A vibratory roller would exceed the FTA's threshold if used within 26 feet of a nearby residential structure.

Mitigation Measures

NOI-2 Construction Vibration Reduction Measures

Prior to the issuance of construction permits, the City of Santa Barbara shall verify that the construction plans include the following requirements:

- For construction activities within 25 feet of nearby residential structures, alternative low-vibratory equipment (e.g., static roller) shall be used.

Significance After Mitigation

With Mitigation Measure NOI-2, equipment, such as a static roller, would be used in lieu of a vibratory roller if the equipment needs to be operated within 25 feet of a nearby residence. Use of a static roller would generate vibration levels of approximately 0.09 in/sec PPV at a distance of 15 feet (McIver 2012), which is well below the FTA's threshold of 0.2 PPV in/sec for non-engineered timber buildings. Therefore, with mitigation, Project construction vibration impacts would be less than significant.

4.8.4 Cumulative Impacts

Construction noise is localized and rapidly attenuates within an urban environment. Accordingly, the cumulative impact analysis for noise considers impacts that would occur from the construction and operation of cumulative projects near the Project site. The general approach to cumulative impact analysis used in this EIR is discussed in Section 3, *Environmental Setting*.

Some construction activities from the cumulative projects may occur within several hundred feet of the nearest sensitive receptors and therefore may expose these receivers to construction noise simultaneously with construction noise generated from the Project site. Theoretically this could result in increased noise exposure to the sensitive receivers from combined noise levels; however, real world conditions would result in less of a cumulative effect through noise direction, angles, attenuation, and dispersion. In addition, cumulative projects would also be required to comply with applicable City standards.

The Project would implement Mitigation Measure NOI-1 to reduce Project construction noise levels to comply with construction noise thresholds; however, due to the increase in ambient noise levels from construction, these impacts would be significant and unavoidable on the Project level. Therefore, since cumulative construction noise may occur from the Project and simultaneous construction of another project within several hundred feet and since the Project would not be able to mitigate construction noise below significant, a substantial cumulative construction noise impact would occur. As the Project would be implementing feasible mitigation measures through Mitigation Measure NOI-1, there is no further mitigation to reduce this impact.

Similar to construction noise, construction vibration is localized and rapidly attenuates within an urban environment. Because cumulative projects would approach the nearest sensitive receptor from a different direction than the proposed Project, their vibration would travel farther before it could theoretically combine with the Project's vibration. As those projects would be constructed at a similar or further distance from the nearest sensitive receiver, their vibration levels would be anticipated to be well below vibration limits as well. In addition, the Project would implement Mitigation Measure NOI-2 to reduce vibration impacts to less than significant. Therefore, the combined vibration level from cumulative projects would still be well below vibration limits, and no cumulative construction vibration impact would occur.

Some cumulative projects would include similar operational noise sources to the proposed Project (e.g., mechanical equipment noise). Operational noise from these sources is localized and rapidly attenuates due to the effects of distance, intervening structures, and topography that block the line of sight. In addition, other ambient noise sources in closer proximity to the receptors would dominate the soundscape, effectively masking Project-related noise leading to a cumulative increase. Therefore, the ability of on-site Project noise to combine with noise from off-site sources to create a substantial increase in noise levels would not occur.

The Project would create a temporary significant traffic noise impact during construction due to soil export hauling trips. This impact cannot be mitigated to less than significant; therefore, the project's construction traffic noise increase would be cumulatively considerable.

4.9 Transportation

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to transportation would be significant if the proposed Project would:

1. Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.
2. Conflict or be inconsistent with *CEQA Guidelines* Section15064.3, subdivision (b) (Criteria for Analyzing Transportation Impacts).
3. Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).
4. Result in inadequate emergency access.

The Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 2, 3, and 4 would be less than significant or have no impact. These impacts are discussed in Initial Study Environmental Checklist Section 17, Transportation (Appendix A). Thus, the following discussion solely focuses on Threshold 1.

4.9.1 Environmental Setting

The Project site encompasses the Vic Trace Reservoir parcel and various water infrastructure improvements in the Alta Mesa neighborhood in the city of Santa Barbara, California. The Project site includes La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road, all of which are local or collector streets.

City of Santa Barbara

Santa Barbara is a coastal city in south-central California with a population of 87,291,[1] situated between the Pacific Ocean and the Santa Ynez Mountains and connected regionally by United States Highway 101 (U.S. 101) as well as State Routes 192 and 154. The city's transportation system also includes access to the Union Pacific Railroad corridor, which accommodates both passenger and freight service. Active transportation is a major component of local mobility, with extensive bicycle facilities and a pedestrian-friendly design that is especially prominent along State Street's paseo network and the waterfront.

Public Transit Services

Transit service in the vicinity of the Project site is provided by Santa Barbara Metropolitan Transit District. Line 5 (Mesa/La Cumbre) and Line 4 (Mesa/Santa Barbara City College) operate along Cliff Drive and Meigs Road, with the nearest stops located at Meigs Road and La Coronilla Drive, Meigs Road and Red Rose Way, and Cliff Drive and Meigs Road (Santa Barbara Metropolitan Transit District 2025). These routes provide access to Santa Barbara City College, downtown Santa Barbara, and the La Cumbre area. The nearest railroad station is the Santa Barbara Amtrak Station, located in downtown Santa Barbara, approximately 1.4 miles northeast of the Project site.

[1] United States Census. 2024. Santa Barbara City, California. https://www.census.gov/quickfacts/fact/table/santabarbaracitycalifornia/PST045224 (accessed January 2026).

Bicycle and Pedestrian Facilities

Pedestrian sidewalks occur along both sides of La Coronilla Drive, Dolores Drive, Ricardo Avenue, and Meigs Road. A Class II[2] bicycle facility is located along Meigs Road and occurs within the Project site.[3] These pedestrian facilities provide continuous walking access throughout the residential Alta Mesa neighborhood and link directly to adjacent homes, utilities, and roadway connections within the Project area. Although La Vista Del Oceano Drive does not contain sidewalks, it is a street serving only a small number of residences and supports minimal pedestrian activity. Sidewalks along La Coronilla Drive, Dolores Drive, Ricardo Avenue, and Meigs Road connect the Project site to nearby neighborhood corridors, including Meigs Road, which provides pedestrian access toward Cliff Drive and other destinations within the Mesa neighborhood. The existing pedestrian facilities and the on-street bicycle facility along Meigs Road contribute to local multimodal connectivity, allowing travel between Project-area streets, the surrounding neighborhood, and major nearby corridors such as Cliff Drive.

Roadway Facilities

The Project site is served by a network of residential roadways, including La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano Drive, and Meigs Road, which provide local access within the Alta Mesa neighborhood. La Coronilla Drive provides the primary access to the Vic Trace Reservoir parcel via an existing 20-foot-wide easement and connects to the one-lane paved access road leading up Lavigia Hill. Dolores Drive and Ricardo Avenue support local circulation and contain existing water mains proposed for replacement or rehabilitation, while La Vista Del Oceano includes the location of the existing pressure reducing valve (PRV) station to be abandoned and a temporary exit pit for pipeline relining activities. Meigs Road functions as a higher-order connector between these local streets and major corridors, including Carrillo Street and Cliff Drive, and serves as one of the primary construction access routes. For context, local streets in this area provide direct access to adjacent residences and accommodate low-volume neighborhood travel, whereas collector roadways, such as Meigs Road, facilitate circulation between local streets and regional routes including U.S. 101.

4.9.2 Regulatory Setting

a. State Regulations

California Department of Transportation

The California Department of Transportation (Caltrans) is the responsible agency for implementing state-level policies and standards for highway facilities under State jurisdiction. Caltrans issues transportation permits to operate or move a vehicle, combination of vehicles, or special mobile equipment of a size or weight of vehicle or load exceeding the maximum limitations specified in the California Vehicle Code. Construction activities for the proposed Project would require hauling materials along U.S. 101, and the City would obtain Caltrans transportation permits for any oversize or overweight loads. These permits would result in compliance with route restrictions, structural load limits, and safety requirements such as travel-time restrictions and escort vehicles.

[2] A Class II bicycle facility is a striped on-street bike lane intended to give cyclists a predictable, dedicated space along a roadway without full physical separation.
[3] Santa Barbara, City of. 2016. Bicycle Master Plan. https://santabarbaraca.gov/sites/default/files/documents/Public%20Works/Bicycle%20Master%20Plan/2016%20Bicycle%20Master%20Plan%20-%20Introduction.pdf (accessed January 2026).

California Manual on Uniform Traffic Control Devices

The regulation of traffic control devices and traffic management during construction activities in California is governed by the California Manual on Uniform Traffic Control Devices (CA MUTCD), adopted by Caltrans pursuant to California Vehicle Code Section 21400. Effective January 18, 2026, Caltrans issued the CA MUTCD 2026, which replaces the CA MUTCD 2014 (Revision 9) and is the legally enforceable statewide standard for the design, placement, and operation of all official traffic control devices on public roadways and facilities in California. The CA MUTCD 2026 is in substantial conformance with the Federal Highway Administration's 2023 Edition of the National MUTCD and was adopted following review and recommendation by the California Traffic Control Devices Committee. Part 6 (Temporary Traffic Control) of the CA MUTCD 2026 establishes mandatory standards and guidance applicable to construction-related activities that affect public roadways, including requirements for temporary traffic control devices, signage, lane closures, flagging operations, pedestrian and bicycle accommodations, and Traffic Control Plans, where appropriate.

b. Local Regulations

Connected 2050: Regional Transportation Plan & Sustainable Communities Strategy

The Regional Transportation Plan and Sustainable Communities Strategy, adopted in August 2025, is a long-range planning document for the Santa Barbara County Association of Governments' regional transportation system. The Regional Transportation Plan analyzes the transportation needs of the region into the future and identifies project priorities in order to improve the transportation system. The Sustainable Communities Strategy, as required by Senate Bill 375, outlines how the region will integrate land use and transportation planning to reduce greenhouse gas emissions from passenger vehicles. It establishes a coordinated approach to where people live, work, and play, and how they travel between those locations by aligning growth patterns with transportation investments. The plan considers demographic trends, housing needs, and economic factors, and presents a vision for balancing land use and mobility to meet regional goals while complying with state climate targets.[4]

The following Connected 2050 goals and policies are relevant to the proposed Project.

Goal 2: Mobility & System Reliability: Ensure the reliability of travel by all modes.

- **Policy 2.1: Access, Circulation, and Congestion.** Relevant elements include enhancing access and circulation throughout the region and reducing congestion. These support maintaining safe and functional roadway access to the Vic Trace Reservoir and surrounding residential streets during construction and operations.
- **Policy 2.2: System Maintenance, Expansion, and Efficiency.** Key applicable provisions include prioritizing maintenance and enhancement of the existing roadway system and increasing operational efficiency. The Project's reliance on existing roadways for construction access and long-term operations is consistent with this policy's focus on maintenance and efficiency.

[4] Santa Barbara County Association of Governments (SBCAG). 2025. Connected 2050: Regional Transportation Plan and Sustainable Communities Strategy. https://www.sbcag.org/wp-content/uploads/2025/08/Connected2050_August2025.pdf (accessed January 2026).

City of Santa Barbara Circulation Element

The City of Santa Barbara General Plan Circulation Element describes the circulation system for the safe and efficient movement of people, goods, and services within the City's existing and proposed land use patterns.[5] The following policy from Santa Barbara's General Plan Circulation Element is relevant to the Project:

- **Policy C8: Emergency Routes.** It shall be a high priority to keep all emergency evacuation, response and truck routes free of physical restrictions that may reduce evacuation/response times.

Santa Barbara Pedestrian Master Plan

The City of Santa Barbara Pedestrian Master Plan establishes citywide policies, design standards, and infrastructure priorities intended to enhance pedestrian safety, accessibility, and connectivity.[6] The Pedestrian Master Plan identifies pedestrian-priority zones, evaluates sidewalk conditions, and outlines improvements such as enhanced crosswalks, curb extensions, Americans with Disabilities Act accessibility upgrades, and traffic-calming measures. Its goals include increasing walkability, reducing pedestrian-vehicle conflicts, and improving access to key community destinations such as schools, parks, transit stops, and commercial areas. The Pedestrian Master Plan supports the City's General Plan Circulation Element policies by promoting pedestrian-oriented transportation and reducing reliance on motor vehicles.[7] Compliance with the Pedestrian Master Plan ensures new projects maintain safe pedestrian circulation during and after construction and avoid actions that would remove or degrade established pedestrian facilities.

Santa Barbara Bicycle Master Plan

The City of Santa Barbara Bicycle Master Plan provides a comprehensive framework for improving bicyclist safety, comfort, and network connectivity throughout the City.[8] The Bicycle Master Plan inventories existing bikeways, identifies gaps in the bicycle network, and prioritizes new Class I, II, and III bicycle facilities to create a cohesive, low-stress bicycle system. It outlines design guidance for bikeway improvements, intersection treatments, signage, and maintenance practices that support increased bicycle use and multimodal mobility. As part of the City's Complete Streets policy, the Bicycle Master Plan seeks to reduce collisions, encourage mode shift, and improve access between residential neighborhoods, commercial corridors, schools, and transit. Projects subject to the Bicycle Master Plan must ensure construction activities do not permanently remove or obstruct existing bike facilities, and temporary detours or protective measures must be implemented to maintain safe bicyclist travel during construction.

[5] Santa Barbara, City of. 2011b. Circulation Element. https://santabarbaraca.gov/sites/default/files/documents/General%20Plan/General%20Plan/Circulation%20Element%2A%20%28includes%20Scenic%20Highways%29.pdf (accessed January 2026).
[6] Santa Barbara, City of. 2006. Pedestrian Master Plan. https://santabarbaraca.gov/sites/default/files/documents/Public%20Works/Pedestrian%20Master%20Plan/Chapter%2004%3A%20Goals%20and%20Policies.pdf (accessed January 2026).

4.9.3 Impact Analysis

a. Significance Criteria and Methodology

Significance Criteria

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to transportation would be significant if the proposed Project would:

1. Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.

As mentioned above, the Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 2, 3, and 4 would be less than significant or have no impact. These impacts are discussed in Initial Study Environmental Checklist Section 17, Transportation (Appendix A). Thus, the following discussion solely focuses on Threshold 1.

Methodology

Potential transportation impacts related to Project-generated traffic that would potentially conflict with a program, plan, ordinance, or policy addressing the circulation system were evaluated for both construction and operation of the Project. Impacts were evaluated in light of existing roadway conditions, anticipated Project-related traffic generated during construction and operation and maintenance activities, and the Project's potential to temporarily affect transportation facilities through lane closures.

b. Project Impacts and Mitigation Measures

Threshold 1:	Would the project conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Impact TRA-1 PROJECT CONSTRUCTION WOULD POTENTIALLY CONFLICT WITH A PROGRAM, PLAN, ORDINANCE OR POLICY ADDRESSING THE CIRCULATION SYSTEM, INCLUDING TRANSIT, ROADWAY, BICYCLE AND PEDESTRIAN FACILITIES. HOWEVER, THE PROJECT WOULD INCLUDE MITIGATION MEASURE TRA-1, WHICH WOULD REQUIRE A DETAILED TRAFFIC CONTROL PLAN. FOLLOWING IMPLEMENTATION OF THIS MITIGATION MEASURE, IMPACTS WOULD BE LESS THAN SIGNIFICANT.

Construction

Project construction would temporarily affect circulation on roadways within the Project site, including La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road. As described in Chapter 2, *Project Description*, Section 2.7, *Project Construction*, construction would involve open-cut trenching, temporary pipeline entry/exit pits, pressure reducing valve station excavation, and periodic lane closures necessary for equipment access and worker safety. See Table 4.9-1 for estimated truck traffic caused by Project construction.

Table 4.9-1 Project Directional (Inbound/Outbound) Trip Distribution by Project Phase

Mode	Phase	Duration	Total Trips (Two-Way)	Daily Trips (Two-Way)	AM Peak Hour		PM Peak Hour	
					Inbound	Outbound	Inbound	Outbound
Heavy Vehicle	Demolition	5 Weeks	224	10	2	1	0	2
	Excavation	4 Months	9,230	110	22	11	0	22
	Construction	100 Days	1,440	14	3	2	0	3
Peak Hour % vs Daily- Heavy Vehicle					**20%**	**10%**	**0%**	**20%**
Auto	Workers	200 Days	1,600	8	8	0	0	8
Peak Hour % vs Daily - Worker					**100%**	**0%**	**0%**	**100%**

Source: Appendix J Traffic Study

All construction-related trips would occur during permitted City working hours (7:00 a.m. to 8:00 p.m.), consistent with SBMC Chapter 9.16 (see Section 4.8, *Noise*), unless after hours work is permitted and approved in advance. Limited nighttime construction may be required to limit the transmission main shutdown timing and for a potential continuous reservoir concrete pour. Nighttime work may specifically occur at the following locations:

- The La Coronilla transmission main alignment (between the entrance to the site and also the intersection at La Coronilla and Meigs Road). Limited to approximately 48 hours.
- Reservoir site and street routes (Dolores Drive).

Nighttime construction activities would be limited to activities only required to accomplish nighttime work (i.e., paving and compacting activities would not occur at night) and restricted to these discrete locations and durations. Nighttime pipeline work, for example, would be limited to pipeline welding and installation. Nighttime reservoir concrete pouring would be limited to the delivery and installation of concrete only. Nighttime construction-related vehicle trips would be limited in number and frequency and would primarily consist of essential worker and material delivery vehicles consistent with the assumptions analyzed in Section 4.8, *Noise*. Haul routes would likely proceed northwest from the Project site along Dolores Drive, with a right turn on Meigs Road and northeast towards U.S. 101 North or via Cliff Drive to Las Positas towards U.S. 101 North. These routes consist of established public roadways suitable for accommodating construction vehicles. Coordination with Caltrans and adherence to City of Santa Barbara Encroachment Permit conditions would minimize potential traffic and safety impacts during construction.

Project personnel truck trips to construction offices at 1633 La Coronilla Drive would occur during permitted working hours (7:00 a.m. to 8:00 p.m.) with rare exceptions made for necessary management of after-hours work required by the Project, approved and noticed in advance. Personnel truck trip routes would likely proceed along La Coronilla Drive and/or Dolores Drive from Meigs Road.

Pipeline installation, roadway trenching, and pressure reducing valve vault construction would require temporary lane closures, traffic shifts, and possible flagger controls, particularly at the La Coronilla Drive/Meigs Road intersection, the Dolores Drive/Meigs Road intersection, and the Ricardo Avenue/La Vista Del Oceano intersection. The City would implement a traffic management plan consistent with the City's applicable Circulation Element goals and policies, as well as with the

City's Master Pedestrian Plan and Master Bicycle Plan,[9,10] ensuring safe travel for motorists, bicyclists, pedestrians, and emergency responders. Temporary lane closures may occur during construction, but pedestrian and bicycle access would be maintained through standard traffic control measures. Access to all residences would be maintained at all times, with short-duration driveway disruptions minimized and communicated through neighborhood notifications. Construction activities would occur within the existing public right-of-way and would not involve permanent modifications to the roadway network. Temporary construction access may occur through La Coronilla Park during park construction activities only. All park areas would be restored after construction, and these temporary uses would not impede pedestrian access beyond the short construction window.

Because the Project includes no permanent changes to roadway configuration, no long-term removal of transit stops, and no permanent closure of bicycle or pedestrian routes, construction activities would not conflict with the City of Santa Barbara General Plan Circulation Element, the Pedestrian Master Plan, Bicycle Master Plan, SBCAG Connected 2050 or any adopted multimodal transportation policies.[9, 10, 11, 11] However, due to the anticipated temporary lane closures, the proposed Project would result in a short-term impact to the existing circulation system, which could conflict with General Plan Circulation Element Policy C8. This impact would be potentially significant.

Implementation of Mitigation Measure TRA-1 would reduce impacts to a less-than-significant level.

Operation

All public roadway rights-of-way affected during construction would be restored upon completion following all relevant requirements for damage repair and pavement restoration. The proposed pipelines would be installed underground; thus, Project components would not physically interfere with the circulation system during Project operation. Project-generated traffic during operation would be limited to personnel-related vehicle trips to inspect the pipelines and reservoir and IT/communications facilities, similar to existing conditions. As a result, operational transportation impacts would not conflict with a program, plan, ordinance or policy addressing the circulation system and would be less than significant.

Mitigation Measures

TRA-1 Enhanced Traffic Control Plan

In addition to the minimum requirements established by Part 6 (Temporary Traffic Control) of the CA MUTCD the City shall incorporate the following requirements:

- The contractor shall maintain access to all driveways, residences, and businesses at all times unless otherwise specified. If a temporary closure of a driveway or access point is necessary, the contractor shall provide written notification to all affected residences and businesses at least 72 hours in advance.

[9] Santa Barbara, City of. 2006. Pedestrian Master Plan. https://santabarbaraca.gov/sites/default/files/documents/Public%20Works/Pedestrian%20Master%20Plan/Chapter%2004%3A%20Goals%20and%20Policies.pdf (accessed January 2026).
[10] Santa Barbara, City of. 2016. Bicycle Master Plan. https://santabarbaraca.gov/sites/default/files/documents/Public%20Works/Bicycle%20Master%20Plan/2016%20Bicycle%20Master%20Plan%20-%20Introduction.pdf (accessed January 2026).
[11] Santa Barbara County Association of Governments (SBCAG). 2025. Connected 2050: Regional Transportation Plan and Sustainable Communities Strategy. https://www.sbcag.org/wp-content/uploads/2025/08/Connected2050_August2025.pdf (accessed January 2026).

- The contractor shall provide a minimum of 72 hours' advance notice to law enforcement, fire/emergency services public transit agencies, and school transportation providers prior to the start of construction. The contractor shall coordinate specifically with Santa Barbara Unified School District regarding bus pick-up and drop-off locations within the neighborhood.
- When a detour is required on Meigs Road, La Coronilla Drive, or Dolores Drive, portable message boards shall be placed on Meigs Road, north of La Coronilla Drive and south of Dolores Drive, at least 24 hours before any street closure.
- The contractor shall identify and maintain a designated detour route at all times.
- A minimum of one-lane traffic flow shall be maintained at all times on Ricardo Avenue.

Significance After Mitigation

Implementation of Mitigation Measure TRA-1, *Enhanced Traffic Control Plan*, would minimize temporary construction-related traffic impacts by ensuring that access is maintained, detours are clearly communicated, and vehicle movements are managed to avoid peak-hour congestion. With these measures in place, construction activities would not conflict with the City of Santa Barbara General Plan Circulation Element, and impacts would be less than significant with mitigation.

4.9.4 Cumulative Impacts

The geographic scope for cumulative transportation impacts is the local circulation network serving the Alta Mesa neighborhood and its regional connections, including La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, Meigs Road, Cliff Drive, and connecting routes to U.S. 101. This scope is appropriate because it encompasses the roadways that would experience the majority of construction truck trips, worker trips, and temporary lane closures associated with the proposed Project, as well as any cumulative development that may affect the same transportation network. Past, present, and reasonably foreseeable development in the broader West Side and Mesa areas may require temporary lane closures or truck hauling along Meigs Road, Cliff Drive, and adjacent streets. Several cumulative projects are located within the Alta Mesa neighborhood, including along Dolores Drive, La Coronilla Drive, La Vista Del Oceano, and Meigs Road; thus, construction activities elsewhere in the vicinity could overlap with Project construction. Overlapping construction truck activity, lane closures, or equipment staging associated with regional infrastructure improvements could incrementally increase congestion and temporarily affect bicycle and pedestrian facilities, resulting in a significant cumulative transportation impact.

Project construction would generate temporary truck activity, including approximately 110 daily haul truck trips during excavation/grading, 8 to 10 daily demolition haul trips during demolition, and approximately 14 daily concrete delivery trips during reservoir construction. Project trucks would travel via Dolores Drive to Meigs Road and then toward U.S. 101 via Meigs Road, West Carrillo Street, or Cliff Drive. Temporary lane reductions would also occur along La Coronilla Drive, Dolores Drive, Ricardo Avenue, and La Vista Del Oceano, and at intersections with Meigs Road, to accommodate pipeline construction, vault installation, and equipment access. These activities could incrementally contribute to circulation delays or localized queuing if they coincide with regional construction activity.

However, the Project would implement comprehensive traffic control measures to reduce construction-related transportation impacts, including advance notification to nearby residents and public agencies, construction phasing to maintain access, portable message boards on Meigs Road prior to any closures, and flagger-controlled traffic near active work areas. Because the off-site

pipeline alignments are linear, only one roadway segment would be subject to lane reduction at a time, and closures would be of short duration. Mitigation Measure TRA-1, *Enhanced Traffic Control Plan*, would further minimize impacts by maintaining multimodal access, coordinating with emergency responders and transit providers, and distributing advance closure and detour information.

Although cumulative transportation impacts from overlapping regional construction activities would be significant, the proposed Project's contribution would not be cumulatively considerable. With implementation of Mitigation Measure TRA-1 and City-required traffic control measures, Project construction would not substantially increase congestion levels, constrain multimodal travel, or result in permanent changes to circulation patterns. All Project-related transportation effects would be temporary, intermittent, and reduced through mandatory traffic management practices. Accordingly, the proposed Project would not result in a considerable contribution to significant cumulative transportation impacts.

This page intentionally left blank.

4.10 Utilities and Service Systems

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to utilities and service systems would be significant if the proposed Project would:

1. Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction of which could cause significant environmental effects.
2. Have insufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.
3. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments.
4. Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.
5. Not comply with federal, state, and local management and reduction statutes and regulations related to solid waste.

The Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 1, 2, and 3 would be less than significant or have no impact. These impacts are discussed in Initial Study Environmental Checklist Section 19, *Utilities and Service Systems* (Appendix A). Thus, the following discussion solely focuses on Thresholds 4 and 5.

4.10.1 Setting

The environmental setting for utilities and service systems focuses on existing solid waste collection, processing, and disposal systems, including the availability of permitted facilities, existing landfill capacity, and the infrastructure and programs that support solid waste management within the project area.

Solid Waste

Solid waste management for the Project area is provided by Marborg Industries, which the City of Santa Barbara contracts as a private company to collect, transport, and dispose of solid waste. Collected waste is ultimately conveyed to the Tajiguas Landfill located in unincorporated Santa Barbara County at 14470 Calle Real, Goleta, CA 93117.[1] Tajiguas Landfill can process up to 9,000 tons of waste per week and has a remaining capacity of roughly 7,345,787 cubic yards through the year 2038.

[1] Marborg Industries. 2026. Welcome, City of Santa Barbara Customers. https://marborg.com/city-of-santa-barbara-info/ (accessed January 2026).

4.10.2 Regulatory Setting

a. Federal Regulations

Resource Conservation and Recovery Act

The Resource Conservation and Recovery Act (RCRA), which amends the Solid Waste Disposal Act of 1965, was enacted in 1976 to address municipal and industrial solid waste generated nationwide. The act gives United States Environmental Protection Agency (USEPA), the federal agency responsible for protecting human health and the environment, the authority to control hazardous waste from "cradle to grave," which includes the generation, transportation, treatment, storage, and disposal of hazardous waste. The RCRA also sets forth a framework for the management of hazardous solid wastes. The federal Hazardous and Solid Waste Amendments to the RCRA were adopted in 1984 and were aimed at waste minimization and phasing out land disposal of hazardous waste, as well as providing guidance for corrective action of releases.

a. State Regulations

Assembly Bill 939

The California Integrated Waste Management Act of 1989 (AB 939; Public Resources Code Sections 41780 and 42900–42927) established the statewide requirement for all cities and counties to reduce the volume of solid waste sent to landfills by 50 percent by the year 2000 and to maintain a diversion rate of at least 50 percent in each subsequent year. The act promotes reduction, recycling, and reuse of solid waste to the maximum extent feasible. In 2008, Senate Bill (SB) 1016 revised the method for evaluating compliance by replacing the diversion-rate calculation with a per-capita disposal rate equivalent, using City population and employment data to determine annual disposal targets.

California Green Building Standards Code

The California Green Building Standards code (CALGreen) sets mandatory standards for energy efficiency, water conservation, material resource efficiency, construction waste reduction, and indoor environmental quality for new and renovated buildings. It requires at least 65 percent diversion of non-hazardous construction and demolition debris, as well as preparation and implementation of a Construction Waste Management Plan.

Senate Bill 1016

SB 1016 requires that the 50 percent solid waste diversion requirement established by AB 939 (the California Integrated Waste Management Act) be expressed in pounds per person per day. SB 1016 changed the California Department of Resource Recycling and Recovery (CalRecycle) review process for each municipality's integrated waste management plan. After an initial determination of diversion requirements in 2006 and establishment of diversion rates for subsequent calendar years, CalRecycle now reviews a jurisdiction's diversion rate compliance in accordance with a specified schedule. Since 2018, CalRecycle is required to review a jurisdiction's source reduction and recycling element and hazardous waste element once every two years.

Senate Bill 1383

The Short-Lived Climate Pollutant Reduction Act of 2016 (SB 1383; Public Resources Code Sections 42649.8–42649.87) establishes statewide targets to reduce emissions of short-lived climate pollutants by reducing the disposal of organic waste in landfills. SB 1383 requires California to reduce the statewide disposal of organic waste by 75 percent below 2014 levels by 2025 and to recover at least 20 percent of edible food that would otherwise be disposed of for human consumption. The law requires cities and counties to implement comprehensive organic waste reduction programs, including mandatory organic waste collection, contamination monitoring, enforcement, recordkeeping, and procurement of recovered organic waste products. Regulations adopted by the California Department of Resources Recycling and Recovery (CalRecycle) became effective January 1, 2022, with phased compliance and enforcement responsibilities assigned to local jurisdictions. SB 1383 expands upon and strengthens existing solid waste diversion requirements by establishing enforceable mandates for organic waste recycling and edible food recovery applicable to residents, businesses, and local governments statewide.

b. Local Regulations

City of Santa Barbara General Plan

The Environmental Resources Element of the City's General Plan identifies the City's goals for maintaining existing environmental resources, while assuring an adequate supply to meet future needs. Policies within the General Plan pertaining to solid waste applicable to the Project include the following:[2]

- **Policy ER22: Solid Waste Management Programs**. Continue and expand City recycling programs for resource reduction, reuse, and recycling of solid waste.

City of Santa Barbara Municipal Code

Chapter 7.16 – Solid Waste Management

This chapter regulates the safe handling of solid waste to protect public health and prevent nuisances such as pollution, fire hazards, and pest infestations. It requires regular collection of garbage, recyclables, and organic materials from all properties and promotes waste-stream reduction through recycling and organics diversion. Adopted under local and State authority, Chapter 7.16 implements key California solid waste laws including the Integrated Waste Management Act and SB 1383 to advance recycling, reduce landfill disposal, and support organic waste and edible food recovery programs.

[2] Santa Barbara, City of. 2011. Environmental Resources Element. https://santabarbaraca.gov/sites/default/files/documents/General%20Plan/General%20Plan/Environmental%20Resources%20Element%20%28includes%20Noise%2A%20and%20Conservation%2A%29.pdf (accessed January 2026).

4.10.3 Impact Analysis

a. Significance Criteria and Methodology

Significance Criteria

In accordance with Appendix G of the *CEQA Guidelines*, an impact related to utilities and service systems would be significant if the proposed Project would:

4. Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.
5. Not comply with federal, state, and local management and reduction statutes and regulations related to solid waste.

As mentioned above, the Initial Study completed for the proposed Project (Appendix A) determined that impacts involving Thresholds 1, 2, and 3 would be less than significant or have no impact. These impacts are discussed in Initial Study Environmental Checklist Section 19, *Utilities and Service Systems* (Appendix A). Thus, the following discussion solely focuses on Thresholds 4 and 5.

Methodology

Impacts to utilities and service systems were assessed based on the Project's potential to result in increases in demand for solid waste services such that new, expanded, modified, or relocated facilities would be required. In addition, the Project's estimated demands on utilities and service systems were analyzed in relation to potential impacts to solid waste disposal capacity, as well as for the Project's adherence to applicable federal, State and local standards, statutes, and regulations related to solid waste.

The thresholds used to evaluate solid waste impacts in this analysis are derived from the Santa Barbara County Environmental Thresholds and Guidelines Manual, which is commonly applied as the baseline CEQA framework for evaluating solid waste impacts within Santa Barbara County.

b. Project Impacts and Mitigation Measures

Threshold 4:	Would the project generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Impact UTIL-1 THE PROPOSED PROJECT WOULD NOT GENERATE SOLID WASTE IN EXCESS OF STATE OR LOCAL STANDARDS, OR IN EXCESS OF THE CAPACITY OF LOCAL INFRASTRUCTURE, OR OTHERWISE IMPAIR THE ATTAINMENT OF SOLID WASTE REDUCTION GOALS. THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

Implementation of the Project would involve demolition of the existing 10-million-gallon Vic Trace Reservoir, Valve Building, and associated infrastructure, as well as grading and construction of two new 5-million-gallon reservoirs, new buildings, site improvements, and offsite pipeline replacements.

Demolition activities are anticipated to generate approximately 2,010 cubic yards of concrete and 29 cubic yards of steel debris (Refer to Table 2-3 in Chapter 2, *Project Description*). Excavation and grading would also result in approximately up to 83,000 cubic yards of soil export, which would be

hauled off-site.[3] All demolition debris and soil would be transported to the Tajiguas Landfill, approximately 24 miles west of the Project site located in unincorporated Santa Barbara County. Tajiguas Landfill has a remaining capacity of approximately 7,345,787 cubic yards (estimated in August 2023) and an anticipated closure date of 2038. The landfill's maximum daily throughput is 9,000 tons per week.[4]

During the Project's five-month demolition and grading phases, the estimated volumes would equate to approximately 254 tons of concrete per week, 12 tons of steel per week, and 6,743 tons of soil per week. In total, demolition and grading activities would generate approximately 7,000 tons of material per week for 21 weeks. Pursuant to the California Integrated Waste Management Act (PRC Section 40000 et seq.) and CALGreen requirements, a minimum of 65 percent of the nonhazardous construction and demolition debris generated by the Project would be recycled and/or salvaged for reuse. In compliance with CALGreen, the City's Public Works Department would be required to prepare a Construction Waste Management Plan for the Project that identifies the construction and demolition waste materials to be diverted from disposal as well as the diversion facilities where construction and demolition waste material will be taken. The Construction Waste Management Plan would be required to be submitted to the City's Building and Safety Division for review and approval. As part of the waste diversion effort, a portion of the Project's construction and demolition debris may be transported and disposed of at MarBorg Industries' Construction and Demolition Recycling and Transfer Facility in Santa Barbara, which has a capacity of 1,250 tons per day and accepts general construction debris, clean dirt, and clean concrete. Compliance with California Integrated Waste Management Act and CALGreen requirements would result in the diversion of at least approximately 4,550 tons of material per week with the remaining approximate 2,450 tons of material transported to the Tajiguas Landfill. The Tajiguas Landfill has a maximum permitted throughput of 9,000 tons per week across all users. Existing disposal activities by other users would continue during the Project period and would utilize a portion of this permitted capacity.[5] Project-related disposal would therefore add to baseline landfill throughput; however, disposal rates at Tajiguas Landfill are actively managed through daily intake limits and operational controls to ensure compliance with permitted capacity. Project waste hauling would be coordinated with landfill operations and phased as necessary to avoid exceeding permitted throughput levels.

Most likely, temporary stockpiling of materials would occur at the Project site to facilitate scheduling of haul trips and reduce material export. Further, as design progresses, it is anticipated that soil exports would be lessened. As such, the Project would not result in a substantial reduction in the remaining landfill capacity or accelerate the need for new or expanded solid waste facilities.

During operation, the Project would generate minimal solid waste, limited to routine maintenance activities similar to existing conditions. The Project would comply with City of Santa Barbara solid waste reduction requirements and CalRecycle diversion mandates.

Therefore, the Project would not generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals. This impact would be less than significant.

[3] Soil export figures are based on the Project's preliminary design. As design progresses and through constructability efforts, the total net export of soils is expected to decrease.
[4] California Department of Resource Recycling and Recovery (CalRecycle). 2026. Tajiguas Sanitary Landfill and Resource Recovery Center (42-AA-0015). https://www2.calrecycle.ca.gov/SolidWaste/Site/Summary/3283 (accessed January 2026).
[5] Cumulative impacts analyzing multiple projects delivering waste at the same time are discussed in Section 4.10.4, *Cumulative Impacts*.

Mitigation Measures

No mitigation measures are required.

Threshold 5:	Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Impact UTIL-2 THE PROPOSED PROJECT WOULD COMPLY WITH FEDERAL, STATE, AND LOCAL MANAGEMENT AND REDUCTION STATUTES AND REGULATIONS RELATED TO SOLID WASTE. THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

Construction

The Project would comply with all applicable federal, State, and local regulations governing solid waste management during construction. This includes the RCRA, which establishes cradle-to-grave requirements for the handling, storage, and disposal of hazardous and non-hazardous waste. Construction activities may involve small quantities of hazardous materials (e.g., fuels, solvents, oils), all of which would be stored and disposed of in accordance with RCRA requirements, preventing releases to soil or groundwater and ensuring proper disposal.

Construction Waste Management Plan

The California Integrated Waste Management Act (PRC Section 40000 et seq.) and CALGreen require at least 65 percent diversion[6] of non-hazardous construction and demolition debris, as well as preparation and implementation of a Construction Waste Management Plan. The Project would include the implementation of a Construction Waste Management Plan to ensure proper sorting, recycling, and diversion. Compliance with AB 939, SB 1016, and SB 1383 would also be achieved, as construction waste would be processed through the City's existing collection, diversion, and organics recovery system.

Landfill Capacity

Regarding landfill capacity, construction activities would generate an estimated 4,223 tons of concrete, 194 tons of steel, and an estimated 83,000 cubic yards of soil. Demolition and other debris would likely be hauled to the South Coast Recycling & Transfer Station (4430 Calle Real, Goleta), which would direct trash to the Tajiguas Landfill (14470 Calle Real, Goleta). Diverted materials would be separated and transported to appropriate regional recycling facilities depending on material type. Concrete and masonry materials could be delivered to permitted construction and demolition recycling or aggregate recovery facilities such as Granite Construction, Lash Construction, or the MarBorg Construction & Demolition Recycling Facility (119 North Quarantina Street, Santa Barbara), where clean concrete and rubble are accepted for crushing and reuse as recycled aggregate. Structural steel and rebar could be hauled to licensed scrap metal recyclers such as Santa Barbara Iron & Metal Recyclers (709 East Gutierrez Street, Santa Barbara) or similar facilities operating within Santa Barbara County that accept construction-generated steel for recycling. As mentioned above, a Construction Waste Management Plan would be prepared in accordance with applicable CALGreen requirements to identify materials subject to diversion,

[6] For purposes of this analysis, "diversion" refers to the separation and recovery of construction and demolition materials from the waste stream through recycling, reuse, or salvage, such that these materials are not disposed of at a landfill. Diverted materials are typically separated on-site or at a transfer station and transported to permitted recycling or recovery facilities, while only residual, non-recoverable materials are sent to landfill for disposal. Materials anticipated to be diverted include concrete, masonry, asphalt, structural steel, rebar, and other metals.

designate approved recycling and disposal facilities, and establish documentation procedures to verify diversion rates. Based on the anticipated volumes of recyclable concrete and steel, the Project would be capable of achieving or exceeding the minimum 65-percent diversion requirement.

City Solid Waste Management

At the local level, construction waste handling would comply with Santa Barbara Municipal Code Chapter 7.16, which requires the collection of recyclables, organics, and other recoverable materials. For utility infrastructure projects, the applicable provisions of Chapter 7.16 focus on construction-phase waste handling rather than building occupancy-related requirements. Specifically, Chapter 7.16 requires construction projects to implement procedures for identifying and separating recyclable and recoverable construction and demolition materials, such as concrete, masonry, metals, and other materials that can be feasibly diverted from landfill disposal. Accordingly, recyclable and recoverable materials would be separated and diverted to appropriate recycling or salvage facilities prior to disposal. Construction waste would be processed through the South Coast Recycling and Transfer Station and Tajiguas Landfill system, which would receive only residual materials remaining after recyclable and recoverable materials have been diverted.

Operation

During operation, the Project would continue to comply with federal, State, and local solid waste regulations. The Project would not generate operational hazardous waste and therefore compliance with RCRA would be maintained.

State

Operational solid waste would be subject to AB 939, SB 1016, and SB 1383, all of which are already implemented through the City's established collection, recycling, and organics management programs. Ongoing operation and maintenance activities would be minimal and would primarily include routine site inspections, vegetation management, minor repairs to equipment, and replacement of small components such as valves, gaskets, or instrumentation. These activities would generate limited quantities of solid waste, largely consisting of packaging materials, vegetation trimmings, and occasional debris from minor repairs. No component of the Project's operation would interfere with the City's ability to meet required diversion or organics recovery targets.

County

The Santa Barbara County Environmental Thresholds and Guidelines Manual identifies 196 tons per year (post-recycling) as the level at which a project would generate a significant operational solid waste impact and 40 tons per year as the cumulatively considerable threshold.[7] Because the Project would generate only negligible volumes of operational waste, limited to routine maintenance activities consistent with existing conditions, the Project's operational waste stream would remain well below County thresholds. Additionally, although the Santa Barbara County Environmental Thresholds and Guidelines Manual addresses operational solid waste generation, its quantitative significance thresholds are intended to evaluate long-term operational solid waste generation from residential and commercial development. [8] Because infrastructure projects of this type do not

[7] Santa Barbara, County of. 2024. Environmental Thresholds and Guidelines Manual. https://content.civicplus.com/api/assets/3a8f7de7-7ec5-4971-8ec4-326ec1dc3f23 (accessed January 2026).
[8] Santa Barbara, County of. 2024. Environmental Thresholds and Guidelines Manual. https://content.civicplus.com/api/assets/3a8f7de7-7ec5-4971-8ec4-326ec1dc3f23 (accessed January 2026).

generate operational waste the Project would not contribute to the County's annual operational solid waste significance thresholds.

City

Locally, the Project would comply with SBMC Chapter 7.16 and the City's General Plan Environmental Resources Element (Policy ER22), which supports recycling and waste-reduction programs. Solid waste generated during operation would be collected, sorted, and diverted through the City's existing waste management system, with remaining residuals transported to Tajiguas Landfill, which has adequate remaining capacity.

Conclusion

Because the Project would comply with applicable federal (RCRA), State (AB 939, SB 1016, SB 1383, CALGreen), and local (SBMC Chapter 7.16, General Plan Policy ER22) solid waste regulations; would implement a Construction Waste Management Plan; and would generate negligible operational waste relative to County thresholds, the Project would not conflict with a solid waste statute, regulation, or policy. Impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

4.10.4 Cumulative Impacts

The cumulative impact area for solid waste includes the portion of the Santa Barbara region served by the South Coast Recycling and Transfer Station and the Tajiguas Landfill, which together handle nearly all of the City's solid waste. This geographic scope is appropriate because both construction- and operational-phase waste generated by regional development is processed and disposed of through this system. The projects listed in Table 3-1 in Chapter 3, *Environmental Setting*, represent development and redevelopment within the region that could incrementally increase demand for solid waste collection, processing, and disposal services. Buildout of past, present, and reasonably foreseeable future projects would result in the generation of solid waste during both construction and operational phases.

Cumulative development would generate construction and operational waste that would be transported to and processed within the South Coast Recycling and Transfer Station and ultimately disposed of at the Tajiguas Landfill.[9] All cumulative projects would be required to comply with federal, State, and local solid waste reduction and diversion mandates, including the California Integrated Waste Management Act (AB 939), mandatory commercial recycling (AB 341), per-capita disposal requirements (SB 1016), and organic waste diversion and edible food recovery requirements (SB 1383). Local compliance with the City of Santa Barbara Municipal Code Chapter 7.16 and General Plan Policy ER22 would further ensure diversion of recyclables and organics consistent with City programs. Because cumulative projects must participate in these regulatory programs, the volume of residual waste requiring landfill disposal would be reduced to the maximum extent feasible.

[9] California Department of Resource Recycling and Recovery (CalRecycle). 2026. Tajiguas Sanitary Landfill and Resource Recovery Center (42-AA-0015). https://www2.calrecycle.ca.gov/SolidWaste/Site/Summary/3283 (accessed January 2026).

Although the Project would generate up to approximately 7,000 tons of material per week during peak demolition and grading activities, representing about 77 percent of the landfill's permitted weekly throughput of 9,000 tons, this total reflects gross material generation prior to diversion and does not represent the volume ultimately disposed of at the landfill. The majority of high-volume materials generated by the Project, including concrete, masonry, structural steel, and a substantial portion of excavated soil, would be diverted from landfill disposal through recycling, reuse, or beneficial reuse consistent with CALGreen and local requirements.

In addition, Project constructability reviews and ongoing design refinement would focus on minimizing demolition waste, optimizing material quantities, and sequencing construction activities to reduce waste generation and hauling peaks. These measures would further limit landfill-bound waste during periods of overlapping construction activity.

Tajiguas Landfill maintains a permitted daily intake of up to 1,500 tons per day. While it is possible that multiple large construction projects generating high volumes of non-divertable waste during overlapping periods could approach permitted intake limits, such conditions are unlikely given mandatory diversion requirements, material-specific recycling pathways, and active landfill intake management. Accordingly, when considering existing conditions, mandatory diversion, material-specific recycling of concrete and steel, and soil reuse, the regional solid waste system would have adequate capacity to accommodate cumulative construction and operational waste through the facility's anticipated 2038 closure date. Therefore, cumulative impacts related to solid waste disposal capacity would be less than significant.

This page intentionally left blank.

4.11 Effects Found Not to be Significant

Section 15128 of the *CEQA Guidelines* requires an Environmental Impact Report (EIR) to briefly describe any possible effects that were determined not to be significant and were therefore not discussed in detail in the EIR. The sections below include the checklist questions listed in Appendix G of the *CEQA Guidelines* and a brief discussion of environmental impacts that were determined to be less than significant. Any items not addressed in this section are addressed in Sections 4.1 through 4.10 of the EIR.

As evaluated in the Initial Study conducted for the proposed Project (Appendix A), the Project would not result in significant impacts to Agriculture and Forestry Resources, Energy, Hydrology and Water Quality, Land Use and Planning, Mineral Resources, Population and Housing, Public Services, Recreation and Wildfire. In addition, several environmental topics included thresholds that were screened out in the Initial Study because they would result in no impact or a less-than-significant impact. These screened-out thresholds are described below, while the remaining thresholds requiring further analysis are evaluated in the corresponding resource sections of this EIR.

4.11.1 Aesthetics

Potential Environmental Effects

Would the Project:

a. Have a substantial adverse effect on a scenic vista?
b. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?
c. In nonurbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings?

Impact Analysis

Threshold a. The Project site on Lavigia Hill is not identified in the City's General Plan as a designated scenic vista,[1] and public views of the site are limited by lower street elevations, intervening development, fencing, and the parcel's elevated topography. While portions of the southwest slope may be visible from Cliff Drive and construction would introduce temporary visual activity, these activities would not obstruct scenic views of the Pacific Ocean, coastal shoreline, or the Santa Ynez Mountains due to intervening topography and structures. During operation, off-site improvements to pipelines and the PRV would be primarily underground, and minor above-ground appurtenances would be visually consistent with City water infrastructure. Visual renderings indicate the new, largely buried facilities on the Vic Trace parcel would generally not be visible from public vantage points, with La Coronilla Park retaining a visual character similar to existing conditions. Accordingly, the Project would not result in a substantial adverse effect on a scenic vista, and impacts would be less than significant.

[1] Santa Barbara, City of. 2011c. Plan Santa Barbara Environmental Resources Element. https://santabarbaraca.gov/sites/default/files/documents/General%20Plan/General%20Plan/Environmental%20Resources%20Element%20%28includes%20Noise%2A%20and%20Cons ervation%2A%29.pdf (accessed January 2026).

Threshold b. The Project site is not located within the viewshed of a State-designated scenic highway. The nearest such route is State Route 154, located approximately 3.5 miles northwest, and the site is not adjacent to or visible from local scenic roads identified by the City. Because the site is not visible from state or local scenic highways or view corridors, the Project would not substantially damage scenic resources as viewed from a state scenic highway. No impact would occur.

Threshold c. The City of Santa Barbara qualifies as an "urbanized area" under CEQA §21071. Therefore, the analysis focuses on consistency with applicable zoning and other regulations governing scenic quality. The Vic Trace parcel (RS-15/Institutional) and La Coronilla Park (P-R/Parks & Open Space) allow the proposed public utility and municipal uses, and the Project would be an allowable use subject to discretionary review and applicable development standards. Above-ground structures would be modest in scale (maximum height approximately 14 feet), with architecture compatible with surrounding development, and most new infrastructure is underground. Vegetation removal would include up to 55 trees, including approximately seven coast live oaks, with replacement on the parcel and compliance with the City's Tree Preservation Ordinance. Landscaping would employ native, drought-tolerant, or fire-resistant species and comply with the Hillside Vegetation Removal and Water Efficient Landscape standards. The site is not within a Special Design District, Scenic Overlay Zone, or a Coastal Zone view corridor. Accordingly, the Project would not degrade the visual character or quality of public views or conflict with applicable scenic quality regulations. Impacts would be less than significant.

4.11.2 Agricultural Resources

Potential Environmental Effects

Would the Project:

a. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?
b. Conflict with existing zoning for agricultural use or a Williamson Act contract?
c. Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?
d. Result in the loss of forest land or conversion of forest land to non-forest use?
e. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?

Impact Analysis

Thresholds a-e. The Project Site is located within an urbanized residential neighborhood in the city of Santa Barbara and does not contain agricultural land, designated farmland, or land under Williamson Act contract. Additionally, the zoning and land use designation do not support forest land uses. According to the City's General Plan land use maps, the Project site is fully developed and contains no Prime Farmland, Unique Farmland, Farmland of Statewide Importance, or forest/timberland. Therefore, the Project would have no impact on agricultural or forestry resources.

4.11.3 Air Quality

Potential Environmental Effects

Would the Project:

a. Conflict with or obstruct implementation of the applicable air quality plan?

d. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Impact Analysis

Threshold a. The Project would not conflict with or obstruct implementation of the Santa Barbara County Clean Air Plan or the Ozone Plan. Direct and indirect emissions associated with construction and operation of the Project are already accounted for in the emissions growth assumptions underlying these regional air quality plans. The Project incorporates standard construction dust suppression and exhaust control measures required by the Santa Barbara County APCD, and would comply with applicable APCD rules and regulations and City ordinance provisions related to construction emissions. In addition, the Project does not introduce new population, trip-generating land uses, or stationary emission sources beyond those typical for municipal water infrastructure. Thus, the Project's operational emissions would remain consistent with the assumptions and control strategies in the Clean Air Plan and Ozone Plan, and the Project would not conflict with or obstruct implementation of applicable air quality plans. Impacts would be less than significant.

Threshold d. The Project does not include land uses or processes typically associated with objectionable odors, such as industrial operations, wastewater treatment, composting, large-scale fuel storage, or food-processing facilities. Construction activities would include short-term use of fuels, lubricants, and asphaltic materials. However, such odors would be temporary, localized, and would not affect a substantial number of people in the surrounding residential neighborhood. Operationally, the Project would continue to function as a potable water storage and distribution facility and would not introduce new odor-producing processes. No features associated with long-term odors are proposed. The facility would operate similarly to existing conditions and would not generate objectionable odors affecting a substantial number of people. Therefore, this impact would be less than significant.

4.11.4 Biological Resources

Potential Environmental Effects

Would the Project:

c. Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Impact Analysis

Threshold c. The Project site does not contain any state or federally protected wetlands or other jurisdictional waters. The Initial Study confirms that no riparian habitat, marsh, vernal pools, coastal wetlands, or other waters subject to U.S. Army Corps of Engineers, Regional Water Quality Control Board, or California Department of Fish and Wildlife jurisdiction are present within or adjacent to the Vic Trace Reservoir parcel or off-site improvement areas. Because no wetlands occur onsite, the Project would not result in the removal, filling, hydrological interruption, or other substantial adverse effects to protected wetlands. Therefore, no impact would occur.

Threshold d. The Project site is not located within a designated wildlife corridor and does not support native resident or migratory wildlife movement pathways due to surrounding residential development and the fenced, secured nature of the reservoir parcel. The Initial Study found no wildlife movement corridors or nursery sites onsite and noted that the parcel does not function as a connector between larger habitat areas. Although site vegetation may provide low-value foraging habitat for common species, construction activities would temporarily displace wildlife but would not interfere with regional movement patterns or impede access to nursery sites. Wildlife is expected to return following construction. Therefore, the Project would not substantially interfere with wildlife movement or nursery site use, and this impact would be less than significant.

Threshold f. No Habitat Conservation Plan, Natural Community Conservation Plan, or other approved conservation plan applies to the City of Santa Barbara or the Project area. The Initial Study confirms that the Project site is not subject to any HCP or NCCP, nor is it located within any jurisdictional boundary governed by such conservation programs. Therefore, the Project would not conflict with any adopted habitat conservation plan. No impact would occur.

4.11.5 Cultural Resources

Potential Environmental Effects

Would the Project:

a. Cause a substantial adverse change in the significance of a historical resource pursuant to CEQA §15064.5?

c. Disturb any human remains, including those interred outside of formal cemeteries?

Impact Analysis

Threshold a. The existing 1956 reservoir and associated valve structure is the only structure over 45 years old. These facilities were formally recorded and evaluated for eligibility for listing in the National Register of Historic Places, the California Register of Historical Resources, and for local designation as a City Landmark or Structure of Merit. The evaluation concluded that the reservoir and associated structures are ineligible under all applicable criteria and therefore do not constitute historical resources under CEQA §15064.5, the National Historic Preservation Act §106, or the City's Master Environmental Assessment criteria. Because no on-site features qualify as historical resources, Project demolition of the reservoir, valve building, or associated infrastructure would not result in a substantial adverse change in the significance of a historical resource. This impact would be less than significant.

Threshold c. The Initial Study found no evidence of human remains within the Vic Trace Reservoir parcel or any of the off-site improvement areas. Although portions of the Project site are considered archaeologically sensitive, standard procedures consistent with California Health and Safety Code §7050.5 and *CEQA Guidelines* §15064.5(e) would be implemented in the event of an unanticipated discovery. These procedures require immediate cessation of work in the vicinity of the find, notification of the County Coroner, and notification of the Native American Heritage Commission and consultation with the Most Likely Descendant if remains are determined to be Native American. With these existing regulatory requirements in place, the potential to disturb human remains would be adequately minimized, and any discovery would be handled in accordance with State law. Therefore, impacts related to human remains would be less than significant.

4.11.6 Energy

Potential Environmental Effects

Would the Project:

a. Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?
b. Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Impact Analysis

Threshold a-b. Construction of the Project would require energy in the form of diesel and gasoline for heavy equipment, haul trucks, worker trips, and construction support vehicles. These activities would be temporary and typical of municipal infrastructure projects of similar scale. Contractors would comply with California Air Resources Board diesel idling limits and off-road fleet requirements, and construction would utilize modern, fuel-efficient equipment where available.

Operation of the Project would increase electricity use by approximately 70,000 kilowatt-hours per year due to the upgraded La Coronilla Pump Station and new security systems; however, this increase would be partially offset because an existing pump station within the City would transition to a low-use standby facility. The Project may also include a 60-kilowatt photovoltaic system and potential battery storage, directly supporting local renewable-energy goals. All new buildings would be constructed in compliance with California Title 24 energy-efficiency standards and the City's energy-efficiency regulations. The Project would not conflict with any State or local plans for renewable energy or energy efficiency, including the City's 2024 Climate Action Plan, which encourages electrification and the installation of onsite renewable generation. Accordingly, construction and operation of the Project would not result in wasteful, inefficient, or unnecessary energy consumption, and impacts would be less than significant.

4.11.7 Geology and Soils

Potential Environmental Effects

Would the Project:

a. Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i. Rupture of a known earthquake fault as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault? (Refer to Division of Mines and Geology Special Publication 42)

ii. Strong seismic ground shaking?

iii. Seismic-related ground failure, including liquefaction?

iv. Landslides?

c. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, collapse or sea cliff failure?

d. Be located on expansive soils, as defined Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risk to life or property?

e. Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

Impact Analysis

Threshold a(i). The Project site is not located within an Alquist-Priolo Earthquake Fault Zone, and no mapped fault traces cross the site. The nearest known active fault, the Lavigia (North Channel Slope) fault, lies approximately 1,000 feet south of the Project site. As a result, the potential for fault rupture at the site is considered low, and no fault-setback requirements apply. Accordingly, the Project would not directly or indirectly expose people or structures to substantial adverse effects involving fault rupture. Therefore, there would be no impact.

Threshold a(ii). Like most of Southern California, the site may be subject to strong ground shaking during a major seismic event. However, the buried reservoirs, retaining walls, and valve building, would be designed and constructed consistent with the California Building Code and American Water Works Association standards. These seismic design requirements ensure structural performance under expected loading conditions. Compliance with applicable building codes would reduce risks associated with strong seismic ground shaking, and this impact would be less than significant.

Threshold a(iii). Geotechnical investigations documented that groundwater was not encountered within the upper 50 feet of the site and that the Project area is underlain by dense Santa Barbara Formation bedrock, conditions that render the site not susceptible to liquefaction. Because liquefaction potential is low and new structures must comply with CBC seismic design criteria, the Project would not result in substantial adverse effects related to seismic-related ground failure. This impact would be less than significant.

Threshold a(iv). The Project site is not located within a mapped Seismic Hazard Zone for earthquake-induced landslides, and no active landslides occur on or near the parcel. Although grading could temporarily affect slope stability, design measures including retaining walls, erosion control, and slope stabilization consistent with the CBC and City requirements would ensure slope stability during and after construction. Landslide impacts would be less than significant.

Threshold c. The geotechnical analysis concludes that the Vic Trace Reservoir parcel is underlain primarily by dense bedrock and engineered fill, with no evidence of unstable geologic units susceptible to lateral spreading, subsidence, or collapse. Lateral spreading risk is low due to both the absence of nearby free faces and the presence of competent underlying materials. Liquefaction

potential is also low due to lack of shallow groundwater. The previously abandoned onsite oil well would be re-abandoned under CalGEM oversight, reducing any potential subsidence hazard associated with the well. The site is located over 0.75 miles inland and is not subject to sea cliff failure. With adherence to applicable building codes and geotechnical recommendations, the Project would not result in instability on- or off-site. Impacts would be less than significant.

Threshold d. Soils at the Project site do not exhibit characteristics of expansive or collapsible behavior. Geotechnical testing found underlying materials to be compacted and stable, and the CBC requires appropriate foundation design to address any soil-related concerns. Because expansive soils are not present and design measures will comply with CBC standards, impacts would be less than significant.

Threshold e. The Project does not propose the use of septic systems or alternative wastewater disposal systems. Therefore, no impact related to inadequate soils for septic systems would occur.

4.11.8 Hazards and Hazardous Resources

Potential Environmental Effects

Would the Project:

a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?
c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one quarter mile of an existing or proposed school?
d. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would it create a significant hazard to the public or the environment?
e. For a project located within the SBCAG Airport Land Use Compatibility Plan, Airport Influence Area, would the project result in a safety hazard or excessive noise for people residing or working in the project area?
f. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?
g. Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

Impact Analysis

Threshold a. During construction, the Project would use small quantities of typical construction-related hazardous materials such as fuels, lubricants, oils, and adhesives. These materials would be handled, transported, and disposed of in accordance with federal and State regulations, including RCRA and California DTSC requirements. Operationally, the Project would store only limited quantities of hazardous materials, primarily diesel to power the standby generator and chemicals used in the hypochlorite disinfection system. Such uses are consistent with existing conditions on the parcel and would be subject to standard regulatory controls. The Project would not produce hazardous waste as part of its water system operations. Therefore, the Project would not create a significant hazard to the public or environment through routine hazardous materials use. This impact would be less than significant.

Threshold c. Washington Elementary School is located approximately 0.23 miles south of the Vic Trace Outlet Main on Meigs Road. Construction activities would involve temporary use of fuels and other materials typical of utility construction. However, these materials would be handled in compliance with OSHA and industry standards, and would not result in hazardous emissions near the school. Operationally, the Project would not involve hazardous materials handling in proximity to the school, as the Vic Trace parcel is located approximately 0.45 miles away. This impact would be less than significant.

Threshold d. A review of the SWRCB GeoTracker, DTSC EnviroStor, and Cortese List databases confirms that no hazardous materials sites are located at, adjacent to, or within 1,000 feet of the Project site. Therefore, the Project is not located on a site included on a list of hazardous materials sites, and no impact would occur.

Threshold e. The Project site is not located within the Santa Barbara County Association of Governments' Airport Land Use Compatibility Plan area.[2] As such, the Project would not expose workers, residents, or visitors to airport-related safety hazards or noise. No impact would occur.

Threshold f. Construction activities would occur within a secured City-owned parcel and within public rights-of-way. Traffic control measures such as signage, flaggers, and phased closures would be implemented to maintain emergency access at all times. Construction parking and staging would occur onsite at the Vic Trace parcel, avoiding interference with public streets. The Project would not permanently alter roadways or reduce access for emergency vehicles, and operational traffic would be similar to existing conditions. Accordingly, the Project would not impair or interfere with adopted emergency response or evacuation plans. This impact would be less than significant.

Threshold g. The Project site is not within a State Responsibility Area or State-designated Fire Hazard Severity Zone,[3] although it is located within a local High Fire Hazard Area identified in the City's Community Wildfire Protection Plan.[4] Project design features including non-combustible construction materials, a 24-foot access road, perimeter access for fire suppression, and landscaping compliant with defensible space and fuel modification requirements would reduce wildfire risk. Construction would comply with fire safety standards including spark arrestor requirements and limits on high-fire-risk activities. The Project would not exacerbate wildfire hazards or expose people or structures to risk of loss, injury, or death. This impact would be less than significant.

4.11.9 Hydrology and Water Quality

Potential Environmental Effects

Would the Project:

a. Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?
b. Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

[2] SBCAG. 2023. Santa Barbara Airport Land Use Compatibility Plan. https://www.sbcag.org/wp-content/uploads/2023/09/sba_alucp_final.pdf (accessed February 2026).
[3] California Department of Forestry and Fire Protection (CAL FIRE). 2025. Find Your Fire Hazard Severity Zone (FHSZ). https://experience.arcgis.com/experience/5065c998b4b0462f9ec3c6c226c610a9 (accessed January 2026).
[4] Santa Barbara, City of. 2021. Community Wildfire Protection Plan. https://santabarbaraca.gov/sites/default/files/documents/Fire/Community%20Wildfire%20Protection%20Plan/2021%20Community%20Wildfire%20Protection%20Plan%20%28CWPP%29.pdf (accessed February 2026).

c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
   i. Result in substantial erosion or siltation on- or off-site;
   ii. Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;
   iii. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or
   iv. Impede or redirect flood flows?

d. In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

e. Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Impact Analysis

Thresholds a-e. Construction activities would temporarily increase the potential for erosion and sediment transport. However, the Project must comply with the National Pollutant Discharge Elimination System Construction General Permit, prepare and implement a Storm Water Pollution Prevention Plan, and adhere to the City's Storm Water Best Management Practices Technical Guidance Manual (Tier 4). These requirements include erosion and sediment controls, stabilized construction access points, proper material handling, and stormwater containment. The Project would not use groundwater or install groundwater wells and would not interfere with groundwater recharge. Much of the Vic Trace Reservoir parcel would remain pervious, and stormwater would be directed to vegetated swales and onsite stormwater storage areas designed to promote infiltration and mimic existing hydrologic conditions. Improved storm drain piping and grading would maintain existing drainage patterns and prevent increased runoff or flooding on- or off-site. Overflow would continue to discharge to the existing Dolores Drive storm drain system via La Coronilla Park, similar to current conditions. The Project site is not located within a 100-year flood zone, tsunami zone, or seiche hazard area and therefore would not risk pollutant release due to inundation.

As the Project would comply with all applicable water quality regulations and would not alter drainage patterns in a manner that would cause erosion, flooding, or pollutant discharge, impacts to hydrology and water quality would be less than significant.

4.11.10 Land Use and Planning

Potential Environmental Effects

Would the Project:

a. Physically divide an established community?

b. Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Impact Analysis

Thresholds a and b. The Project would replace existing water infrastructure on the Vic Trace Reservoir parcel and within public rights-of-way and would not introduce new land uses. The Project site's existing General Plan designations are Institutional and Parks/Open Space, and the zoning designations of RS-15 and P-R allow for public utility infrastructure and park-supporting facilities. The Project is consistent with these land use and zoning designations and does not require amendments to the general plan.

All construction and operational activities would occur within the Vic Trace Reservoir parcel or public roadways, and no elements would divide an established community or introduce incompatible uses. Therefore, the Project would not conflict with land use plans or policies, and impacts would be less than significant.

4.11.11 Mineral Resources

Potential Environmental Effects

Would the Project:

a. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?
b. Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

Impact Analysis

Thresholds a and b. There are no known mineral resource extraction sites or designated mineral resource zones on or adjacent to the Project site (Department of Conservation 2011, 2016). The Project site is fully developed with water infrastructure and is located within a residential neighborhood. Although an abandoned oil well exists beneath the existing reservoir, it has no production history and would be re-abandoned to current California Geologic Energy Management standards. Re-abandonment would not affect availability of any mineral resources.

Because no mineral resource recovery areas occur in or near the Project area, and the Project does not preclude future mineral extraction elsewhere, the Project would have no impact on mineral resources.

4.11.12 Noise

Potential Environmental Effects

Would the Project:

c. For a project located within the vicinity of a private airstrip or the SBCAG Airport Land Use Plan/Airport Influence Area, would the project expose people residing or working in the project area to excessive noise levels?

Impact Analysis

Threshold c. The Project site is not located within the vicinity of a private airstrip nor within the SBCAG Airport Land Use Plan or Airport Influence Area for the Santa Barbara Airport. Because the

parcel is not subject to airport-related overflight, approach, or takeoff noise exposure zones, the Project would not expose workers or nearby residents to excessive aviation noise levels. Accordingly, no impact would occur under this threshold.

4.11.13 Population and Housing

Potential Environmental Effects

Would the Project:

a. Induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure)?
b. Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

Impact Analysis

Thresholds a and b. The Project would involve replacement of water infrastructure and would not include residential development, development of new businesses or areas for commercial development, long-term employment growth, or any other use that would induce population growth. No housing exists on the Vic Trace parcel, and none would be removed. The Project would not extend infrastructure in a manner that would facilitate new development beyond that already allowed under the City's General Plan.

Therefore, the Project would not induce population growth or displace housing, and there would be no impact.

4.11.14 Public Services

Potential Environmental Effects

Would the Project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

- Fire protection?
- Police protection?
- Schools?
- Parks?
- Other public facilities?

Impact Analysis

Threshold a. The Project would not increase population or introduce uses that require expanded fire, police, school, or other governmental services. Construction activities are temporary and would not substantially burden public services. After construction, the Project would operate similarly to existing conditions, with maintenance activities comparable to current levels. The improved site

access road, installation of turnarounds, and modernized facilities would support long-term emergency response and operational reliability.

Because no new public facilities would be required to serve the Project, impacts to public services would be less than significant.

4.11.15 Recreation

Potential Environmental Effects

a. Would the Project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?
b. Does the Project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Impact Analysis

Thresholds a and b. La Coronilla Park occupies the western portion of the Vic Trace Reservoir parcel and would experience temporary construction-related closures of up to one month for underground pipeline work and potential temporary access routes. All improvements within the park would be underground, and disturbed areas would be restored to pre-Project conditions upon completion. Because the Project does not include new residential development and would not increase long-term demand for park facilities, it would not cause deterioration of recreational resources. The Project would not include new recreational facilities nor require expansion of any existing recreational amenities.

Therefore, Project effects on recreation would be less than significant.

4.11.16 Transportation

Potential Environmental Effects

Would the Project:

b. Conflict or be inconsistent with *CEQA Guidelines* Section 15064.3, subdivision (b) (Criteria for Analyzing Transportation Impacts)?
c. Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?
d. Result in inadequate emergency access?

Impact Analysis

Threshold b. The Project does not include new trip-generating land uses and involves only the replacement and rehabilitation of existing municipal water infrastructure. Under the City's Master Environmental Assessment Guidelines, the Project qualifies as a "small project" because it would generate fewer than 250 daily vehicle trips and therefore is presumed to have a less-than-significant VMT impact. Construction-related trips are temporary and are not considered under *CEQA Guidelines* §15064.3(b), and long-term operational activity would remain similar to existing conditions. Because the Project does not increase VMT or introduce VMT-intensive uses, it would

not conflict with or be inconsistent with *CEQA Guidelines* §15064.3(b). This impact would be less than significant.

Threshold c. The Project does not include the construction of new public roadways or alterations to the configuration of existing public streets that would introduce hazardous design features. All construction activities within public rights-of-way would be temporary and controlled through standard traffic control measures, including signage and flaggers. Operationally, the Project would improve safety by replacing the existing one-lane reservoir access road with a 24-foot-wide roadway for emergency vehicle access. No incompatible uses or roadway geometry changes that could increase hazards (e.g., new intersections, sharp curves, or high-speed access points) would occur. Therefore, the Project would not substantially increase hazards due to design features or incompatible uses. This impact would be less than significant.

Threshold d. Emergency access would be maintained throughout construction through phased work areas, traffic control, and onsite construction parking and staging that avoids blocking public streets. The replacement of the existing narrow access road with a 24-foot-wide paved access road, installation of fire-truck turnaround areas, and construction of a perimeter access road for fire personnel would improve long-term on-site emergency access. No permanent roadway closures or reductions in emergency access routes would occur, and operational traffic would be similar to existing conditions. Therefore, the Project would not result in inadequate emergency access, and the impact would be less than significant.

4.11.17 Utilities and Service Systems

Potential Environmental Effects

Would the Project:

a. Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction of which could cause significant environmental effects?
b. Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?
c. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Impact Analysis

Threshold a. The Project consists of replacing existing water storage facilities and upgrading existing water distribution infrastructure. The Initial Study concludes that the Project itself does not create new water demand or require additional system improvements beyond those already included within the Project's scope. New or modified infrastructure (e.g., water mains, PRV station, reservoir replacement, IT/communications upgrades) is limited to the replacement, relocation, or rehabilitation of existing utility components and does not represent system expansion that could trigger additional environmental effects beyond those already analyzed. Accordingly, the Project would not require or result in the need for new or expanded water, wastewater treatment, stormwater, electric, natural gas, or telecommunications facilities beyond those addressed in Chapter 2, *Project Description*. This impact would be less than significant.

Threshold b. The Project would not introduce new land uses or population that would increase long-term water demand. The replacement reservoirs would maintain existing storage capacity and improve operational efficiency and reliability of the City's potable water system. The Initial Study states that the City's Water Distribution Infrastructure Plan confirms that sufficient offsite storage and supply capacity exists to accommodate water needs during construction and under normal, dry, and multiple dry-year conditions. Because the Project serves to maintain and upgrade existing water system components without increasing demand, water supplies are adequate, and this impact would be less than significant.

Threshold c. The Project would generate minimal wastewater, limited to the restroom within the new valve building. This volume would be negligible compared to wastewater flows typically generated by residential or commercial land uses. The Initial Study confirms that the City's El Estero Water Resource Center has adequate treatment capacity to accommodate existing and projected flows, as well as any nominal demand associated with the Project. Because the Project does not involve new development that would generate additional wastewater demand, treatment capacity would remain sufficient, and this impact would be less than significant.

4.11.18 Wildfire

Potential Environmental Effects

If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the Project:

a. Substantially impair an adopted emergency response plan or emergency evacuation plan?
b. Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?
c. Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?
d. Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

Impact Analysis

Thresholds a-d. The Project site is located within a City-identified Fire Hazard Area but is not within a State Responsibility Area or California Department of Forestry and Fire Protection Very High Fire Hazard Severity Zone (CAL FIRE 2026). Construction activities would comply with all fire-safety regulations, including equipment spark-arrestor requirements and onsite fire-suppression equipment. The Project would improve emergency access by replacing the existing one-lane access road with a new 24-foot-wide paved road, installing two fire-department-compliant security gates with Knox boxes, and providing dedicated fire-truck turnaround areas and a 12-foot-wide perimeter access road. Landscaping would follow the City's High Fire Hazard Area Defensible Space Requirements, using drought-tolerant, fire-resistant species. No components would introduce new ignition sources or expand fire-prone development. Additionally, no Project design features would exacerbate post-fire hazards such as runoff, landslides, or debris flows beyond existing conditions.

Accordingly, the Project would not exacerbate wildfire risk or impair emergency response or evacuation. Impacts related to wildfire would be less than significant.

5 Other CEQA Required Discussions

This section discusses growth-inducing impacts and irreversible environmental impacts that would be caused by the Vic Trace Reservoir Replacement Project (hereafter referred to as the "Project").

5.1 Growth Inducement

CEQA Guidelines Section 15126(d) requires a discussion of a project's potential to foster economic or population growth, including ways in which a project could remove an obstacle to growth. Growth does not necessarily create significant physical changes to the environment. However, depending upon the type, magnitude, and location of growth, it can result in significant adverse environmental effects. The Project's growth inducing potential would therefore be considered significant if reasonably foreseeable induced growth could result in significant physical effects in one or more of the issue areas:

- Population growth;
- Economic growth; or
- Removable obstacles to growth.

These issue areas are discussed in Section 5.1.1 through Section 5.1.3 below.

5.1.1 Population Growth

As discussed in Section 4.11.13, *Population and Housing*, the Project would not develop new residences or involve a substantial increase in major public facilities, such as extension of water or sewer lines or roads that would facilitate other growth in the area. The Project would not expand the service area or storage capacity at the Vic Trace site. The Project is intended to result in enhanced system reliability, not additional water supplies to facilitate population growth. Therefore, the Project does not have the potential to result in population growth in Santa Barbara and would not result in environmental impacts associated with population growth.

5.1.2 Economic Growth

The Project would generate temporary employment opportunities during construction, typical of municipal construction projects. Given the size of the Project and the temporary nature of construction, construction workers would be expected to be drawn from the existing regional work force. As a result, construction of the Project would not be growth-inducing from a temporary employment standpoint. As described in Section 4.11.13, *Population and Housing*, the Project does not include the development of new businesses or areas for commercial development and would not result in long-term employment growth that would increase population or housing demand. Operation and maintenance activities would be conducted by existing City staff, as under current conditions. Therefore, the Project would not induce substantial economic expansion to the extent that direct physical environmental effects would occur.

5.1.3 Removal of Obstacles to Growth

The Project site is in an urbanized area that is served by existing infrastructure. While utility work would occur as part of the Project, the Project would not require major infrastructure extensions into areas not already served by existing facilities. In addition, the Project does not include the extension of any roads or other infrastructure into an undeveloped and unpopulated area. Furthermore, the Project would not include any increase in the reservoir's storage capacity and would therefore not result in any increase in available water supply. Accordingly, the Project would not remove obstacles to growth.

5.2 Irreversible Environmental Effects

The *CEQA Guidelines* require that EIRs contain a discussion of significant irreversible environmental changes. This section addresses non-renewable resources, the commitment of future generations to the proposed uses, and irreversible impacts associated with the proposed Project.

Construction and operation of the Project would not irreversibly increase local demand for non-renewable energy resources such as petroleum-based fuels or natural gas. Construction-related fuel use would be temporary and typical of standard equipment and would not require unusual or energy-intensive methods. The Project would comply with the energy conservation requirements of the California Code of Regulations, including Title 13 Sections 2449 and 2485, which limit idling and require cleaner off-road engine standards, and Title 24, Part 11 (CALGreen), which establishes energy-efficient design and construction practices.

The Project would also include installation of an onsite photovoltaic solar system of up to 60 kilowatts, with associated wiring, conduits, an inverter, an electrical meter, and possible battery storage. The system would be made of approximately 4,500 square feet of panels, and it would provide renewable power for the replaced valve building and pumps and reduce reliance on non-renewable energy sources. Any on-site renewable energy generation would be consistent with the City's energy and climate policies, and would support consistency with Senate Bill 100, which requires transition to 100 percent clean electricity in California by 2045. Consequently, the Project would not result in significant irreversible environmental changes related to energy use. Impacts related to consumption of non-renewable resources would be less than significant.

The Project would not result in new traffic trips following construction or otherwise increase citywide vehicle miles traveled. As discussed in Section 4.2, *Air Quality,* and Section 4.6, *Greenhouse Gas Emissions*, the Project would not result in substantial air pollutants associated with vehicle trips, and would not generate significant regional air pollutant and greenhouse gas emissions. As stated in the Initial Study (Appendix A), the Project would not result in long-term increases in citywide vehicle miles traveled and is located in an area meeting the criteria for presuming a less than significant vehicle miles traveled impact. Accordingly, the Project's contribution to irreversible environmental effects would be less than significant.

6 Federal Cross-Cutting Environmental Regulations Evaluation

The City of Santa Barbara (City) is seeking funding under a State program with a federal funding component. As such, this Environmental Impact Report (EIR) includes analysis to support compliance with applicable federal environmental requirements, commonly referred to as federal cross-cutters. This section summarizes the Project's status with respect to relevant federal laws, executive orders, and policies, and identifies any consultation conducted or anticipated.

The topics addressed are based in part on the State Water Resources Control Board's (SWRCB) Federal Cross-Cutting Environmental Regulations Evaluation Form, which is used to document compliance for projects funded through the State Revolving Fund (SRF) Program, partially supported by the United States Environmental Protection Agency (USEPA).

The Project must demonstrate consistency with the following federal cross-cutters:

- Federal Endangered Species Act (FESA; Section 7)
- National Historic Preservation Act (NHPA; Section 106)
- General Conformity Rule for the Federal Clean Air Act (FCAA)
- Coastal Zone Management Act
- Farmland Protection Policy Act
- Executive Order 11988 – Floodplain Management
- Federal Migratory Bird Treaty Act, Bald and Golden Eagle Protection Act, and Executive Order 13168
- Executive Order 11990 – Protection of Wetlands
- Wild and Scenic Rivers Act
- Safe Drinking Water Act – Source Water Protection
- Executive Order on Trails for America in the 21st Century
- Executive Order 13007 – Indian Sacred Sites
- Magnuson-Stevens Fishery Conservation and Management Act

Federal Endangered Species Act

Section 7 of the FESA requires federal agencies, in consultation with the Secretary of the Interior, to ensure their actions do not jeopardize the continued existence of endangered or threatened species or result in the destruction or adverse modification of the critical habitat of these species. Under Section 7, a project that could result in incidental take of a listed threatened or endangered species must consult with the United States Fish and Wildlife Service to obtain a Biological Opinion. If the Biological Opinion finds the Project could jeopardize the existence of a listed species ("jeopardy opinion"), the agency cannot authorize the Project until it is modified to obtain a "non-jeopardy" opinion.

As informed by the Biological Resources Assessment (Appendix D) and summarized in Section 4.3, *Biological Resources*, of this Environmental Impact Report, plant communities and existing vegetation conditions within the Project site primarily consist of regularly mowed grassland, coast

live oak woodland, eucalyptus grove, sagebrush, and ice plant mat. Offsite improvements would occur entirely within paved public rights-of-way (ROW) in the Alta Mesa neighborhood. The Project site does not support federally listed wildlife species or designated critical habitat. All work on the Vic Trace Reservoir parcel would occur on a previously developed City-owned site, and offsite improvements would remain within disturbed roadway corridors. Therefore, the proposed Project would have no effect on federal special-status species under federal regulations and would be in compliance with FESA.

National Historic Preservation Act, Section 106

The purpose of the National Historic Preservation Act (NHPA) is to protect, preserve, rehabilitate, or restore significant historical, archaeological, and cultural resources. Section 106 requires federal agencies to take into account effects on historic properties. Section 106 review involves a step-by-step procedure described in detail in the implementing regulations (36 Code of Federal Regulations [CFR] Part 800). If federal funding or approvals are utilized, the City would define an Area of Potential Effects (APE) that includes the Vic Trace Reservoir parcel and the offsite improvements within the public ROW. A Historic Property Identification Report (HPIR) has been prepared for this Project and would be submitted by the federal lead agency (or SWRCB, as applicable) as part of consultation with the State Historic Preservation Officer (SHPO). Concurrence by SHPO would ensure compliance with NHPA.

The existing reservoir (constructed in 1956), valve building, and related site infrastructure have been previously disturbed and are utilitarian in character; based on the historic resources analysis in the Initial Study (Appendix A), there is no indication of eligibility for listing in the National Register of Historic Places. Similarly, offsite work is limited to buried utilities in paved streets with no historic properties anticipated within the APE. Accordingly, a finding of “no historic properties affected” or “no adverse effect” under Section 106 would be appropriate, pending SHPO consultation outcomes.

General Conformity Rule for the Federal Clean Air Act (FCAA)

The 1990 Amendment to Federal Clean Air Act (FCAA) Section 176 requires USEPA to promulgate rules to ensure federal actions conform to the appropriate State Implementation Plan (SIP). These rules, known as the General Conformity Rule (40 CFR Parts 51.850–51.860 and 93.150–93.160), require any federal agency responsible for an action in a federal nonattainment/maintenance area to demonstrate conformity to the applicable SIP, by either determining the action is exempt from the General Conformity Rule requirements or subject to a formal conformity determination.

The proposed Project is located within the city of Santa Barbara (South Central Coast Air Basin) and involves construction activities at the Vic Trace Reservoir parcel and along nearby public roadways (La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, Meigs Road) and a press reducing valve (PRV) station relocation near Dolores Drive/Meigs Road. Given the construction scope summarized in Chapter 2, *Project Description*, Section 2.7, *Project Construction*, and typical equipment fleets, Project emissions are expected to be below General Conformity *de minimis* thresholds. If a federal nexus is present, the lead agency would prepare a General Conformity applicability analysis; based on the information available, a formal conformity determination is not anticipated. Furthermore, the Project would comply with Santa Barbara County Air Pollution Control District rules and requirements.

Coastal Zone Management Act

The Coastal Zone Management Act (CZMA), passed by Congress in 1972 and managed by the National Oceanic and Atmospheric Administration's Office of Ocean and Coastal Resource Management, is designed to balance competing land and water issues in coastal zones. It also aims to "preserve, protect, develop, and where possible, to restore or enhance the resources of the nation's coastal zone." In California, CZMA consistency is administered through the California Coastal Act and local coastal programs. Project components are confined to the City-owned Vic Trace Reservoir parcel, 1633 La Coronilla, and nearby public ROW in the Alta Mesa neighborhood, which are not within the coastal zone.[1] Accordingly, CZMA consistency does not apply to the Project as described.

Farmland Protection Policy Act

The Farmland Protection Policy Act (FPPA) requires a federal agency consider the effects of its actions and programs on the nation's farmlands. The FPPA is intended to minimize the impact of federal programs with respect to the conversion of farmland to nonagricultural uses. It assures, to the extent possible, federal programs are administered to be compatible with State, local, and private programs and policies to protect farmland.

The Vic Trace Reservoir parcel is a developed municipal utility site with surrounding residential uses, 1633 La Coronilla is proposed for temporary construction offices and is of residential use, and offsite improvements are within paved public roadways; no Prime Farmland, Unique Farmland, Farmland of Statewide Importance, or Williamson Act lands occur in the Project footprint.[2,3] Therefore, the Project would not adversely affect farmland and would be in compliance with FPPA.

Executive Order 11988 – Floodplain Management

Executive Order (EO) 11988 requires federal agencies to recognize the values of floodplains, consider the public benefits from restoring and preserving floodplains, and evaluate the potential effects of any actions taken within a floodplain.

Most Project components are located on Lavigia Hill, with site elevations from approximately 463–465 feet above sea level, or in uphill residential streets, outside Federal Emergency Management Agency-mapped flood hazard areas. No new encroachments into undeveloped floodplains would occur, and the Project would not alter topography in a manner that could impede or redirect flood flows. The Project site is not located within a floodplain[4], and no structures would be placed in areas subject to inundation. The buried reservoirs and associated infrastructure would be designed to withstand storm events and would not obstruct natural drainage pathways. Therefore, the Project is consistent with EO 11988.

[3] California Department of Conservation. 2022. Williamson Act Enrollment Finder. https://maps.conservation.ca.gov/dlrp/WilliamsonAct/ (accessed January 2026).
[4] Federal Emergency Management Agency. 2018. FEMA's National Flood Hazard Layer (NFHL) Viewer. https://www.arcgis.com/apps/webappviewer/index.html?id=8b0adb51996444d4879338b5529aa9cd (accessed February 2026).

Federal Migratory Bird Treaty Act, Bald and Golden Eagle Protection Act, and Executive Order 13168

The Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act prohibit the take of migratory birds (or any part, nest, or eggs of any such bird) and the take and commerce of eagles. EO 13168 requires any project with federal involvement to address impacts of federal actions on migratory birds.

Vegetation removal at the Vic Trace Reservoir parcel, including up to approximately 55 trees, including seven coast live oaks, and any trimming near offsite work areas could overlap with the nesting season. In accordance with Mitigation Measure BIO-2, the City would implement standard nesting bird avoidance measures (e.g., pre-construction surveys by a qualified biologist, no-work buffers if active nests are found, seasonal timing or monitoring) to avoid take under MBTA and to comply with California Fish and Game Code. With these measures, the Project would be in compliance with these federal regulations.

Executive Order 11990 – Protection of Wetlands

Under EO 11990, federal agencies must avoid affecting wetlands unless it is determined no practicable alternative is available. The Project would consist of construction at the Vic Trace Reservoir parcel, located on Lavigia Hill and developed with existing utility facilities, temporary use of an existing residence at 1633 La Coronilla, as well as improvements along paved roadways. No federally protected wetlands occur within the Project footprint[5], and no discharge/fill in waters of the U.S. is proposed. Thus, the Project would be in compliance with EO 11990.

Wild and Scenic Rivers Act

The Wild and Scenic Rivers Act was passed in 1968 to preserve and protect designated rivers for their natural, cultural, and recreational value. There are no designated Wild and Scenic Rivers within the Project area[6], nor will any designated rivers be adversely affected by the Project. As a result, the Wild and Scenic Rivers Act does not apply to the Project.

Safe Drinking Water Act – Source Water Protection

Section 1424(e) of the Safe Drinking Water Act established the USEPA's Sole Source Aquifer Program. This program protects communities from groundwater contamination from federally-funded projects. No sole source aquifers occur beneath the Project site. Therefore, the Sole Source Aquifer Program does not apply, and the Project would be in compliance with Section 1424(e).

Executive Order 13195 – Trails for America in the 21st Century

EO 13195 on Trails for America requires federal agencies to protect, connect, promote, and assist trails of all types throughout the United States. No trails exist on the Project site. Therefore, no adverse effects on trails would occur, and the Project is in compliance with EO 13195.

[5] United States Fish and Wildlife Service. 2019. National Wetlands Mapper. https://fwsprimary.wim.usgs.gov/wetlands/apps/wetlands-mapper/ (accessed February 2026).

Executive Order 13007 – Indian Sacred Sites

Sacred sites are defined in EO 13007 as "any specific, discrete, narrowly delineated location on federal land identified by an Indian tribe, or Indian individual determined to be an appropriately authoritative representative of an Indian religion, as sacred by virtue of its established religious significance to, or ceremonial use by, an Indian religion; provided the tribe or appropriately authoritative representative of an Indian religion has informed the agency of the existence of such a site." The Project would not be located on or impact any federal lands and therefore would not affect any Native American sacred sites under this EO.

Magnuson-Stevens Fishery Conservation and Management Act

The Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act) of 1976 as amended (16 U.S.C. Section 1801 et seq.), is the primary act governing federal management of fisheries in federal waters, from the 3-nautical-mile state territorial sea limit to the outer limit of the United States Exclusive Economic Zone. It establishes exclusive United States' management authority over all fishing within the Exclusive Economic Zone, all anadromous fish throughout their migratory range except when in a foreign nation's waters, and all fish on the continental shelf. The Act also requires federal agencies to consult with NMFS on actions which could damage Essential Fish Habitat, as defined in the 1996 Sustainable Fisheries Act (Public Law 104-297).

The Project would not be located in or impact any United States federal waters regulated under the Magnuson-Stevens Act. Thus, the Project would be in compliance with the Magnuson-Stevens Act.

7 Alternatives

7.1 Introduction

Section 15126.6 of the *California Environmental Quality Act (CEQA) Guidelines* provides guidance for the identification and evaluation of project alternatives in an Environmental Impact Report (EIR). The *CEQA Guidelines* state that an "EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project and evaluate the comparative merits of the alternatives."

As required by Section 15126.6 of the *CEQA Guidelines*, this EIR examines a range of reasonable alternatives to the Project that would avoid or substantially lessen the significant and unavoidable and/or significant but mitigable impacts of the Project, and would attain most of the following Project objectives:

- Replace and upgrade aging water infrastructure to ensure safe and reliable drinking water;
- Improve existing facilities and install new facilities to enhance the operational reliability and resiliency, minimize the risk of future facility failures, and optimize hydraulics and operations of Vic Trace Reservoir and the City's water system;
- Maintain critical demand capacity (e.g., peak demands, structure fires, human consumption) and system pressure city-wide;
- Address updated federal regulations that require more robust security for water infrastructure; and
- Maintain the City's ability to store a large amount of water locally, which is a key element of Santa Barbara's strategy to remain resilient and resistant to local emergencies or other climate change-related issues (e.g., drought, storms, wildfires).

7.2 Project Alternatives

This discussion focuses on alternatives to the Project, including alternatives which were considered but ultimately rejected from further evaluation. These alternatives have been selected for their ability to substantially reduce or eliminate one or more of the significant adverse impacts associated with the Project while still meeting most of the basic Project objectives. This EIR also evaluates a No Project Alternative, consistent with the *CEQA Guidelines* Section 15126.6(e).

7.2.1 Alternatives Considered but Rejected from Further Evaluation

Section 15126.6(c) of the *CEQA Guidelines* requires that an EIR identify alternatives that were considered but rejected as infeasible and provide a brief explanation as to why such alternatives were not fully considered in the EIR. As required by the *CEQA Guidelines*, the selection of alternatives for this EIR included a screening process to determine a reasonable range of alternatives, which could reduce significant effects but also feasibly meet Project objectives. Alternatives that do not clearly provide any environmental advantages compared to the Project, do not meet basic Project objectives, or do not achieve overall lead agency policy goals, have been

eliminated from further consideration. The factors that may be considered when addressing the feasibility of alternatives include site suitability, economic viability, availability of infrastructure, General Plan consistency, other plans or regulatory limitations, jurisdictional boundaries, and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site (*State CEQA Guidelines*, Section 15126.6[f][1]).

CEQA Guidelines Section 15126.6(a) also states that "an EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation." The alternatives shall be limited to those that would avoid or substantially lessen any of the significant effects of the Project. Of those alternatives, the EIR need examine in detail only the ones that the lead agency determines could feasibly attain most of the basic objectives of the Project. Other alternatives may be considered but are not required to satisfy the requirements of CEQA.

For the Project, characteristics used to reject alternatives from further consideration include:

- Failure to meet basic Project objectives;
- Limited effectiveness in reducing Project environmental impacts;
- Inconsistency with City policies; and
- Potential for inconsistency with adopted agency plans and policies.

The following alternatives were considered but eliminated from further analysis by the City due to one or more of these factors.

Alternative Location

The first step in considering an off-site alternative is identifying whether any of the significant impacts of the Project would be avoided or substantially lessened by the relocation. Only locations that would avoid or substantially lessen any of the significant impacts of the Project need be considered for inclusion in the EIR (*CEQA Guidelines* Section 15126.6[f][2][A]). If it is determined that no feasible alternative locations exist, the EIR must disclose the reasons for this conclusion (*CEQA Guidelines* Section 15126.6[f][2][B]).

No alternative properties for implementation of the Project are analyzed in this EIR. The Project would involve replacement and modernization of an existing potable water storage facility that is an integral component of the City of Santa Barbara's distribution system. Because water storage facilities must operate within a defined hydraulic zone, potential alternative sites are limited to areas with appropriate hydraulic elevation, existing system connectivity, and sufficient geotechnical stability to support reservoir construction.

Furthermore, relocating the Project to an off-site location would also impede the ability to meet several Project objectives, including replacing aging critical infrastructure at the Vic Trace site; improving seismic resilience of the existing system; and ensuring adequate operational storage within the existing hydraulic zone without constructing extensive new pipelines or pump stations. As a result of these considerations, off-site alternative locations were evaluated and rejected as infeasible, consistent with *CEQA Guidelines* Section 15126.6(c).

Replacement with Single Reservoir

Under this alternative, the existing Vic Trace Reservoir would be demolished and replaced with a single 10-million-gallon (MG) reservoir rather than two 5-MG reservoirs. While this alternative could

potentially meet basic storage and operational capacity needs, it was ultimately rejected from further consideration because it would not achieve several of the fundamental Project objectives.

A single 10-MG reservoir would not meet the Project objective of enhancing system resiliency and minimizing the risk of future facility failures. Operation of the City's potable water distribution system relies heavily on redundancy to ensure continued service during maintenance activities, seismic events, equipment failures, or other unplanned outages. With only one reservoir, any scheduled or emergency repairs would require the entire facility to be taken offline, eliminating critical operational storage for the duration of the outage. This would expose the system to heightened vulnerability during emergencies, reduce operational flexibility, and undermine the City's ability to maintain adequate water supply and pressure for customers and fire protection. Therefore, this alternative was considered but rejected from detailed evaluation in the EIR, consistent with *CEQA Guidelines* Section 15126.6(c).

7.2.2 Description of Alternatives Evaluated

This analysis considers the following two alternatives to the proposed Project:

- Alternative 1: No Project Alternative
- Alternative 2: Roof Replacement Only

Each of these alternatives is described below. The potential environmental effects of each of these alternatives in comparison to the proposed Project is described in Section 7.3.

7.2.2.1 Alternative 1: No Project Alternative

The purpose of describing and analyzing a no project alternative is to allow decision-makers to compare the impacts of approving the proposed Project with the impacts of not approving the proposed Project. According to *CEQA Guidelines* Section 15126.6(e)(3)(C), the lead agency should analyze the impacts of the no project alternative by projecting what would reasonably be expected to occur in the foreseeable future if the Project were not approved. The No Project Alternative assumes that the proposed Project is not approved and Project improvements are not pursued. The existing Project site would be maintained, and Vic Trace Reservoir operations would continue, unchanged compared to existing conditions; however, maintenance needs could increase over time as components of the aging system deteriorate or require repair or replacement. The No Project Alternative would not redevelop the Vic Trace Reservoir parcel (including replacement of the existing reservoir with two new reservoirs, oil well re-abandonment, building replacements, and landscaping), would not replace, repair, abandon, or relocate aging water mains in neighborhood areas near the Vic Trace Reservoir parcel, and would not relocate the Vic Trace Reservoir's downstream pressure reducing valve (PRV) station to an improved location with safer entry.

7.2.2.2 Alternative 2: Roof Replacement Only

Alternative 2, Roof Replacement Only, assumes that the existing Vic Trace Reservoir would remain in service and only the roof of the existing reservoir would be replaced. No additional improvements included in the proposed Project, such as construction of the two new reservoirs, re-abandonment of the existing oil well, replacement of onsite buildings, installation of new landscaping, relocation of the downstream PRV station, or replacement, repair, abandonment, or relocation of aging water mains in the surrounding neighborhood would occur. Under Alternative 2, operation and maintenance activities at the Vic Trace Reservoir parcel would be the same as existing conditions,

with the exception of increased operations and maintenance activities due to increasing repair and maintenance needs.

7.3 Alternatives Impact Analysis

7.3.1 Alternative 1: No Project Alternative

a. Aesthetics

Under the No Project Alternative, no construction, demolition, or installation of new features would occur on the Vic Trace Reservoir parcel. Therefore, there would be no potential for activities that could generate new sources of light or glare. Existing lighting at the Vic Trace Reservoir parcel would continue to operate as under existing conditions. As described in Section 4.1, *Aesthetics*, current lighting conditions in the vicinity of the Project site are typical of suburban neighborhoods, and the Project site's existing daytime glare comes from reflective surfaces such as architectural materials and the reservoir metallic roof. Because no solar panels or other new reflective materials would be installed, the No Project Alternative would avoid the Project's glare impact associated with the introduction of solar panels. Therefore, the No Project Alternative would have no impact involving the creation of new sources of light and glare, which would be a lesser level of impact than the proposed Project.

b. Air Quality

The No Project Alternative would not include construction or demolition activities, including construction vehicle trips, that could emit criteria air pollutants. Operation and maintenance of the Vic Trace Reservoir under the No Project Alternative would maintain existing conditions, similar to the proposed Project. Overall, the No Project Alternative would have no impact involving generation of criteria pollutant emissions, which would be a lesser level of impact than the proposed Project.

Under the No Project Alternative, there would be no construction or demolition activities or construction vehicle trips to the Project site that could expose sensitive receptors to pollutants. The Project would require Mitigation Measure AQ-1, whereas the No Project Alternative would require no such mitigation. The No Project Alternative would have no impact involving exposure of sensitive receptors to substantial pollutant concentrations, which would be a lesser level of impact than the proposed Project.

c. Biological Resources

The No Project Alternative would not include any construction activities on the Project site and therefore would have no potential to impact special-status plant and wildlife species or sensitive natural communities. Because the No Project Alternative would not include any construction activities, including tree removals, on the Project site, the No Project Alternative has no potential to conflict with local policies or ordinances protecting biological resources, and no impact would occur. The Project would require Mitigation Measures BIO-1 through BIO-6 whereas the No Project Alternative would require no such mitigation. Overall, the No Project Alternative would have no impact on biological resources, which would be a lesser level of impact than the proposed Project.

d. Cultural and Tribal Cultural Resources

The No Project Alternative would not involve ground-disturbing activities that could potentially damage or disturb subsurface archaeological resources or tribal cultural resources. The Project would require Mitigation Measures CUL-1 through CUL-3, whereas the No Project Alternative would require no such mitigation. The No Project Alternative would have no impact on archaeological resources and tribal cultural resources, which would be a lesser level of impact than the proposed Project.

e. Geology and Soils

The No Project Alternative would not involve construction activities, such as grading, that would increase the potential for erosion and sedimentation. Under the No Project Alternative, existing drainage patterns on the Project site would be maintained, and the No Project Alternative would not result in new sources of runoff that could contribute to Project site erosion. Although existing soil erosion and drainage deficiencies on the Project site would continue under the No Project Alternative, the No Project Alternative would not exacerbate these conditions or introduce new erosion hazards. Therefore, the No Project Alternative would have no impact involving substantial soil erosion or the loss of topsoil, which would be a lesser level of impact than the proposed Project.

The No Project Alternative would not involve ground-disturbing activities that could potentially damage or disturb unanticipated paleontological resources would occur. The Project would require Mitigation Measure GEO-1 and GEO-2, whereas the No Project Alternative would require no such mitigation. The No Project Alternative would have no impact involving paleontological resources, which would be a lesser level of impact than the proposed Project.

f. Greenhouse Gas Emissions

The No Project Alternative would not result in construction activities or additional vehicle trips than what is already occurring that could emit greenhouse gas (GHG) emissions. The No Project Alternative would have no impact involving GHG emissions, which would be a lesser level of impact than the proposed Project.

The No Project Alternative does not involve construction activities that would increase GHG emissions and therefore would not have the potential to conflict with existing policies or regulations established to reduce GHG emissions. The No Project Alternative would not include the installation of solar panels at the Vic Trace Reservoir parcel, which is aligned with existing policies or regulations established to reduce GHG emissions. Nevertheless, the No Project Alternative would not increase GHG emissions and would have no impact related to conflicts with existing policies or regulations established to reduce GHG emissions, which would be a lesser level of impact than the proposed Project.

g. Hazards and Hazardous Materials

The No Project Alternative would not involve construction activities at the Project site and consequently would not have the potential to disturb hazardous materials within the existing Project site buildings. Under the No Project Alternative, the existing oil well would remain in its current condition. Therefore, the No Project Alternative would have no impact involving the accidental release of hazardous materials, which would be a lesser level of impact than the proposed Project.

h. Noise

The No Project Alternative would not involve demolition or construction, including grading and excavation, that could result in the generation of construction noise levels that exceed City of Santa Barbara or Federal Transit Administration standards. The Project would require Mitigation Measure NOI-1, whereas the No Project Alternative would require no such mitigation. The No Project Alternative would have no impact involving generation of a substantial temporary increase in ambient noise levels, which would be a lesser level of impact than the proposed project.

The No Project Alternative would maintain existing on-site conditions and would not introduce new structures or features that could result in increases in operational noise. The Project would require Mitigation Measure NOI-2, whereas the No Project Alternative would require no such mitigation. The No Project Alternative would have no impact involving generation of a substantial permanent increase in ambient noise levels, which would be a lesser level of impact than the proposed project.

The No Project Alternative would maintain existing on-site conditions and would not introduce new vehicle trips to and from the Project site. Therefore, the No Project Alternative would have no impact involving generation of a substantial permanent increase in ambient noise levels due to vehicle trips, which would be a lesser level of impact than the proposed Project.

The No Project Alternative would not involve new construction near residences and would not result in any potential to affect nearby buildings due to construction-related groundborne vibration. The Project would require Mitigation Measure NOI-3, whereas the No Project Alternative would require no such mitigation. The No Project Alternative would have no impact involving groundborne vibration, which would be a lesser level of impact than the proposed Project.

Based on the above, the No Project Alternative would have no impact related to noise. The No Project Alternative's noise impacts would be a lesser level of impact than the proposed Project.

i. Transportation

The No Project Alternative would not involve any changes to the existing circulation network at or surrounding the Project site and would not include any construction activities at the project site that could result in conflict with a local plan, policy, or ordinance affecting the circulation network. The Project would require Mitigation Measure TRA-1, whereas the No Project Alternative would require no such mitigation. Overall, the No Project Alternative would have no impact on transportation and circulation, which would be a lesser level of impact than the proposed Project.

j. Utilities and Service Systems

The No Project Alternative would not require construction activities and therefore would not increase solid waste generation compared to existing conditions. Accordingly, the No Project Alternative would have no impact related to solid waste generation, which would be a lesser level of impact than the proposed Project.

7.3.2 Alternative 2: Roof Replacement Only

a. Aesthetics

Under Alternative 2, limited construction activity would occur on the Vic Trace Reservoir parcel, consisting solely of replacing the roof of the existing reservoir. No new buildings, utilities, landscaping, or other above-ground features would be added to the Project site, and no solar panels

or additional other reflective materials would be installed. Because construction would be restricted to the replacement of an existing component of an existing structure, Alternative 2 would not introduce new lighting fixtures or additional reflective surfaces that could generate new sources of light or glare. Existing lighting at the Vic Trace Reservoir parcel would continue to operate under existing conditions, and ambient lighting in the surrounding neighborhood would remain consistent with the suburban context.

Operational glare conditions at the Project site currently arise from reflective architectural materials and surfaces already present. Under Alternative 2, the reservoir's overall surface reflectivity would remain substantially similar to existing conditions.

While minor, temporary glare from construction equipment could occur during roof replacement, such glare would be intermittent, short-term, and substantially less than the temporary construction-related glare associated with the proposed Project, which involves larger construction zones, more equipment, and longer construction duration. No nighttime construction lighting is anticipated for Alternative 2, and any temporary safety lighting required would be limited, shielded, and confined to the immediate work area.

Therefore, Alternative 2 would have a less than significant impact involving the creation of new sources of light and glare, and would result in the same level of impact than the proposed Project.

b. Air Quality

Under Alternative 2, construction activity on the Vic Trace Reservoir parcel would be limited to replacement of the existing reservoir roof. Alternative 2 would involve a smaller construction footprint, a shorter activity window, and substantially fewer construction vehicle trips. As a result, emissions of criteria air pollutants generated during construction would be reduced compared to the proposed Project. Given that construction of the proposed Project would not exceed Santa Barbara Air Pollution Control District emissions thresholds, Alternative 2's reduced construction would also not exceed such thresholds. Alternative 2 would not change existing operational conditions at the Project site, and thus would not result in an increase in long-term operational emissions. Alternative 2's impacts related to release of criteria air pollutants would be reduced compared to the proposed Project but would remain less than significant.

Because Alternative 2 would limit construction to replacement of the existing reservoir roof, Alternative 2's construction would result in less toxic air contaminant emissions on the Project site compared to the proposed Project. However, construction vehicle trips associated with reservoir roof replacement may result in toxic air contaminant emissions that exceed Santa Barbara County Air Pollution Control District thresholds. Similar to the proposed Project, implementation of Mitigation Measure AQ-1 would be required. In contrast to the proposed Project, which would introduce a new generator on-site, operation of Alternative 2 would not involve the use of equipment that would increase toxic air contaminant emissions on the Project site. Overall, Alternative 2's impacts related to the release of toxic air contaminants would be reduced compared to the proposed Project and would be less than significant with mitigation incorporated.

c. Biological Resources

Alternative 2 would limit construction activity on the Vic Trace Reservoir parcel to replacement of the existing reservoir roof. No grading, vegetation removal, trenching, or off-site construction would occur. As a result, Alternative 2 would not disturb habitat, remove trees, or alter vegetation that could support special-status plant or wildlife species. Operational conditions, including Project site

lighting, human activity, and maintenance frequency, would remain consistent with existing conditions.

Because Alternative 2 would avoid the ground disturbance and vegetation removal associated with the proposed Project, it would mostly avoid the Project's potential for direct or indirect impacts on special-status species and sensitive natural communities. However, there is potential for construction activities associated with reservoir roof replacement to impact nesting bird activity. Similar to the proposed Project, Mitigation Measure BIO-2 would be required. Overall, Alternative 2's impacts related to biological resources would be reduced compared to the proposed Project and would be less than significant with mitigation incorporated. In contrast to the proposed Project, implementation of Mitigation Measures BIO-1 and BIO-3 through BIO-6 would not be required.

d. Cultural and Tribal Cultural Resources

Alternative 2 would not involve excavation, trenching, or other ground-disturbing construction beyond limited work on the existing reservoir roof. Because all work would occur on an existing structure and would not disturb subsurface soils, Alternative 2 would not encounter or damage archaeological resources or tribal cultural resources. Alternative 2's impacts related to archaeological resources or tribal cultural resources would be reduced compared to the proposed Project and would be less than significant. In contrast to the proposed Project, implementation of Mitigation Measures CUL-1 through CUL-3 would not be required.

e. Geology and Soils

Under Alternative 2, no grading, excavation, or soil disturbance would occur, and no changes would be made to drainage patterns or surface runoff characteristics. Roof replacement activities would take place entirely within the footprint of the existing reservoir structure and would not involve earthwork. If roof replacement activities under Alternative 2 were to result in a substantial change to roof design or drainage characteristics, limited on-site stormwater improvements could be required. Alternative 2 would not increase the potential for erosion, sediment transport, or topsoil loss. Alternative 2 would have no impact regarding soil erosion or topsoil loss, which is a reduced level of impact when compared to the proposed Project.

In addition, because subsurface conditions would remain undisturbed, Alternative 2 would not create the potential to damage or uncover previously unknown paleontological resources. Alternative 2's impacts related to paleontological resources would be reduced compared to the proposed Project and would be less than significant. In contrast to the proposed Project, implementation of Mitigation Measure GEO-1 and GEO-2 would not be required.

f. Greenhouse Gas Emissions

Alternative 2 would involve only short-duration roof replacement activities, generating a smaller volume of construction-related GHG emissions than the proposed Project. No new operational emissions would occur because site operations, maintenance practices, and vehicle usage would remain unchanged from existing conditions. Alternative 2's impacts related to generation of GHG emissions would be reduced compared to the proposed Project and would be less than significant.

Additionally, because Alternative 2 would not introduce new structures, electrified equipment, or solar panels, it would not conflict with applicable state or local GHG reduction plans. Alternative 2 would not include the installation of solar panels at the Vic Trace Reservoir parcel, which is aligned with existing policies or regulations established to reduce GHG emissions. Nevertheless, Alternative

2 would not increase GHG emissions and would have no impact related to conflicts with existing policies or regulations established to reduce GHG emissions, which would be a lesser level of impact than the proposed Project.

g. Hazards and Hazardous Materials

Because Alternative 2 would not include demolition, earthwork, or construction outside the reservoir footprint, it would not disturb soils or structures that may contain hazardous building materials. Under Alternative 2, the existing oil well would remain in its current condition. Roof replacement activities could require handling limited hazardous materials, but these materials would be used in small quantities and under existing regulatory requirements for safe handling, storage, and disposal. Alternative 2's impacts related to the accidental release of hazardous materials would be reduced compared to the proposed Project and would be less than significant.

h. Noise

Under Alternative 2, construction would be limited to replacement of the existing reservoir roof. Roof replacement would be short-duration, localized to the existing reservoir, and would involve far fewer pieces of equipment and vehicle trips than the proposed Project. As a result, Alternative 2 would substantially reduce the potential for temporary construction noise increases relative to the proposed Project. Because Alternative 2 would not include grading, off-site utility work, and nighttime construction, its temporary construction noise would be lower and shorter in duration than the proposed Project. Given the limited scope and the ability to comply with the City's permitted construction hours (7 a.m.–8 p.m.), Alternative 2's construction noise and construction-traffic noise would be less than significant. In contrast to the proposed Project, Alternative 2 would not require implementation of Mitigation Measure NOI-1, and impacts would be reduced when compared to the proposed Project.

The proposed Project's operational noise exceedances are driven by emergency generators that could surpass the City's 53 dBA mechanical equipment limit at multiple receptors. Alternative 2 would not add generators, pumps, or other new stationary mechanical equipment, and therefore would avoid the Project's operational noise sources. Routine site operations and staff visits would remain as under existing conditions, and Alternative 2 would not increase off-site operational traffic. Accordingly, Alternative 2 would have no operational noise impact. In contrast to the proposed Project, Alternative 2 would not require implementation of Mitigation Measure NOI-2, and impacts would be reduced when compared to the proposed Project.

The proposed Project's vibration concern arises primarily from the use of a vibratory roller, which can exceed the damage threshold for older residential structures. Alternative 2 would not require paving/compaction with a vibratory roller, deep foundation activities, or other heavy equipment that generates high vibration levels; rather, work would occur on the existing reservoir structure. Accordingly, Alternative 2 would have a less than significant vibration impact. In contrast to the proposed Project, Alternative 2 would not require implementation of Mitigation Measure NOI-3, and impacts would be reduced when compared to the proposed Project.

i. Transportation

Alternative 2 would not modify the existing circulation network, introduce new access roads, or require temporary lane closures. Construction activity would be limited to periodic worker vehicle trips associated with roof replacement, which would be fewer than the construction trips associated with the proposed Project and would not affect traffic flow or emergency access. No operational

changes in traffic levels or patterns would occur. Alternative 2's impacts related to transportation would be reduced compared to the proposed Project and would be less than significant. In contrast to the proposed Project, implementation of Mitigation Measure TRA-1 would not be required.

j. Utilities and Service Systems

Alternative 2 would not require trenching, infrastructure installation, or utility relocations. Construction activity would be minimal and would not generate substantial solid waste beyond roofing material removed and replaced. These limited waste volumes would be well-accommodated by existing disposal capacity. Operational solid waste generation would remain unchanged from existing conditions. Alternative 2's impacts related to solid waste would be reduced compared to the proposed Project and would be less than significant.

7.4 Environmentally Superior Alternative

Table 7-1 indicates whether each alternative's environmental impact is greater than, less than, or similar to that of the proposed Project for each of the issue areas studied. Based on the alternatives analysis provided above, Alternative 1 (No Project Alternative) would be the environmentally superior alternative.

Under the No Project Alternative, the proposed Project would not be approved and existing conditions at the Vic Trace Reservoir parcel and surrounding neighborhood streets would continue unchanged. No construction would occur, and no new facilities or lighting would be installed. As a result, the No Project Alternative would avoid the Project's construction-related impacts and would not introduce new operational sources of impacts. Specifically, the No Project Alternative would not introduce solar panels that could create new sources of glare; would not involve ground disturbance with the potential to impact archaeological resources, tribal cultural resources, or paleontological resources; and would not result in construction noise in exceedance of applicable thresholds. This alternative would avoid potentially significant impacts to aesthetics, air quality, biological resources, cultural and tribal cultural resources, geology and soils, noise, and transportation. Mitigation Measures AQ-1, BIO-1 through BIO-6, CUL-1 through CUL-3, GEO-1 and GEO-2, NOI-1 through NOI-3, and TRA-1 would not be required. However, this alternative would not meet any of the Project objectives.

If the No Project Alternative is the environmentally superior alternative, CEQA requires that an environmentally superior alternative among the remaining alternatives be identified (*CEQA Guidelines* Section 15126.6[e]). Based on this consideration, Alternative 2 would be the environmentally superior alternative. Compared to the proposed Project, Alternative 2 would result in reduced impacts to aesthetics, air quality, biological resources, cultural and tribal cultural resources, geology and soils, greenhouse gas emissions, hazards and hazardous materials, noise, transportation, and utilities and service systems. However, Alternative 2 would not meet the following Project objectives to the same extent as the proposed Project:

- Replace and upgrade aging water infrastructure to ensure safe and reliable drinking water.
- Maintain the City's ability to store a large amount of water locally, which is a key element of Santa Barbara's strategy to remain resilient and resistant to local emergencies or other climate change-related issues (e.g., drought, storms, wildfires).

Alternative 2 would fail to meet the following Project objectives:

- Improve existing facilities and install new facilities to enhance the operational reliability and resiliency, minimize the risk of future facility failures, and optimize hydraulics and operations of Vic Trace Reservoir and the City's water system.
- Maintain critical demand capacity (e.g., peak demands, structure fires, human consumption) and system pressure city-wide.
- Address updated federal regulations that require more robust security for water infrastructure.

Table 7-1 Impact Comparison of Alternatives

Issue	Proposed Project Impact Classification	Alternative 1: No Project Alternative	Alternative 2: Roof Replacement Only
Aesthetics	Less than Significant	+	+
Air Quality	Less than Significant with Mitigation	+	+
Biological Resources	Less than Significant with Mitigation	+	+
Cultural and Tribal Cultural Resources	Less than Significant with Mitigation	+	+
Geology and Soils	Less than Significant with Mitigation	+	+
Greenhouse Gas Emissions	Less than Significant	+	+
Hazards and Hazardous Materials	Less than Significant with Mitigation	+	+
Noise	Significant and Unavoidable	+	+
Transportation	Less than Significant with Mitigation	+	+
Utilities and Service Systems	Less than Significant	+	+

+ Superior to the proposed project (reduced level of impact)

- Inferior to the proposed project (increased level of impact)

= Similar level of impact to the proposed project

INITIAL STUDY/ENVIRONMENTAL CHECKLIST

PROJECT TITLE:	Vic Trace Reservoir Replacement Project
APPLICATION NUMBER:	PRE2025-0035
DATE:	Thursday, November 13, 2025

APPLICANT/ PROPERTY OWNER

Applicant: City of Santa Barbara, Public Works Department

Applicant Representative(s): Kelly Bourque, Senior Project Engineer

Owner(s): City of Santa Barbara

PROJECT ADDRESS/LOCATION

The Project site encompasses the Vic Trace Reservoir parcel and various water infrastructure improvements in the Alta Mesa neighborhood in the City of Santa Barbara, California.

The Vic Trace Reservoir parcel covers approximately 15 acres (14.726 acres) and is located on City-owned property at 740 Dolores Drive, Santa Barbara (Assessor's Parcel Number [APN] 035-033-031). The parcel contains existing water infrastructure facilities, existing City communication facilities, and La Coronilla Park. Access to the Vic Trace Reservoir parcel is from La Coronilla Drive between residences at 1617 and 1633 La Coronilla Drive via an existing 20-foot-wide easement through the 1617 La Coronilla Drive property.

Underground water main pipeline (main) work is proposed within the public right-of-way (ROW) paved roadways near the Vic Trace Reservoir Parcel, including La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road. For a tabular summary of the Project components, refer to Table 1 Location of Project Components.

Table 1 Location of Project Components

Project Components	Location
Vic Trace Reservoir Parcel Improvements	
Vic Trace Reservoir Parcel Improvements and Reservoir Replacement	740 Dolores Drive, Santa Barbara (APN 035-033-031)
Offsite Improvements	
Relocated La Coronilla Transmission Main	Public ROW in roadway from intersection of Meigs Road westward to Vic Trace Reservoir driveway entrance
Replaced Vic Trace Outlet Water Main	Public ROW in roadway from Vic Trace Reservoir driveway entrance west along La Coronilla Drive, then south along Dolore Drive to the intersection of Meigs Road and Dolores Drive, then south on Meigs Road to Red Rose Way
Replaced Dolores Drive Water Main	Public ROW in road from intersection of La Coronilla Drive and Dolores Drive southwest towards Meigs Road
New Ricardo Avenue Water Main	Public ROW in roadway from the intersection of Dolores Drive and Ricardo Avenue westward towards La Vista Del Oceano
Entry/Exit Pits for La Vista Del Oceano Water Main Lining	Public ROW in roadway – temporary entry pit located in roadway at 652 Ricardo Avenue, temporary exit pit located in roadway west of 1528 La Vista Del Oceano
Existing PRV Station (to be abandoned)	Public ROW in roadway west of 1521 La Vista Del Oceano
Proposed PRV Station (to be constructed)	Public ROW east of intersection of Dolores Drive and Meigs Road on Dolores Drive between curb and private property at 1740 Cliff Drive

ROW = right of way
Main = water pipeline
PRV = pressure regulating valve

Construction access routes are described in *Construction Staging and Traffic*.

Figure 1 Regional Location, displays the regional location of the Project site, and Figure 2 Project Site Location, displays the location within a neighborhood context. Figure 3 Topographic Map shows a topographic map of the Project site.

Basemap provided by National Geographic Society, Esri, and their licensors © 2025. Santa Barbara Quadrangle. T04N R27W S21,28.
The topographic representation depicted in this map may not portray all of the features currently found in the vicinity today and/or features depicted in this map may have changed since the original topographic map was assembled.

PROJECT DESCRIPTION

Project Objectives

Originally constructed in 1956, Vic Trace Reservoir is the City of Santa Barbara's largest water storage reservoir. It serves as a vital component of the City's water distribution system, serving nearly 60,000 people or approximately 70% of Santa Barbara's population.

In 2021, the City's Water Distribution Infrastructure Plan (WDIP) developed recommendations to address the City's water distribution and supply needs through 2050. The WDIP recommended replacement of Vic Trace Reservoir due to its age, increasing repair needs, and importance to the City's overall water storage portfolio. Related offsite water infrastructure improvements in the Alta Mesa neighborhood were also identified to replace aging infrastructure, improve water system hydraulics, and address worker safety issues (safe facility ingress and egress).

Pursuant to CEQA Guidelines Section 15124(b), an Environmental Impact Report (EIR) shall contain a statement of objectives sought by the proposed Project. The objectives of the proposed Project include the following:

- Replace and upgrade aging water infrastructure to ensure safe and reliable drinking water;
- Improve existing facilities and install new facilities to enhance the operational reliability and resiliency, minimize the risk of future facility failures, and optimize hydraulics and operations of Vic Trace Reservoir and the City's water system;
- Maintain critical demand capacity (e.g., peak demands, structure fires, human consumption) and system pressure city-wide;
- Address updated federal regulations that require more robust security for water infrastructure; and
- Maintain the City's ability to store a large amount of water locally, which is a key element of Santa Barbara's strategy to remain resilient and resistant to local emergencies or other climate change-related issues (e.g., drought, storms, wildfires).

Project Characteristics

The proposed Project includes the following main elements:

- **Vic Trace Reservoir Parcel Improvements:** Replacement of the existing 10 million gallon (MG) Vic Trace Reservoir with two 5 MG reservoirs at the same site, re-abandonment of the abandoned oil well, building replacements, earthwork, and site improvements on the parcel, including possible renewable energy generation and storage.
- Offsite Improvements:
  - **Underground Water Mains:** Replacements, repairs, abandonments, and relocations of aging water mains in neighborhood areas near the Vic Trace Reservoir parcel.
  - **Underground Pressure Regulating Valve (PRV) Station Relocation**: Relocation of the reservoir's downstream PRV station to an improved location with safer entry.

Project elements are described in detail in the following sections. Figure 4 shows the proposed overall site plan for the Vic Trace Reservoir parcel. Figure 5 shows the proposed landscape plan. Figure 6 and Figure 7 show visual renderings of the proposed Project improvements (at preliminary design phase) on the Vic Trace Reservoir parcel.

Rendering 4. Rendering view of La Coronilla Park after Project implementation, facing east.

Vic Trace Reservoir Parcel Improvements

Vic Trace Reservoir Replacement

The proposed Project would demolish the existing 10 MG Vic Trace Reservoir and construct two identical, circular, prestressed concrete 5 MG reservoirs, shifted 30 feet northeast of the current reservoir's centerline and completely buried with 1.5 feet of cover. The installation of two reservoirs, rather than a single 10 MG reservoir, would provide the City with greater operational flexibility by allowing one reservoir to be taken offline for maintenance or seasonal cycling while maintaining uninterrupted service. This approach enhances water quality by reducing water age and improving turnover within the storage system.

Due to the slope of the reservoir area, the northwest- and southwest-facing sides of the reservoir area would be exposed with support from retaining walls, creating a lower terrace. The retaining walls would be approximately five to fifteen feet in height. The site's existing top (highest) ground surface would be lowered from its existing 465 feet above sea level to 463 feet above sea level.

The new reservoirs would each have an inside diameter of 206 feet and a side water depth of approximately 20 feet. The roofs would be column-supported conventionally reinforced flat slab. Following reservoir construction, backfill would be placed against the walls. The tops of both reservoirs would be covered with permeable finished surfaces (e.g., aggregate base or gravel).

Reservoir design and construction is governed by multiple codes and consensus standards, including the latest versions of the California Building Code and International Building Code, California Code of Regulations (Title 17 and 22), and American Water Works Association (AWWA) Standards.

The two new reservoirs would be separated by approximately 20 feet to provide sufficient space for the construction of inlet and outlet pipelines between the two reservoirs. Separate inlet and outlet pipelines would be installed on opposite sides of the reservoirs to minimize short-circuiting and stagnation of the water flow. Inlet, outlet, overflow, and drain pipelines would consist of cement mortar lined and coated welded steel pipes. The inlet and outlet pipelines would be equipped with isolation valves allowing removal of one or both reservoirs from service for repairs and maintenance.

Access to reservoir valves would be through two cast-in-place concrete vault structures, completely buried, except for hatches at the ground surface for personnel access to the staircases and for valve/equipment access. The proposed valve vaults would conform to modern Occupational Health and Safety Administration (OSHA) standards and would provide safer and more ergonomic access for operators in comparison to existing conditions.

- The Inlet Valve Vault would be located southeast and centered between the two reservoirs, and would be approximately 24 feet long, 24 feet wide, and 37 feet 11 inches deep.
- The Outlet Valve Vault would be located northwest and centered between the two reservoirs, and would be approximately 28 feet long, 24 feet wide, and 28 feet deep.

Proposed appurtenances for each vault would include roof vents, interior staircases, two access hatches on the roof (one for personnel entry and one for equipment), and guardrails around each roof hatch. Additional appurtenances may also be proposed for remote reservoir monitoring and water quality equipment.

The proposed Project would also install a replacement 8-inch water pipeline with adequate pressure for reservoir washdown water, fire hydrants, and irrigation. This replacement reservoir overflow and drain pipeline would operate similar to existing conditions, discharging water through the property via a

replaced 30-inch pipeline to an existing storm drain manhole at La Coronilla Park, which connects to an existing to an underground City storm drain system along Dolores Drive.

Site Access

A new 24-foot-wide asphalt concrete paved access road would be constructed from La Coronilla Drive to the top of the reservoir site to facilitate large vehicles and two-way traffic under normal operations. The improved access road would be located approximately over the existing access road alignment.

As shown in the visual renderings in Figure 7, one 30-foot-wide manual swinging wrought iron gate would be located along this access road, just before the paved area widens for parking, turnaround, and access to the proposed Valve Building and IT/Communications Building. Approximately 160 feet southwest of the newly proposed site entrance gate, a second 30-foot-wide manual swinging wrought iron gate would be located next to the replaced La Coronilla Pump Station and Valve Building, and would limit access to the reservoirs to only City Water Resources Division personnel. From this second gate, a proposed 24-foot-wide paved reservoir access road would provide access to the top of the reservoir site. A smaller, paved area would be provided near the northeastern tank for fire truck access and turn-around. Access roads and turnaround areas would comply with all applicable City of Santa Barbara Fire Department standards.

Approximately halfway up the paved access road, another new paved road would extend to the terraced area. The Project would also construct a new 12-foot-wide site perimeter road, with a finished surface of turf block or similar for the purposes of perimeter site access for landscaping, maintenance, fire and safety personnel, and for driving access for third party utility maintenance (e.g., Southern California Edison).

Construction access is described in *Construction Staging and Traffic*.

Security

The site entrance vehicle gate would be equipped with controlled access for City staff. The two new gates would have manual locks and Knox boxes for fire access, and would be equipped with security cameras. All new structures would have keyed or card reader exterior door access.

The proposed Project would remove all unauthorized pedestrian gates installed by private property owners within the existing perimeter fencing. The Project would replace or maintain existing fencing and install new fencing to enclose the entire perimeter of the site. New fencing visible from the ROW along Dolores Drive would be Shepherd hook configuration of uniform height, and new fencing not visible from the ROW or other public viewing areas would be either Shepherd hook or chain-link.

Re-abandoned Oil Well

The Project would re-abandon to current standards the existing abandoned oil well onsite underneath the north-east corner of the Vic Trace Reservoir. Due to the oil well's location under the existing reservoir, its current top of casing elevation is unknown. The Project would locate the existing oil well, and cut and cap the oil well casing to an elevation lower than the new reservoir concrete floor prior to installation of the new reservoir. The Project would also install a new cement plug from the top of the cut casing to approximately 75 ft deep. Re-abandonment procedures would be in coordination and compliance with the State of California's Department of Conservation, Geologic Energy Management Division (CalGEM).

Replaced Valve Building

The Project would demolish the existing Valve Building near the site entrance driveway. A new 1,000-square foot concrete Valve Building with a metal deck roof would be constructed. The new Valve Building would house the control valves, booster pumps ("La Coronilla Pump Station"), hypochlorite disinfection system, electrical and remote monitoring equipment, and a restroom. Space adjacent to the Valve Building would be allocated for a hydropneumatic tank and standby generator.

The standby generator would consist of a diesel engine-driven generator rated 480V, 3-phase, 60-hertz (Hz), 0.8 power factor, 150 kilowatt (kW). The generator would be installed in a sound-attenuating weatherproof enclosure adjacent to the proposed Valve Building. An aboveground fuel tank would be provided on the same pad as the generator set. The fuel tank would have a double wall and a leak detection device.

All metal vessels used as hydropneumatic tanks must be constructed to American Society of Mechanical Engineers (ASME) standards, including maximum operating pressure and minimum wall thickness.

Renewable Energy

The Project may involve construction of renewable energy generation and storage equipment to sustainably power the replaced valve building and pumps. If installed, a photovoltaic (PV) solar energy generation system would be 60 kilowatts (kW) and would power the onsite electrical facilities at a minimum. A 60 kW system equates to approximately 4,500 square feet of solar panels that would either be installed on top of the reservoir area and/or on south-west facing hillslopes to maximize solar generation. The solar system would consist of solar panels, wiring and conduits, an inverter, electrical meter and possible battery storage.

Relocated Communications/IT Building and Antennas

The existing Communications/IT Building would be demolished. A new 400-square foot concrete or concrete masonry IT building with a metal deck roof would be constructed near the site entrance, on the east side of the new Valve Building or would remain near the IT Building's existing location east of the existing reservoir. The majority of the existing antenna towers would be demolished and some antenna towers and pedestals would be rebuilt, relocated, or modified on-site. The total number of antenna towers would not increase as compared to existing conditions. Tower heights may increase as compared to existing conditions but would not exceed 65 feet, the Santa Barbara Municipal Code (SBMC) height limit for antennas serving emergency communications located in residential areas (SBMC Section 30.185.410.C.1a). The IT building would be equipped with a 50 kW diesel generator, which are designed to store approximately 50 gallons of diesel fuel.

Terraced Area

Portions of the Vic Trace Reservoir parcel to the northwest and southwest sides of the new reservoirs would be graded to create approximately 7,000 square feet of terraced areas for storage and laydown of materials, staging for repairs and replacement, and ongoing operations and maintenance needs, necessitating the export of approximately 83,000 cubic yards of soil. The terraced area would be covered with pervious materials and an asphalt impervious access road for fire personnel access.

Landscaping

Figure 5 shows the proposed landscape plan. Existing plants and trees within the development footprint would be removed prior to grading and excavation. Vegetation removal would include up to approximately

55 trees, including approximately seven coast live oaks. All removed trees would be replaced on the Vic Trace parcel.

Following the completion of construction, new drought-tolerant and fire-resistant landscaping would be installed. The proposed plant palette would consist of a mix of California native shrubs, trees, and ornamentals, and would require no irrigation once plants are established, as well as minimal maintenance activities. All proposed plant species would comply with the City of Santa Barbara's Fire Department Fuel Modification requirements (SBMC Section 8.04), as well as the State of California's Model Water Efficient Landscape Ordinance. Landscaping would comply with Santa Barbara's Water Efficient Landscape Standards (SBMC Section 14.23.005).

Stormwater

The Project would install stormwater best management practices (BMPs) on the Vic Trace Reservoir parcel. Much of the parcel would remain pervious, and stormwater flows are expected to infiltrate or match existing surface flow patterns. Grading and drainage would be configured to encourage slowing and infiltrating stormwater on-site. Storm drain piping would be installed on-site to convey water to stormwater BMPs and storage areas.

The site perimeter road would be sloped back into the hillside, directing water to a vegetated swale. On the southern portion of the parcel, stormwater flows would be directed to a stormwater storage area situated on the western portion of the parcel. Excess flows would enter the storm drain system offsite. The Project would comply with the City's Storm Water BMP Technical Guidance Manual adopted in 2020 and would comply with Tier 4 requirements.

Lighting

Lighting on the Vic Trace Reservoir site would be similar to existing conditions. Lighting would be located at the new buildings and would comply with the City's Outdoor Lighting Ordinance ([SBMC] Chapter 22.75) and Outdoor Lighting Design Guidelines. Consistent with existing conditions, lighting would only be turned on for safety during occasional nighttime maintenance and repair work.

La Coronilla Park

The only improvements proposed at La Coronilla Park are minor upgrades to the existing reservoir pipeline infrastructure. All improvements would be underground, and disturbed areas would be restored to pre-Project conditions following construction. Temporary construction access (e.g., an eight-foot-wide graded temporary road) may be provided through the park. Upon completion of construction activities at La Coronilla Park, disturbed areas would be restored to pre-Project conditions. It is anticipated public access to a section of La Coronilla Park would be unavailable for approximately six months during Project construction.

Offsite Improvements

Relocated La Coronilla Transmission Main

The proposed Project would abandon in-place a portion of the existing 24-inch water transmission main that conveys finished drinking water from the City's Cater Water Treatment Plant to the Vic Trace Reservoir, located within a City utility easement in the backyards of single-family residences that front La Coronilla Drive. Minor aboveground appurtenances (e.g., valve cans) would remain in place. The existing pipeline would be cut and capped in place from the public ROW. No ground disturbing activities would occur associated with the abandonment, and no work would be required outside of the public ROW.

The Project would also install a new, relocated 24-inch water transmission main within La Coronilla Drive ROW, between Meigs Road and the proposed Valve Building at the Vic Trace Reservoir site, likely within the same trench as a previously abandoned 8-inch distribution main. The Project would remove the previously abandoned water main during construction. Unless provided a waiver is provided from the California Division of Drinking Water, separation requirements between water and sewer mains, approximately 150 linear feet of the 24-inch water transmission main along La Coronilla Drive would be installed under existing concrete driveways and sidewalks within the public ROW to meet water and sewer pipeline separation requirements. Portions of existing concrete sidewalks and driveways aprons within the right of way disturbed by the Project would be replaced to match existing grades as required by the new alignment.

Replaced Vic Trace Outlet Main

The Project would install a new reservoir outlet main, consisting of a 12- or 16-inch pipeline that would exit the Vic Trace Reservoir towards the parcel's entrance on La Coronilla Drive, head north along La Coronilla Drive and then turn south along Dolores Drive to the new PRV station located at the intersection of Meigs Road and Dolores Drive. At the PRV, the pipeline would turn south along Meigs Road and reconnect to an existing water main at the intersection of Meigs Road and Red Rose Way. The new reservoir outlet main would convey water from the Vic Trace Reservoir to the new PRV station, where water pressure would be reduced. Construction activities would occur within the Vic Trace Reservoir parcel, Dolores Drive, and Meigs Road and La Coronilla Drive ROWs.

Replaced Dolores Drive Main

The Project would abandon in place or remove the existing, aging, cast iron 8-inch water main within Dolores Drive and replace it with a new water main of the same size and capacity. Replacement of the water main would minimize future possible service disruptions and emergency shutdowns from water infrastructure failure. Construction would include the reconnection of existing service lines from the existing main to the new main, and all construction activities would occur within the Dolores Drive ROW.

New Ricardo Avenue Main

The Project would also install a new water main along Ricardo Avenue. It would connect to the proposed discharge main at the intersection of Ricardo Avenue and Dolores Drive and traverse along Ricardo Avenue to La Vista Del Oceano Drive. Construction activities would occur within the Ricardo Avenue ROW.

Entry/Exit Pits for La Vista Del Oceano Pipeline Lining

An existing underground Vic Trace Reservoir Outlet Main runs south from the Vic Trace Reservoir site to the existing PRV on La Vista Del Oceano Drive. The northern portion of the pipeline, running from the Vic Trace Reservoir site to Ricardo Avenue, would be abandoned in place. No ground disturbance would be required. The southern portion of the pipeline, which extends from Ricardo Avenue to the existing PRV on La Vista Del Oceano Drive, would be rehabilitated through trenchless relining. Two lining pits would be temporarily excavated within the public ROWs on Ricardo Avenue and La Vista Del Oceano Drive. No ground disturbance is proposed outside the public ROWs. Relining construction activities are detailed in *Pipeline Abandonment, Rehabilitation, and Construction*.

Existing PRV (to be abandoned)

PRV stations convey and regulate water between zones of different water pressure across the City. The existing La Vista Del Oceano PRV station provides a critical flow path between pressure zones. The existing PRV station does not meet current OSHA personnel safety standards. The proposed Project would abandon the existing La Vista Del Oceano PRV station located within the paved ROW north of Cliff Drive at La Vista Del Oceano.

Proposed PRV Station (to be constructed)

The Project would construct a new PRV underground within the Dolores Drive ROW, on the southern sidewalk approximately 80 feet east of the intersection of Meigs Road and Dolores Drive, east of an existing stormwater drop inlet facility. The approximate dimensions of the PRV station would be 16 feet by 8 feet with an approximate ground disturbance area of 18 feet by 10 feet. This PRV would replace the existing La Vista Del Oceano PRV to be abandoned and described above. A temporary construction easement may be required to construct the PRV, as equipment may require adjacent staging space on private property to the south (APN 035-142-011).

Project Construction

Construction Schedule

Construction activities would generally occur from 7:00 A.M. to 5:00 P.M., Monday through Friday. While the majority of construction would occur during daytime hours and weekdays, occasional nighttime or weekend activities may be required to minimize water outages.

Construction of the proposed Project is expected to occur over approximately three years, anticipated to begin in July 2028 and end in August 2031. Table 2 provides the estimated construction durations. Project activities may occur concurrently.

Table 2 Project Construction Schedule

Activity	Approximate Duration
Vic Trace Reservoir Shutdown, Drainage, and Demolition	4 months
Oil Well Re-abandonment	6 months
New Reservoir Construction	16.5 months
Vic Trace Reservoir Site Improvements	19.5 months
On and offsite Pipeline Construction	24 months
PRV Station Relocation	6 months

Vic Trace Reservoir Parcel Construction Activities

The Project would shut down, drain, and demolish the existing Vic Trace Reservoir. Project demolition would include the entire existing Vic Trace Reservoir, appurtenant piping, pavement, and reservoir fencing; the existing Valve Building, IT/Communications Building, hydro-pneumatic tank, disinfection facilities, generator, and aboveground fuel tank; asphalt pavement and curb and gutter along La Coronilla Drive at the site entrance; the existing entrance access road from the Valve Building to the reservoir pad; all existing on-site utilities; and most existing on-site vegetation.

Table 3 identifies anticipated Project demolition debris quantities associated with demolition of the existing Vic Trace Reservoir. Haul routes and disposal are discussed in *Construction Staging and Traffic*.

Table 3 Anticipated Project Demolition Debris Quantities

Material	Volume (cubic yards)	Weight (tons)
Concrete	2,010	4,223
Steel	29	194

Project construction activities would include grading the site, re-abandoning the oil well, constructing two 5 MG reservoirs, constructing retaining walls to create terraced areas, and constructing the Valve and Communications/IT Buildings. The terraced areas would be used for staging and laydown during construction, and for other water operations and maintenance uses during the reservoir's ongoing operation. Approximately 13,840 cubic yards of concrete would be required for the retaining walls.

The major elements of construction for prestressed concrete reservoir tanks include the tank floor, footings and columns, wall sections, and the roof. Approximately 6,450 cubic yards of concrete would be required for reservoir construction.

Temporary Water Storage

Temporary water storage at the Vic Trace Reservoir during construction activities would likely not be required, as the City will have sufficient offsite storage elsewhere in the water system by the start of the Project to accommodate the construction duration. This was preliminarily confirmed by hydraulic analysis performed for the City's Water Distribution Infrastructure Plan in 2019 and will continued to be studied.

Pipeline Abandonment, Rehabilitation, and Construction

La Coronilla Transmission Main Abandonment

The existing La Coronilla Transmission Main to be abandoned would be cut and capped with a welded on blind flange or plate. No ground disturbing activities would be required for the abandonment. Minor aboveground appurtenances (e.g., valve cans) would remain in place.

Existing Vic Trace Outlet Main Abandonment and Rehabilitation

The existing Vic Trace Outlet Main would be partially abandoned and partially rehabilitated as part of the La Vista Del Oceano Pipeline Lining portion of the Project. The following sections outline the abandonment and rehabilitation activities:

- **Northern Segment Abandonment (Existing Vic Trace Outlet Main):** The northern segment would be abandoned in place. No ground disturbance would be required for this portion, and the pipeline would be cut and capped at its terminus near Ricardo Avenue.
- **Southern Section Rehabilitation (La Vista Del Oceano Pipeline Lining – Entry and Exit Pits):** The southern segment would be rehabilitated using trenchless relining methods. Construction would begin with the excavation of an approximately 6-foot by 10-foot by 6-foot-deep entry pit within the Ricardo Avenue ROW to expose the existing pipeline. A corresponding exit pit, approximately 6 feet by 10 feet by 8 feet deep, would be excavated near 1532 La Vista Del Oceano on the western side of the roadway, either within the ROW or an existing utility easement. From the entry pit, a liner would be installed heading south through the existing pipeline alignment towards the exit pit. Upon completion of the relining process, custom fittings would be installed within the trench, followed by backfilling and repaving of the disturbed roadway surface. Final restoration would include installation of fittings, backfilling, repaving, and/or replanting, as appropriate.

New, Replaced, and Relocated Pipelines

The Relocated La Coronilla Transmission Main, New Vic Trace Outlet Main, Replaced Dolores Drive Main, and New Ricardo Avenue Main would be constructed using open-cut trench methods. Open-cut trench pipeline installation typically consists of trench excavation (including saw cutting of pavement where applicable), removal of pipeline, pipe bedding stabilization, pipe installation, and backfill. The construction crew would typically operate a backhoe and/or excavator, compaction equipment (attachment on an excavator and hand-operated equipment), dump trucks for stockpiling of soils and delivery of backfill material, utility trucks (with truck-mounted or towed generator and hand tools), and water trucks/water buffalos.

Pipeline construction would progress in a linear manner along each alignment, with an estimated average installation rate of approximately 75 feet per day. Generally, trench spoils would be temporarily stockpiled within the working area adjacent to the pipeline trench or on the Vic Trace Reservoir parcel.

PRV Station Abandonment and Construction

PRV station abandonment activities would be limited to valve replacement within the existing PRV; no excavation would be required, as the valve can be replaced using existing manhole entrances and mechanical tools.

Construction of the new, relocated PRV station at Dolores Drive and Meigs Road would involve excavation, installation of the vault and equipment, and backfilling. First, a hole would be excavated (18 feet long by 10 feet wide by 8 feet deep) to accommodate the new vault (16 feet by 8 feet) with the top of the vault and hatches at grade. Some of the excavated area may be on private property (approximately 2 feet by 18 feet). The utility vault would either be cast in place or pre-cast. If pre-cast, the vault would be installed with a small crane. The vault would contain water appurtenances such as pipelines, valves, a sump pump, and remote water monitoring equipment, and would be connected to electrical power.

Aboveground features at the new PRV station are expected to include a programmable logic controller (PLC) panel, a separate Southern California Edison (SCE) electrical service enclosure, and a low-profile antenna for Supervisory Control and Data Acquisition (SCADA) communications. These components would be installed adjacent to the underground vault, with all electrical connections routed underground to a nearby overhead power pole at the intersection of Dolores Drive and Meigs Road. Additional visible elements may include at-grade access hatches and small vent pipes, consistent with other PRV installations throughout the City. Additional underground pipelines would be constructed to connect the PRV station to existing pipelines within the ROW.

Construction Staging and Traffic

Staging and Laydown

Construction staging and laydown would occur on the Vic Trace Reservoir parcel. Equipment and office trailers may be staged near the existing Valve Building. Some construction staging and laydown may occur within the public right-of-way along La Coronilla Drive, Dolores Drive, Ricardo Avenue, and La Vista Del Oceano.

Construction Traffic

Consistent with City Transportation Division requirements, construction-related truck trips would be scheduled during working hours (7:00 a.m. to 5:00 p.m.). While the majority of construction would occur during daytime hours and weekdays, occasional nighttime or weekend construction traffic may be

required to minimize water outages or for construction activities that necessitate continuous work (e.g., concrete pouring).

Across the anticipated five-week demolition phase, approximately 224 two-way truck trips are estimated for removal of concrete and steel, or approximately eight to 10 per day.

Across the anticipated four-month excavation and site grading phase, approximately 9,230 two-way truck trips are estimated for removal of soil, or approximately 100 to 110 per day.

Across the Project construction period, approximately 1,440 two-way truck trips are estimated for delivery of concrete. Assuming this is spread over 100 working days, this yields approximately 14 per day.

At least 11,700 worker trips are anticipated throughout the entire construction period (approximately three years). Assuming at least 780 working days in total, this yields approximately 15 worker trips per day.

Demolition and other debris that cannot be recycled through other means would likely be hauled to the South Coast Recycling & Transfer Station (4430 Calle Real, Goleta), which would direct trash to the Tajiguas Landfill (14470 Calle Real, Goleta). The haul route would likely proceed northwest from the Project site along La Coronilla Drive, with a right turn on West Carrillo Street and northeast towards US-101 North.

Construction traffic, including haul trucks and construction worker vehicles, would access the Project site via two potential routes: La Coronilla Drive, via West Carrillo Street/Meigs Road to United States Highway 101; or Dolores Drive, via Meigs Road and Cliff Drive to United States Highway 101.

All staging and personnel parking would occur on-site at the Vic Trace Reservoir parcel.

Traffic Controls

Signage and flagger controls would be implemented within various roadways across the Project site. Traffic control at the intersection of Meigs Road and Cliff Drive would include signs advising drivers of trucks entering and exiting Dolores Drive.

The City would engage in community outreach to notify the neighborhood of anticipated road closures and construction activities. Notifications may include, but are not limited to, social media posts, mailers, and/or emails to interested parties and neighbors. The City would also coordinate directly with adjacent property owners to notify them of daily roadway access and parking restrictions.

Operation and Maintenance

Upon completion of construction activities, regular operation, maintenance, and IT activities at the Vic Trace Reservoir parcel would resume and would be similar to existing conditions. Compared to existing conditions, electricity consumption would increase by approximately 70,000 kWh per year to power the replaced La Coronilla Pump Station and new security systems not currently in place.

In the event any Project component is compromised during operation, the City would conduct emergency repairs as soon as possible; emergency response and repairs are part of the City's normal operations to maintain system integrity and reliability and are not a new or increased activity associated with the Project.

Summary of Potentially Required Approvals

Table 4 lists the anticipated permits and discretionary approvals that may be required for Project-related activities. One of the purposes of the Initial Study is to provide these agencies with information to support the agency permitting process. Table 4 also lists the types of activities that would be subject to these requirements.

Table 4 Summary of Potentially Required Permits/Approvals

Regulating Entity	Potential Permit/Approval	Reason for Permit/Approval
Central Coast Regional Water Quality Control Board	National Pollutant Discharge Elimination System (NPDES) Stormwater Construction General Permit	Construction activities resulting in ground disturbance exceeding one acre
City of Santa Barbara	Encroachment Permit	Pipeline construction within City rights-of-way
	Tree Removal Permit	Removal of trees
	Conditional Use Approval	City project requiring discretionary review
	Building Permit	Compliance with building and safety codes
	Grading Permit	Site grading
	Design Review	Review design for compatibility
	Discharge Permit	Possible construction dewatering
Santa Barbara County Air Pollution Control District	Authority to Construct (ATC)/Permit to Operate (PTO)	Generator installation
Santa Barbara County Public Health Department, Environmental Health Services Division	Soil Management Plan approval	Possible excavation of oil contaminated soils from existing abandoned oil well
	Aboveground Fuel Storage approval	Construction of aboveground fuel tanks.
Division of Drinking Water Santa Barbara District	Water Supply Permit amendment	Changes to a water supply source, storage, treatment, or for the operation of new water system components
California Department of Conservation, Geologic Energy Management Division	Oil Well Re-abandonment Permit	Construction activities resulting in the re-abandonment of existing abandoned oil well
Southern California Edison	Project Permit Temporary Power Service	Consolidation, modification, and relocation of electrical services, temporary service during construction
Frontier Communications	Project Permit	Modification and relocation of cable communication service

PROPERTY CHARACTERISTICS

Site Information

Assessor's Parcel Number:	035-033-031	*Lot Area:*	Approximately 15 acres
General Plan Designation:	Institutional; Parks & Open Space	*Zoning:*	RS-15; PR
Existing Use:	Water infrastructure & Neighborhood Park	*Slope:*	The Vic Trace parcel contains a sloped hillside. The hillside slopes range from approximately 15 percent to 40 percent. The slope face around the reservoir flattens out briefly for a narrow dirt/grass site perimeter road. Slope faces between the site perimeter road and the reservoir perimeter road are 150 to 300 feet wide and have an elevation difference of 50 to 60 feet. There are no visible terraces or benches on the slopes. The slopes on top of the hill around the reservoir, antennae, and structures range between 1 percent and 5 percent.

Surrounding Land Uses & Zoning

	Existing Uses	*Zoning*
North:	Residential	RS-15
South:	Residential; Commercial	RS-15; C-R
East:	Residential	RS-15
West:	Residential	RS-15; R-2

ENVIRONMENTAL SETTING

Existing Site Land Uses and Characteristics

Vic Trace Reservoir Parcel

The Vic Trace Reservoir parcel (site) covers approximately 15 acres and contains Lavigia Hill. The peak of Lavigia Hill sits approximately 460 feet above sea level, 50 feet higher than the site entrance at La Coronilla Drive.

The parcel hosts existing City-owned infrastructure facilities, including:

- **Vic Trace Reservoir:** Vic Trace Reservoir is a partially buried drinking water storage reservoir with a storage capacity of 10 (MG). Located in the center of the parcel at the top of Lavigia Hill, the reservoir was constructed in 1956 of rectangular concrete and measures 248 feet in width, 380 feet in length, and with a side water depth of 20 feet. The concrete-lined reservoir sits primarily below ground, surrounded by a raised concrete foundation. Above ground, the reservoir is covered by a low-pitched side gabled roof sheathed in corrugated metal siding on a low concrete wall. The existing reservoir extends approximately 4 feet above ground level and is not visible from adjacent public roads.
- **Valve Building:** The Valve Building is located at the northern entrance to the Vic Trace Reservoir parcel, adjacent to the driveway/easement from La Coronilla Drive. The structure was built in 1956 and is 25 feet long, 20 feet wide, and 14 feet tall. It is constructed of poured concrete and capped by a flat roof. The Valve Building contains control valves for the reservoir, the La Coronilla Pump Station, post-water disinfection (chlorine) storage and feed equipment, and an adjacent metering vault and hydropneumatic tank.
- **Telecommunications Facilities**: City radio equipment and a communication facility are situated on the parcel, which is also leased by AT&T and Santa Barbara Wireless Foundation (previously known as the Santa Barbara Amateur Radio Club) , both vacating the site by 2026. A City-owned Information Technology (IT) Building 30 feet long by 27 feet wide houses a generator, with a connected 250-gallon diesel fuel tank outside of the building. A second mobile structure is owned by the Santa Barbara Wireless Foundation and will be removed prior to the Project.
- **Abandoned Oil Well:** An existing, previously abandoned oil well (drilled and abandoned in 1935) is located in the vicinity of the north-east corner of the existing Vic Trace Reservoir. The oil well was drilled to a depth of 1,555 feet. The oil well did not produce any oil and was abandoned per State of California Division of Oil and Gas abandonment procedures in the same year.

One ingress and egress driveway provides site access to the Vic Trace Reservoir parcel. A one-lane, 20-foot wide paved road runs from La Coronilla Drive southward up Lavigia Hill to the existing reservoir and telecommunication facilities. An unpaved approximately 8-foot wide access road continues intermittently around the perimeter of the reservoir. A combination of chain link and shepherds hook fencing (5-8 ft tall) surround the perimeter of the property (with the exception of La Coronilla Park). A second internal chain link fence (7 ft tall) encloses the reservoir roof area. A locked, chain link security gate is located at the property entrance.

The western portion of the Vic Trace Reservoir parcel also contains La Coronilla Park, an undeveloped, vegetated neighborhood park situated between 726 and 812 Dolores Drive.

Other than the developments described above, the remainder of the Vic Trace Reservoir parcel is generally undeveloped with vegetation communities such as grassland, coast live oak woodland,

eucalyptus grove, sagebrush, and ice plant mats. The parcel is regularly mowed and vegetation is maintained for fire suppression. Unauthorized pedestrian gates have been installed by private property owners along the perimeter fencing. Figure 8 shows site photographs of existing conditions at the Vic Trace Reservoir parcel and offsite infrastructure improvement areas.

Offsite Improvements

Offsite of the Vic Trace Reservoir parcel, the existing pipelines and the existing La Vista Del Oceano Pressure Reducing Valve (PRV) station are located underground in paved roadways in the Alta Mesa residential neighborhood surrounding the Vic Trace Reservoir site. PRV stations convey and regulate water between zones of different water pressure across the City. The proposed PRV station relocation site is located on undeveloped land in public right-of-way (ROW), in between a paved curb, sidewalk and a fenced private property.

Figure 8 through Figure 11 show site photographs of existing conditions at the Vic Trace Reservoir parcel and offsite infrastructure improvement areas.

Current Land Use Designation and Zoning

The portion of the Vic Trace Reservoir parcel containing water infrastructure facilities has a General Plan land use designation of Institutional and is zoned as residential single unit with a 15,000 square foot minimum lot size (RS-15). The portion of the Vic Trace Reservoir parcel containing La Coronilla Park has a General Plan land use designation of Parks and Open Space and is zoned as a Park and Recreation (P-R). According to the City of Santa Barbara's General Plan Open Space, Parks and Recreation Element, La Coronilla Park is designated as a "Neighborhood Park."

The Offsite Improvement areas are located within paved roadways and public ROW within the surrounding residential neighborhood generally designated as Low Density Residential, with a zoning designation of RS-15 (Residential Single Unit, 15,000 square foot minimum lot size) and RS-7.5 (Residential Single Unit, 7,500 square foot minimum lot size).

Land uses for the Project site and surrounding area are shown in Figure 12. Zoning is shown in Figure 13. As shown, the Project site is not located in the Coastal Zone.

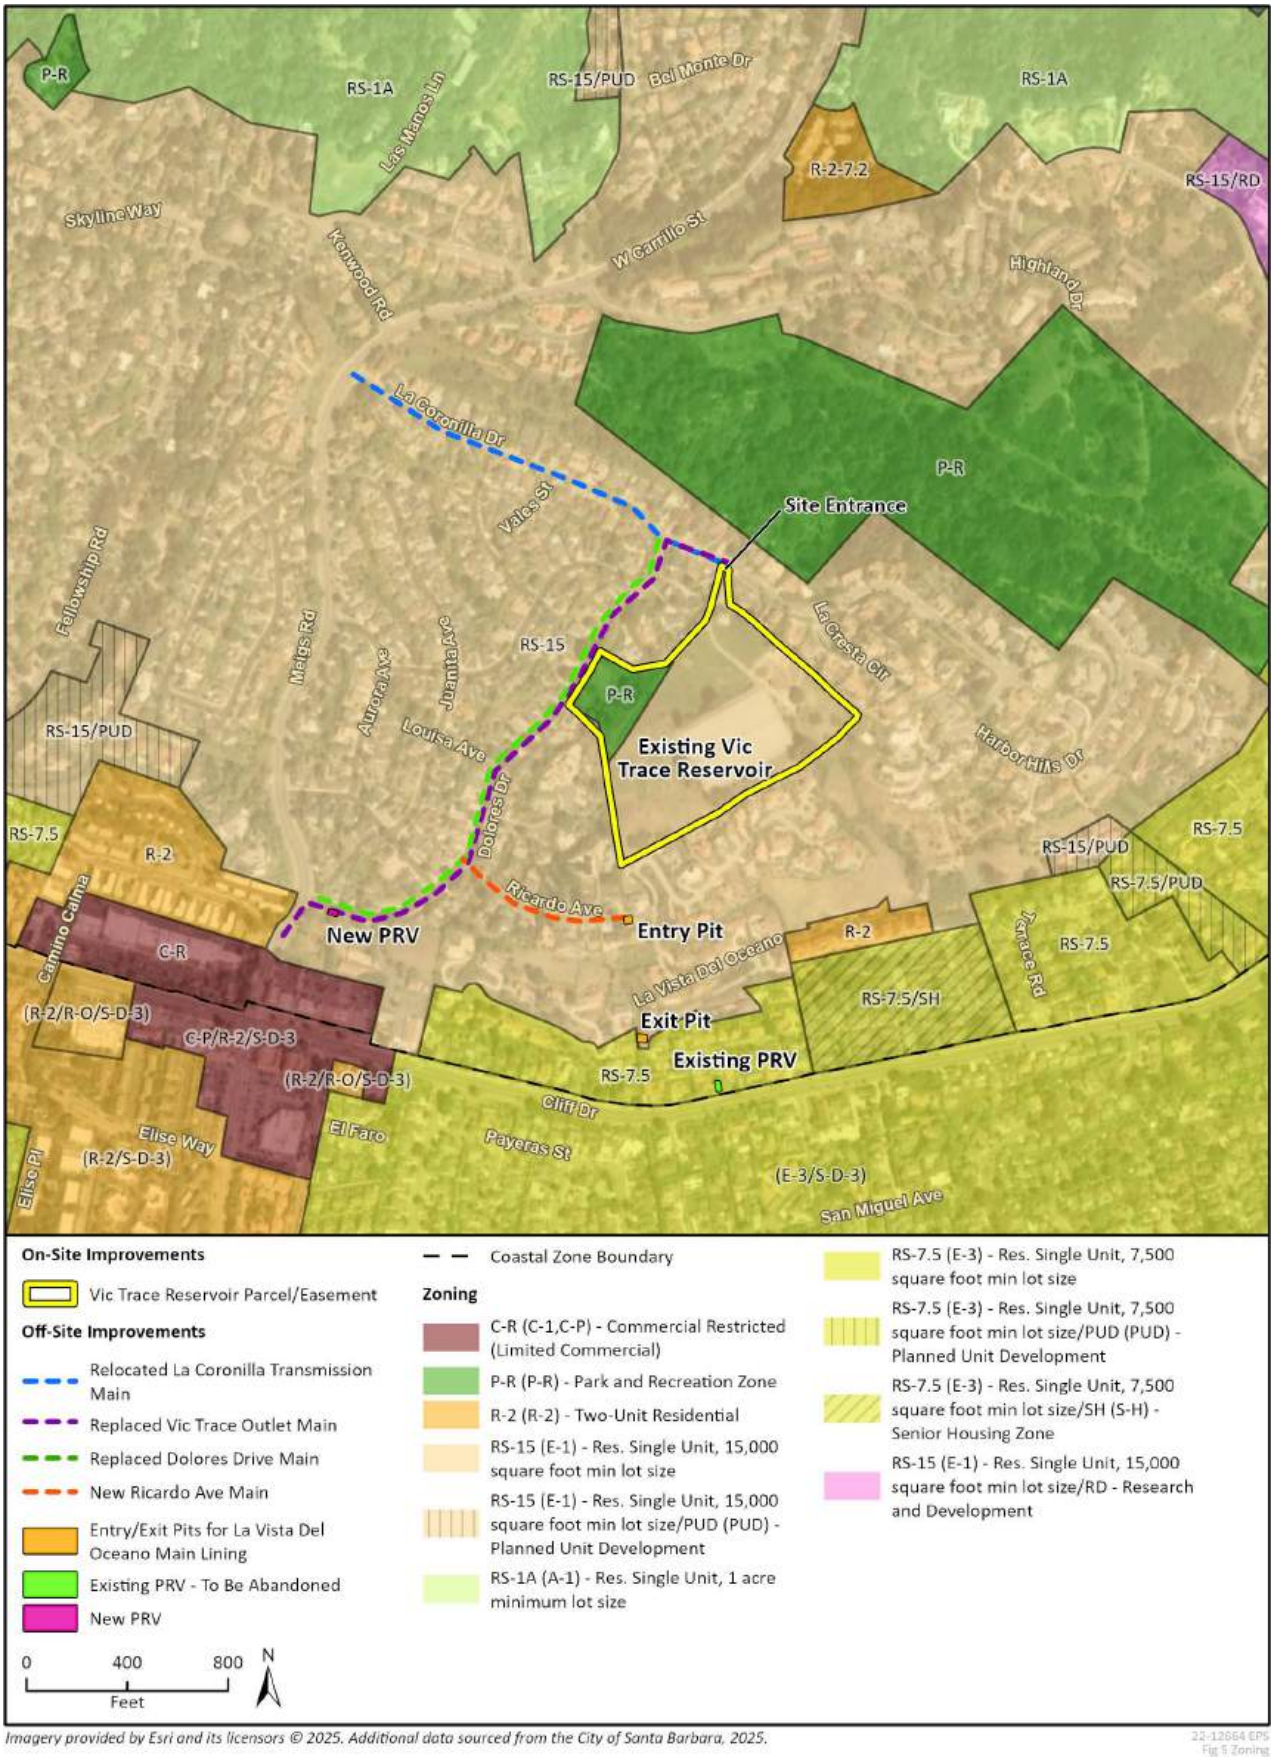
Figure 13 Zoning Map



Neighboring Land Uses and Characteristics

The Project site is situated in the Alta Mesa residential neighborhood, which consists of single-family residences, a church, and streets. Residential land uses surround the Vic Trace Reservoir parcel to the north, south, east, and west. Commercial land uses straddle the portion of pipeline alignment traversing Meigs Road. Surrounding land uses are labeled in Figure 2.

Standard Conditions of Approval

The proposed Project would include the following standard conditions of approval.

Air Quality-Related

AQ-1 **Construction Phase Dust and Diesel Exhaust Control.** The following measures shall be shown on grading and building plans and shall be adhered to throughout grading, hauling, and construction activities:

a. During construction, use water trucks, sprinkler systems, or dust suppressants in all areas of vehicle movement to prevent dust from leaving the site. When using water, this includes wetting down areas as needed but at least once in the late morning and after work is completed for the day. Increased watering frequency should be required whenever the wind speed exceeds 15 mph. Reclaimed water should be used whenever possible. However, reclaimed water should not be used in or around crops for human consumption.

b. On site vehicle speeds shall be no greater than 15 miles per hour when traveling on unpaved surfaces.

c. Install and operate a track-out prevention device where vehicles enter and exit unpaved roads onto paved streets. The track-out prevention device can include any device or combination of devices that are effective at preventing track out of dirt such as gravel pads, pipe-grid track-out control devices, rumble strips, or wheel-washing systems.

d. If importation, exportation and stockpiling of fill material is involved, soil stockpiled for more than one day shall be covered, kept moist, or treated with soil binders to prevent dust generation. Trucks transporting fill material to and from the site shall be tarped from the point of origin. The amount of excavated material or waste materials stored at the site should be minimized.

e. Minimize amount of disturbed area. After clearing, grading, earthmoving, or excavation is completed, or if previously graded areas remain inactive for more than 10 calendar days, treat the disturbed area by watering, OR using roll-compaction, OR revegetating or hydroseeding, OR by applying non-toxic soil binders until the area is paved or otherwise developed so that dust generation will not occur. All roadways, driveways, sidewalks etc. proposed to be paved should be completed as soon as possible.

f. Schedule clearing, grading, earthmoving, and excavation activities during periods of low wind speed to the extent feasible. During periods of high winds (>25 mph) clearing, grading, earthmoving, and excavation operations shall be minimized to prevent fugitive dust created by onsite operations from becoming a nuisance or hazard.

g. The contractor or builder shall designate a person or persons to monitor and document the dust control program requirements to ensure any fugitive dust emissions do not result in a nuisance and to enhance the implementation of the mitigation measures, as necessary, to prevent transport of dust offsite. Their duties shall include holiday and weekend periods when work may not be in progress. The name and telephone number of such persons

shall be provided to the Air Pollution Control District prior to land use clearance for map recordation and land use clearance for finish grading of the structure.

h. All portable diesel-powered construction equipment greater than 50 brake horsepower (bhp) shall be registered with the state's portable equipment registration program (PERP) OR shall obtain a Santa Barbara County Air Pollution Control District (APCD) permit.

i. Fleet owners of diesel-fueled mobile construction equipment greater than 25 bhp are subject to the California Air Resource Board (CARB) In-Use Off-Road Diesel-Fueled Fleets Regulation (https://ww2.arb.ca.gov/our-work/programs/use-road-diesel-fueled-fleets-regulation).

j. Fleet owners of on-road diesel-fueled heavy-duty trucks and buses are subject to CARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation, Periodic Smoke Inspection Program (PSIP), the Statewide Truck and Bus Regulation, and the Advanced Clean Fleets Regulation to reduce emissions from trucks and buses. For more information, see https://ww2.arb.ca.gov/our-work/programs/truckstop-resources/truckstop.

k. Drivers of diesel-fueled commercial motor vehicles are subject to the Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling. Idling restrictions for off-road equipment are set forth in CARB's In-Use Off-road Diesel-Fueled Fleets Regulation. For more information, see https://ww2.arb.ca.gov/our-work/programs/atcm-to-limit-vehicle-idling/about.

l. At a minimum, off-road diesel equipment should be equipped with engines compliant with, or certified to meet or exceed, CARB Tier 4 emission standards. Where available, off-road construction equipment should be zero-emission. Alternative/renewable fuels such as compressed natural gas (CNG), liquefied natural gas (LNG), or propane should be utilized to the maximum extent feasible when zero-emission is not available. Electric auxiliary power units should be used. The Lead Agency should require commitments to Tier 4 and/or zero-emission equipment in applicable bid documents, purchase orders, and contracts; successful contractors should demonstrate the ability to supply the compliant construction equipment for use prior to any ground-disturbing and construction activities.

m. On-road heavy-duty equipment with model year 2014 or newer engines or powered by zero- or near zero-emission technology, should be used whenever feasible.

n. All portable generators should be powered by a source other than diesel or gasoline (i.e., battery, natural gas, propane, etc.).

o. All construction equipment shall be maintained in tune per the manufacturer's specifications.

p. The number of construction equipment operating simultaneously shall be minimized through efficient management practices to ensure that the smallest practical number is operating at any one time. Construction worker trips should be minimized by requiring carpooling and by providing for lunch onsite.

q. Proposed truck routes should minimize impacts to residential communities and sensitive receptors.

r. Construction staging areas should be located away from sensitive receptors such that exhaust and other construction emissions do not enter the fresh air intakes to buildings, air conditioners, and windows. Construction activity schedules and hours should be planned and adjusted as feasible to maximize distance from existing sensitive receptors and minimize exposure to air pollution.

AQ-2 **Asbestos & Lead-Containing Materials.** Pursuant to APCD Rule 1001, the applicant is required to complete and submit an Asbestos Demolition / Renovation Notification form for each regulated structure to be demolished or renovated. The completed notification shall be provided to the Santa Barbara County APCD with a minimum of 10 working days advance notice prior to disturbing asbestos in a renovation or starting work on a demolition. Any abatement or removal of asbestos and lead-containing materials must be performed in accordance with applicable federal, State, and local regulations. Permits shall be obtained from the Air Pollution Control District prior to commencement of demolition of the structures containing asbestos and/or lead. Disposal of material containing asbestos and/or lead shall be in sent to appropriate landfills that are certified to accept this material.

Biological Resource-Related

[Standard Conditions of Approval related to Biological Resources will be addressed in the EIR, where they may be replaced or supplemented with project-specific mitigation measures, as appropriate.]

Cultural Resource-Related

[Standard Conditions of Approval related to Biological Resources will be addressed in the EIR, where they may be replaced or supplemented with project-specific mitigation measures, as appropriate.]

High Fire Hazard Area-Related

HAZ-1. **High Fire Hazard Area Safe Landscaping.** The project landscape plan shall meet the High Fire Hazard Area Defensible Space Requirements outlined in the Community Wildfire Protection Plan (CWPP). All landscape plant species must be fire resistant as described in the CWPP High Fire Hazard Area Landscape Requirements. These plans shall be reviewed and approved by the Fire Department in addition to any required design approvals.

Construction Noise-Related

N-1. Neighborhood Notification Prior to Construction. At least twenty (20) days prior to commencement of construction, the contractor shall provide written notice to all property owners, businesses, and residents within 300 feet of the project area. The notice shall contain a description of the project, the construction schedule, including days and hours of construction, the name and phone number of the (Project Environmental Coordinator and) Contractor(s), site rules and Conditions of Approval pertaining to construction activities, and any additional information that will assist the Building Inspectors, Police Officers and the public in addressing problems that may arise during construction.

N-2. **Construction Hours.** Construction (including preparation for construction work) shall only be permitted Monday through Friday between the hours of 7:00 a.m. and 5:00 p.m., and Saturdays between the hours of 9:00 a.m. and 4:00 p.m., excluding the following holidays: New Year's Day (January 1st); Martin Luther King Jr Day (3rd Monday in January); President's Day (3rd Monday in February); Memorial Day (Last Monday in May); Independence Day (July 4th); Labor Day (1st Monday in September); Thanksgiving Day (4th Thursday in November); Day Following Thanksgiving Day (Friday following Thanksgiving); Christmas Day (December 25th). *When a holiday falls on a Saturday or Sunday, the preceding Friday or following Monday respectively shall be observed as a legal holiday.

When, based on required construction type or other appropriate reasons, it is necessary to do work outside the allowed construction hours, contractor shall contact the City to request a waiver from the above construction hours, using the procedure outlined in ([SBMC] Section 9.16.040) Construction Work at Night. Contractor shall notify all residents within 300 feet of the parcel of intent to carry out said construction a minimum of 48 hours prior to said construction. Said notification shall include what the work includes, the reason for the work, the duration of the proposed work, and a contact number.

N-3. **Construction Equipment Sound Control.** All construction equipment, including trucks, shall be professionally maintained and fitted with standard manufacturers' muffler and silencing devices.

N-4. **Sound Barriers.** The project shall employ sound control devices and techniques such as noise shields and blankets during the construction period to reduce the level of noise to surrounding residents. Proposed measures shall be submitted to the Planning Division for approval and shall result in noise attenuation of 5-10 dBA at the property lines. Noise levels shall be monitored for compliance.

Construction Traffic-Related

TRA-1. **Haul Routes Require Separate Permit.** Apply for a Public Works Permit to establish the haul routes for all construction-related trucks with a gross vehicle weight rating of three tons or more, entering or exiting the site. The Haul Routes shall be approved by the Transportation Engineer.

TRA-2. **Construction Parking.** During construction, free parking spaces for construction workers shall be provided on-site or off-site in a location subject to the approval of the Transportation Engineer.

TRA-3. **Construction Storage/Staging.** Construction vehicle/equipment/materials storage and staging shall be done on-site. No parking or storage shall be permitted within the public right-of-way, unless specifically permitted by the Transportation Engineer with a Public Works permit.

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a “Potentially Significant Impact,” as indicated by the checklist on the following pages.

☒ Aesthetics	☐ Agriculture/Forestry Resources	☒ Air Quality
☒ Biological Resources	☒ Cultural Resources	☐ Energy
☒ Geology/Soils	☒ Greenhouse Gas Emissions	☒ Hazards & Hazardous Materials
☐ Hydrology/Water Quality	☐ Land Use/Planning	☐ Mineral Resources
☒ Noise	☐ Population/Housing	☐ Public Services
☐ Recreation	☒ Transportation	☒ Tribal Cultural Resources
☒ Utilities/Service Systems	☐ Wildfire	☐ Mandatory Findings of Significance

DETERMINATION

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☒ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (1) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (2) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

ENVIRONMENTAL CHECKLIST

The following checklist contains questions concerning potential changes to the environment that may result if this project is implemented. The potential level of significance should be indicated as follows:

Significant: Known substantial environmental impact. Further review is needed to determine whether there are feasible mitigation measures and/or alternatives to reduce the impact.

Potentially Significant: Unknown, potentially significant impact that needs further review to determine significance level and whether any impact identified as potentially significant can be mitigated.

Less than Significant with Mitigation: Potentially significant impact that is avoided or reduced to less than significant level with identified feasible mitigation measures.

Less than Significant: Impact that is not substantial or significant.

Beneficial Impact: Impact would improve environmental conditions.

No Impact: Project would not cause this type of impact.

1. A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
2. All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
3. Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.
4. "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level.
5. Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration pursuant to Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:
    a. Earlier Analyses Used. Identify and state where they are available for review.
    b. Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
    c. Mitigation Measures. For effects that are "Less than Significant with Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

6. Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.
7. Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.
8. This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.
9. The explanation of each issue should identify:
    a. The significance criteria or threshold, if any, used to evaluate each question; and
    b. The mitigation measure identified, if any, to reduce the impact to less than significant.

1. Aesthetics and Visual Resources

1. AESTHETICS AND VISUAL RESOURCES Except as provided in Public Resources Code Section 21099* (CEQA provisions for infill projects within a transit priority area), would the project:	Level of Significance
a) Have a substantial adverse effect on a scenic vista?	Less than Significant
b) Substantially damage scenic resources, including, but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway?	No Impact
c) In nonurbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point.) If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	Less than Significant
d) Create a new source of substantial light or glare which would adversely affect surrounding areas or important public day or nighttime views in the area?	Potentially Significant

** CEQA California A Public Resources Code §21099(d)(1): "Aesthetic and parking impacts of a residential, mixed-use, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment. (2)(A) This subdivision does not affect, change, or modify the authority of a lead agency to consider aesthetic impacts pursuant to local design review ordinances or other discretionary powers provided by other laws or policies. (B) For the purposes of this subdivision, aesthetic impacts do not include impacts on historical or cultural resources." For the purposes of §21099, "transit priority area" means an area within one-half mile of a major transit stop that is existing or planned, if the planned stop is scheduled to be completed within the planning horizon included in the Transportation Improvement Plan or applicable regional transportation plan.*

Discussion

Issues: Issues associated with visual resources and aesthetics include the potential blockage or substantial alteration of important public scenic views, project on-site aesthetic character and compatibility with the surrounding area, substantial changes in exterior lighting and shade/shadow, and introduction of substantial new sources of glare.

Impact Evaluation Guidelines: Aesthetic quality, whether a project is visually pleasing or unpleasing, may be perceived and valued differently from one person to the next, and depends in part on the context of the environment in which a project is proposed. The significance of visual changes is assessed qualitatively based on consideration of the proposed physical change and project design within the context of the surrounding visual setting. First, the existing visual setting is reviewed to determine whether important existing visual resources are involved, based on consideration of whether a view contains one or more important visual resources, has scenic qualities, and is viewed from a heavily used public viewpoint, such as a public gathering area, major public transportation corridor, or area of intensive pedestrian or bicycle use. Under CEQA, the evaluation of a project's potential impacts to scenic views is focused on views from public (as opposed to private) viewpoints and larger community wide views (those things visible to a larger community, as opposed to select individuals). The visual changes associated with the project are then assessed qualitatively to determine whether the project would substantially degrade or obstruct existing important public scenic views or impair the visual context of the Waterfront area or a designated historic resource and whether the visual changes associated would result in

individual or cumulative substantial effects associated with important public scenic views, on-site visual aesthetics, or lighting.

Significant visual resources impacts may potentially result from:

1. Substantial obstruction of important public or communitywide scenic views. Public views may be framed (e.g., view corridor), wide angle, or panoramic. Important scenic views include, but is not limited to the Pacific Ocean, Stearn's Wharf, the Harbor, Douglas Family Preserve, Montecito Country Club, Andree Clark Bird Refuge, Bellosguardo, Santa Barbara Zoo, coastal bluffs and shoreline, creeks, estuaries, lagoons, riparian areas, parks and open space, historic structures, sites, and trees important for their visual quality, Channel Islands, Foothills, Riviera, and Santa Ynez Mountains.
2. Substantial damage to scenic resources within a state scenic highway (Highway 154). Impacts to local scenic roads should also be considered. These include Highway 101; Cabrillo Boulevard between U.S Highway 101 and Castillo Street; Sycamore Canyon Road (144)/Stanwood Drive (Highway 192)/Mission Ridge Road (Highway 192)/Mountain Drive to the Old Mission on Los Olivos Street, or Shoreline Drive from Castillo Street to the end of Shoreline Park.
3. Substantial negative aesthetic effects or incompatibility with surrounding land uses or structures due to project size, massing, scale, density, architecture, signage, or other design features.
4. Substantial degradation of important public or communitywide scenic views or the visual quality of the site through extensive grading and changes in topography, removal of substantial amounts of vegetation and trees visible from public areas without adequate landscaping; or substantial loss of important public open space.
5. Substantial light and/or glare that substantially affects offsite properties and/or sensitive receptors, safe travel, sensitive wildlife, or substantially affects important public views.

Existing Conditions and Project Impacts

1.a) Scenic Views

Less Than Significant Impact. The Project site is located on Lavigia Hill within the Alta Mesa neighborhood of Santa Barbara. Although the Project site is elevated and includes undeveloped areas with some native and non-native vegetation, the Project site is not identified in the City's General Plan as a designated scenic vista (City of Santa Barbara 2011). Public views of the Project site are limited due to the location of public roads elevation being lower than the surrounding residential development, fencing, and elevated topography of the site. Limited portions of the Project site, such as the south-west slope, may be visible from Cliff Drive. La Coronilla Park is visible from Dolores Drive. Scenic resources visible from the vicinity of the Project site include La Coronilla Park, the Pacific Ocean, coastal shoreline, and Santa Ynez Mountains.

Construction activities would involve temporary visual changes to the Project site, including equipment staging, vegetation removal, and grading. These activities would be visible from public roadways such as Dolores Drive and La Coronilla Drive. However, construction activities would not obstruct scenic views of the Pacific Ocean, coastal shoreline, and Santa Ynez Mountains due to intervening development and topography, which restrict current views of these scenic resources. Construction activities would temporarily obstruct views of La Coronilla Park; however, construction would be temporary, and the presence of construction equipment would cease upon completion of construction activities at La Coronilla Park. During operation, the offsite improvements (such as the proposed pipelines and PRV) would be located primarily underground. Minor aboveground appurtenances would be visually consistent with other City water infrastructure.

Figure 6 and Figure 7 in the *Project Description* show visual renderings of the proposed Project elements. As shown in the visual renderings in Figure 7 in the *Project Description*, due to intervening topography, the proposed improvements at the Vic Trace Reservoir parcel would generally not be visible from public vantage points, including La Coronilla Park and adjacent roadways. The visual character of La Coronilla Park would be similar to existing conditions. New structures, including the Valve Building and IT/Communications Building, would be located near the Vic Trace Reservoir parcel entrance and designed to blend with the surrounding environment. Many of the site's existing communication towers would be removed and consolidated into one or two towers not to exceed 65 ft (SBMC Section 30.185.410.C.1a). Aesthetic modifications to new towers may be incorporated (e.g., tree-like concealed tower). Landscaping with drought-tolerant, fire-resistant, and native species would be installed to restore and enhance the visual character of the Vic Trace Reservoir parcel once construction has concluded. Fencing visible from public rights-of-way would be of uniform height and design, and lighting would be limited to safety needs during occasional nighttime maintenance, consistent with the City's Outdoor Lighting Ordinance.

Therefore, construction and operation of the Project would not result in a substantial adverse effect on a scenic vista, and impacts would be ***less than significant***.

1.b) Scenic Highways and Roadways

No Impact. The Project site is not located within the viewshed of a State-designated scenic highway. The nearest State-designated scenic highway is State Route 154, located approximately 3.5 miles to the northwest of the Project site (California Department of Transportation 2018). Additionally, the Project site is not adjacent to or visible from any local scenic roads identified by the City of Santa Barbara. Therefore, the Project would have ***no impact*** on scenic highways and roadways.

1.c) Visual Character and Quality

Less Than Significant Impact. Pursuant to CEQA Guidelines Section 21071, the City of Santa Barbara qualifies as an "urbanized area" even though its individual population is less than 100,000 persons. This is because the combined population of Santa Barbara and the contiguous incorporated City of Goleta meets or exceeds the 100,000-person threshold required under subdivision (a)(2) of Section 21071. This provision allows a city with fewer than 100,000 residents to be considered urbanized if it is adjacent to one or two other incorporated cities and their combined population reaches at least 100,000 persons. Given that the proposed Project would facilitate development in an urbanized area, the impact discussion of visual character and views is focused on consistency with applicable zoning and other regulations governing scenic quality.

The Project site includes two zoning designations: RS-15 (Residential Single Unit, 15,000-square-foot minimum) and P-R (Park and Recreation). The RS-15 zone allows public utility infrastructure as a conditional use, and the P-R zone permits public facilities and infrastructure improvements that support recreational or municipal functions. The proposed Project would be considered an allowable use within both zones and subject to discretionary review and compliance with applicable development standards.

The Project would not conflict with regulations governing scenic quality. As shown in Figure 7, the proposed aboveground structures would have a similar architectural style (e.g. Spanish colonial) as other City facilities and would be consistent in size and scale with existing buildings on-site. The maximum height of the proposed aboveground structures would be 14 feet. The Project would remove approximately 55 trees, including approximately seven coast live oaks, to accommodate grading and construction. In accordance with the City's Tree Preservation Ordinance ([SBMC] Chapter 15.24), all

removed trees would be replaced on-site. The landscape plan includes native, drought-tolerant, and fire-resistant species.

Vegetation removal at the Project site would comply with the Hillside Vegetation Removal Ordinance (SBMC Chapter 22.10), which requires erosion control, slope stabilization, and revegetation. The Project also incorporates stormwater best management practices and slope-sensitive landscaping to maintain hillside integrity. Lighting would be limited to safety needs and designed to minimize glare and spillover, consistent with the City's Outdoor Lighting Ordinance (SBMC Chapter 22.75) and Outdoor Lighting Design Guidelines. Landscaping would comply with the City's Water Efficient Landscape Standards (SBMC Chapter 14.23.005), requiring low-water-use plants and no permanent irrigation.

The Project site is not located within a designated Special Design District, Scenic Overlay Zone, or Coastal Zone View Corridor, and is not visible from any of the City's designated scenic roads. Therefore, the Project would not conflict with applicable zoning or other regulations governing scenic quality, and impacts would be ***less than significant***.

1.d) Lighting and Glare

Potentially Significant Impact. The proposed development of the Project site would result in outdoor lighting similar to existing conditions. Exterior lighting would be located at the Valve Building and IT/Communications Building and subject to compliance with the requirements of the City's Outdoor Lighting Ordinance (SBMC Chapter 22.75) and Outdoor Lighting Design Guidelines. The ordinance provides that exterior lighting be shielded and directed to the ground such that no undue lighting or glare would affect surrounding property occupants or roads. Consistent with existing conditions, lighting would only be turned on for safety during occasional nighttime maintenance and repair work. In addition, proposed building materials do not include materials with the potential for substantial glare.

The Project may include installation of a PV solar energy system either on top of the buried reservoir area or on southwest-facing hillslopes within the Vic Trace Reservoir parcel. These locations are not visible from public scenic viewpoints due to intervening topography and fencing. The solar panels would be constructed with anti-reflective coatings and oriented to maximize solar absorption, minimizing the potential for glare. The system would comply with applicable City ordinances and design guidelines; however, there remains a potential that the solar panels would introduce substantial new sources of glare. As such, Project impacts on lighting and glare would be ***potentially significant*** and will be analyzed in detail in the EIR.

Mitigation Measures

Mitigation may be required and will be discussed in detail in the EIR.

2. Agriculture and Forestry Resources

2. AGRICULTURE AND FORESTRY RESOURCES Would the project:	Level of Significance
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland) as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	No Impact
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	No Impact
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	No Impact
d) Result in the loss of forest land or conversion of forest land to non-forest land?	No Impact
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of farmland to non-agricultural use or conversion of forest land to non-forest land?	No Impact

Discussion

Issues: There are no agricultural designated lands or lands under Williamson Act contracts within the City; however, agricultural lands exist adjacent to the City boundary. Agriculture and forestry resource issues include land use compatibility with nearby agricultural operations and forested lands, and potential indirect impacts that could result in a loss of agriculture and forestry resources (for example, annexation of lands with agricultural resources). Increased density and intensity of land uses have the potential to affect the productivity of nearby agricultural lands.

Impact Evaluation Guidelines: A significant impact could occur from projects that result in the conversion of lands suitable for agriculture to non-agricultural uses or result in a disruption to surrounding agricultural operations.

Existing Conditions and Project Impacts

2.a-e) Agriculture and Forestry Resources

No Impact. The Project site contains no agricultural uses, agricultural zoning, or Williamson Act contracts. The Project site is designated as Urban and Built-up Land by the Department of Conservation Farmland Mapping and Monitoring Program and does not contain Important Farmland (Department of Conservation 2022). The Project site does not include active farmland, forest land, or protected agricultural soils, and the Project would not conflict with zoning for agriculture or forest use or involve other changes in the existing environment which could result in conversion of farmland or forest land to other uses. Therefore, there would be ***no impact*** on agricultural or forestry resources.

Mitigation Measures

No mitigation is required.

3. Air Quality

3. AIR QUALITY Would the project:	Level of Significance
a) Conflict with or obstruct implementation of the applicable air quality plan?	Less than Significant
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is designated in non-attainment under an applicable federal or state ambient air quality standard?	Potentially Significant
c) Expose sensitive receptors to substantial pollutants?	Potentially Significant
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	Less than Significant

Discussion

Issues: Air quality issues involve pollutant emissions from vehicle exhaust, stationary sources (e.g. gas stations, boilers, diesel generators, dry cleaners, oil and gas processing facilities, etc.), and minor stationary sources called “area sources” (e.g. residential heating and cooling, fireplaces, etc.) that contribute to smog, particulates, nuisance dust associated with grading and construction processes, and nuisance odors. Emissions of harmful air pollutants are of particular concern to sensitive receptors. Sensitive receptors are populations who are more susceptible to the effects of air pollution than the population at large and include children, persons over 65 years of age, athletes, and persons with cardiovascular or chronic respiratory diseases. Land uses typically associated with sensitive receptors include residences, schools, parks, playgrounds, recreation facilities, childcare centers, retirement homes, convalescent homes, hospitals, and health care facilities and clinics.

Smog, or ozone, is formed in the atmosphere through a series of photochemical reactions involving interaction of oxides of nitrogen (NO_x) and reactive organic compounds (ROC) (referred to as ozone precursors) with sunlight over a period of several hours. Primary sources of ozone precursors in the South Coast area are vehicle emissions. Sources of particulate matter (PM_{10} and $PM_{2.5}$) include demolition, grading, road dust, agricultural tilling, mineral quarries, and vehicle diesel exhaust.

The City of Santa Barbara is part of the South Central Coast Air Basin. The City is subject to the National Ambient Air Quality Standards (NAAQS) and the California Ambient Air Quality Standards (CAAQS). The CAAQS apply to seven pollutants: photochemical ozone (O_3), carbon monoxide (CO), sulfur dioxide (SO_2), nitrogen dioxide (NO_2), course particulate matter (PM_{10}), fine particulate matter ($PM_{2.5}$), and lead (Pb). There are also established state standards for other criteria pollutants including sulfates, hydrogen sulfide (H_2S), and visibility reducing particulates. The Santa Barbara County Air Pollution Control District (APCD) provides oversight on compliance with air quality standards and preparation of the County Clean Air Plan (2013) and the Ozone Plan (2022).

Santa Barbara County (County) is currently in attainment of most federal and state standards. The County does not presently meet the state PM_{10} standard and is designated nonattainment-transitional for the state ozone standard. See Table 5.

Table 5 County Attainment Status of Federal and State Ambient Air Quality Standards (2025)

Criteria Pollutant	Federal Attainment Status	State Attainment Status
O_3 8-hour	Attainment	**Nonattainment-Transitional**
O_3 1-hour	No standard	Attainment
PM_{10}	Attainment	**Nonattainment**
PM_5	Unclassified	Unclassified
CO	Attainment	Attainment
Pb	Attainment	Attainment
SO_2	Unclassified	Attainment
NO_2	Unclassified	Attainment
S_x	No Standard	Attainment
H_2S	No Standard	Attainment
Vinyl Chloride	No Standard	Unclassified
Visibility Reducing Particulates	No Standard	Attainment

The APCD has analysis and permitting requirements regarding toxic air contaminants (TACs) generated from activities such as gasoline dispensing, dry cleaning, freeways, manufacturing, etc., and may require projects with high TAC emissions to mitigate or redesign features of the project to avoid excessive health risks. The APCD requires submittal of an asbestos notification form for each regulated structure that is proposed to be demolished or renovated. The California Air Resources Control Board (CARB) and APCD also recommend 500-foot buffers between Highway 101 and new residential developments or other sensitive receptors to reduce potential health risks associated with traffic-related air pollutant emissions, particularly diesel particulates. Based on analysis in the certified Final Program EIR for the City of Santa Barbara General Plan Update (2011; herein referred to as the General Plan EIR), the City established an ordinance (SBMC 22.65) that requires design standards for new residential sensitive receptor structures or uses within 250 feet of Highway 101 (excluding minor additions or remodels of existing homes or the construction of one new residential unit on vacant property), that address highway exhaust effects. Certain projects also have the potential to create objectionable odors that could create a substantial nuisance to neighboring residential areas or sensitive receptors and should be evaluated in CEQA documents.

Impact Evaluation Guidelines: A project may create a significant air quality impact associated with criteria air pollutants from the following:

1. Exceeding an APCD pollutant threshold; inconsistency with APCD regulations; or exceeding population forecasts in the adopted County Clean Air Plan (2013) or Ozone Plan (2022).
2. Exposing sensitive receptors, such as children, persons over 65 years of age, or persons with cardiovascular or respiratory conditions, to substantial pollutant concentrations.
3. Placement of sensitive land uses within 250 feet of Highway 101.
4. Substantial unmitigated nuisance dust during earthwork or construction operations.
5. Creation of nuisance odors inconsistent with APCD regulations.

Long-Term (Operational) Air Quality Impact Guidelines: The City of Santa Barbara uses the APCD thresholds of significance for evaluating air quality impacts. In accordance with the APCD Environmental Review Guidelines (2015), the APCD does not consider a proposed project to a significant air quality impact on the environment if operation of the project would:

1. Emit (from all project sources, both stationary and mobile) less than 240 pounds per day for ROC and NO_x, and 80 pounds per day for PM_{10};
2. Emit less than 25 pounds per day of ROC or NO_x from motor vehicle trips only;
3. Not cause or contribute to a violation of any CAAQS or NAAQS (except ozone);
4. Not exceed the APCD health risks public notification thresholds adopted by the APCD Board of 10 excess cancer cases in a million for cancer risk and a Hazard Index of more than one (1.0) for non-cancer risk); and
5. Be consistent with the adopted federal and state air quality plans applicable to the Santa Barbara Air Basin.

Substantial long-term project emissions could potentially stem from stationary sources which may require permits from the APCD and from motor vehicles associated with the project and from other mobile sources. Examples of stationary emission sources that require permits from APCD include gas stations, automobile repair body shops, diesel generators, boilers and large water heaters, dry cleaners, oil and gas production and processing facilities, and wastewater treatment facilities.

Short-Term (Construction) Impacts Guidelines: Projects involving grading, paving, construction, and landscaping activities may cause localized nuisance dust impacts and increased particulate matter (PM_{10}). Dust-related impacts can be mitigated and less than significant with the application of standard dust control mitigation measures pursuant to APCD rules and regulations (e.g., Rule 345, Control of Fugitive Dust from Construction and Demolition Activities) and City ordinance provisions ([SBMC] 22.04.020), such as dampening graded areas and soil stockpiles. Exhaust from construction equipment also contributes to air pollution.

Quantitative thresholds of significance are not currently in place for short-term or construction emissions for non-stationary sources because cumulative basin-wide effects are not identified as significant. However, APCD uses a criterion for stationary sources, which is also considered a guideline for evaluating impacts of construction emissions for non-stationary source projects. The criterion states that a project's emissions from construction equipment shall not exceed 25 tons of any pollutant except CO within a 12-month period. Standard equipment exhaust mitigation measures are recommended by APCD to be applied to projects.

Cumulative Impacts and Consistency with Clean Air Plan (2013) and Ozone Plan (2022): Consistency with the Clean Air Plan and Ozone Plan means that emissions associated with a project are accounted for within each Plan's emissions growth assumptions, land use and population projections, and that a project is consistent with policies adopted within each plan. If the project-specific impact exceeds the ozone precursor significance threshold, it is also considered to have a considerable contribution to cumulative impacts. If a project would exceed the Clean Air Plan growth projections, then the project's impact may also be considered for whether it represents a considerable contribution to cumulative air quality impacts. The Santa Barbara County Association of Governments and CARB on-road emissions forecasts are used as a basis for vehicle emission forecasting. If a project provides for increased population growth beyond that forecasted in the most recently adopted Clean Air Plan and Ozone Plan, or if a project does not incorporate appropriate air quality mitigation and control measures, or is inconsistent with APCD rules and regulations, thena project may be found inconsistent with the Clean Air Plan and may constitute a significant impact on air quality.

Existing Conditions and Project Impacts

3.a) Air Quality Plans

Less Than Significant Impact. Direct and indirect emissions associated with the Project are accounted for in the Clean Air Plan and Ozone Plan emissions growth assumptions for the Air Basin. Appropriate standard conditions related to air quality, including construction dust suppression, would be applied to the Project, consistent with Clean Air Plan, Ozone Plan, APCD rules, and City policies and ordinance provisions, and are identified in the Project Description. The Project is found consistent with the Clean Air Plan and Ozone Plan; therefore, Project impacts would be *less than significant*.

3.b) Cumulative Impacts

Potentially Significant Impact. Construction of the proposed Project could result in emissions of pollutants due to grading, fumes, and vehicle exhaust. Sensitive receptors located nearby could be affected by dust and particulates from grading and exhaust emissions during project construction. Diesel and gasoline powered construction equipment also emit particulate matter and ozone precursors NO_x, and ROC. Project-related emissions have the potential to result in a cumulatively considerable net increase of O_3 and PM_{10}, for which the State is in nonattainment. This impact would be *potentially significant* and will be analyzed in detail in the EIR.

3.c) Sensitive Receptors

Potentially Significant Impact. Sensitive receptors can be found in areas that contain residences, health care facilities, elder-care facilities, rehabilitation centers, schools, daycare centers, and parks. Air emissions, including TACs have adverse implications for public health, particularly for sensitive receptors. Multiple sensitive receptors (single-family residences) are located adjacent to the Project site. Construction of the Project has the potential to expose these sensitive receptors to pollutant concentrations. This impact would be *potentially significant* and will be analyzed in detail in the EIR.

3.d) Odors

Less Than Significant Impact. The Project is limited to potable water infrastructure and would not include land uses involving odors or smoke. The Project would not contain features with the potential to emit substantial odorous emissions, from sources such as commercial cooking equipment, combustion or evaporation of fuels, sewer systems, or solvents and surface coatings. Due to the nature of the proposed land use of the Project, Project impacts related to odors would be *less than significant*.

Mitigation Measures

Mitigation may be required and will be discussed in detail in the EIR.

4. Biological Resources

4. BIOLOGICAL RESOURCES Would the project:	Level of Significance
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S Fish and Wildlife Service?	Potentially Significant
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	Potentially Significant
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	No Impact
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	Less than Significant
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	Potentially Significant
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	No Impact

Discussion

Issues: Biological resources issues involve the potential for a project to substantially affect biologically important natural vegetation and wildlife, particularly species that are protected as rare, threatened, or endangered by federal or state wildlife agencies, and their habitats.

Impact Evaluation Guidelines: Existing native wildlife and vegetation on a project site are assessed to identify whether they constitute important biological resources, based on the types, amounts, and quality of the resources within the context of the larger ecological community. If important or sensitive biological resources exist, project effects on the resources are qualitatively evaluated to determine whether the project would substantially affect these important biological resources. Significant biological resource impacts may potentially result from substantial disturbance to important wildlife and vegetation in the following ways:

1. Elimination, substantial reduction or disruption of important natural vegetative communities, wildlife habitat, migration corridors, or habitats supporting sensitive species such as oak woodland, coastal strand, riparian, and wetlands.
2. Substantial effect on a protected plant or animal species listed or otherwise identified or protected as endangered, threatened or rare.

3. Substantial loss or damage to biologically important native trees, such as oak or sycamore trees

Existing Conditions and Project Impacts

4.a) Candidate, Special Status, or Rare Species

Potentially Significant Impact. No special-status plant species were observed within the Project site during a reconnaissance-level field survey, no threatened or endangered plant species have a potential to occur within the Project site, and no designated critical habitat occurs within or adjacent to the Project site. Due to limited habitat within the Project site and low potential for non-listed special-status plant species to occur, the number of individuals affected by the Project would be low, if any, and would not result in population-level effects on these species.

One fully protected wildlife species, white-tailed kite (*Elanus leucurus*), has a moderate potential to occur within the Project site. This species may utilize suitable nesting and roosting habitat, such as large coast live oak, eucalyptus, and other ornamental trees located within the Project site. Suitable nesting habitat for the species may be impacted by the Project, and potentially significant impacts may result if construction occurs while the species is present within or adjacent to the work areas. Four additional special-status wildlife species, which were not observed or detected during the biological survey, were determined to have potential to occur within the Project site based upon known ranges, habitat preferences for the species, and species occurrence records. Coastal whiptail (Aspi*doscelis tigris stejnegeri*), coast horned lizard (*Phrynosoma blainvillii*), coast patch-nosed snake (*Salvadora hexalepis virgultea*), and western red bat (*Lasiurus frantzii*) have a low potential to occur within the Project area. Marginally suitable habitat for these species (rocky or vegetated drainages with limited or no riparian vegetation) is present adjacent but outside of the Project site. Project impacts to these special-status wildlife species could be *potentially significant* and will be analyzed in detail in the EIR.

4.b) Natural Communities; Riparian Habitats

Potentially Significant Impact. One sensitive natural community occurs within the Project site: lemonade berry scrub (*Rhus integrifolia* shrubland alliance), which is listed on the California Department of Fish and Wildlife's Sensitive Natural Communities List. Direct impacts would occur to lemonade berry scrub due to excavation and grading around the reservoir during construction, which has the potential to remove up to 0.29 acres of lemonade berry scrub. These impacts would be *potentially significant* and will be analyzed in detail in the EIR.

4.c) Wetlands

No Impact. The Project is not located within or adjacent any jurisdictional waters or wetlands (including marshes, vernal pools, etc.). *No impact* on wetlands would occur.

4.d) Wildlife Dispersal and Migration Corridors

Less than Significant Impact. No wildlife movement corridors or wildlife nursery sites are present within the Project site. The site is surrounded by development and does not serve as a connector between larger habitat areas. Additionally, no water sources or features are present besides the reservoir, which is covered and does not allow wildlife access. The site likely supports local wildlife for foraging needs; however, it is expected that construction activities may temporarily affect these species by causing them to avoid the area. Construction would be generally limited to daylight hours; however, some nighttime work may occur on-site and within the adjacent ROW. Construction-related disturbance would be

temporary, and wildlife could resume using the area once Project construction is completed. Impacts would be *less than significant*.

4.e) Local Policies and Ordinances

Potentially Significant Impact. Several coast live oak trees are documented and mapped within the Project site. Several street trees also occur off the paved roadways adjacent to off-site improvements. Proposed vegetation removal includes approximately seven coast live oaks, which are protected by ([SBMC] Section 15.20. Therefore, this impact would be *potentially significant*, and will be analyzed in detail in the EIR.

4.f) Adopted Conservation Plans

No Impact. No Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional or state habitat conservation plan is applicable to the City or the Project site. *No impact* would occur.

Mitigation Measures

Mitigation may be required and will be discussed in detail in the EIR.

5. Cultural Resources

5. CULTURAL RESOURCES Would the project:	Level of Significance
a) Cause a substantial adverse change in the significance of a historical resource pursuant to CEQA §15064.5?	Less than Significant
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA §15064.5?	Potentially Significant
c) Disturb any human remains, including those interred outside of formal cemeteries?	Less than Significant

Discussion

Issues:

Archeological resources are evidence of past cultural occupation, seasonal use, or ephemeral activity reflected in artifacts, food remains, or other evidence that provide insight into past lifestyles and their evolution through time. Prehistoric resources, dating back at least 13,000 years, extend throughout the Santa Barbara Channel, predating European and American colonization. This evidence can be identified on the ground surface and potentially extending several feet below the surface depending upon the nature of cultural deposit, and geomorphological processes including erosion that may bury a location with alluvial sediment.

Historic resources are evidence of the region's cultural shifts from Spanish colonization and Franciscan missions, to subsequent Spanish-Mexican, American settler, and immigrant occupations. The SBMC defines historic resources as structures, sites, cultural landscapes, or features that are designated or eligible for designation as historically significant.

Impact Evaluation Guidelines: Archaeological and historical resource impacts are evaluated based on review of available cultural resource documentation and data gathered from records searches. Existing conditions on a site are assessed to identify whether important or unique resources exist, based on criteria specified in the State CEQA Guidelines §15064.5 and City Master Environmental Assessment Guidelines for Archaeological Resources (April 2025) and Historical Resources (April 2025), summarized as follows:

1. For archaeological resources, there is a high probability the resource:
    a. Contains information needed to answer important scientific research questions and there exists a demonstrable public interest in that information.
    b. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
    c. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

2. For archaeological and historic resources, the resource:
    a. Is designated, or meets criteria for inclusion on a national, state, or local landmark or historic resource register. This includes, but is not limited to, the National Register of Historic Places, National Historic Landmarks, California Register of Historical Resources, California Registered Historical Landmarks, City of Santa Barbara Landmarks, and City of Santa Barbara Structures of Merit.

b. Is determined by the City to be significant, based on substantial evidence.

If important archaeological or historic resources exist on the site, project changes are evaluated to determine whether they would substantially affect these resources. A project could have a significant impact if it may cause a substantial adverse change in the characteristics of a resource that convey its significance or justify its eligibility for inclusion in a national, state, or local register. Impacts may include physically damaging, destroying, relocating, or altering all or part of a resource, altering the characteristics of the surrounding environment that contribute to the resource's significance, neglecting the resource to the extent that it deteriorates or is destroyed, or the incidental discovery of a resource without proper notification and protocols.

Existing Conditions and Project Impacts

5.a) Historical Resources

Less than Significant Impact. The Project site contains one property over 45 years old: the Vic Trace Reservoir and an associated valve structure. Vic Trace Reservoir was recorded and evaluated for listing in the National Register of Historic Places, California Register of Historical Resources, and for local listing as a City of Santa Barbara structure of merit or historic landmark. As a result of the evaluation, Vic Trace Reservoir is recommended ineligible for listing in the National Register of Historic Places, California Register of Historical Resources, and as a local landmark and structure of merit under all applicable criteria. Therefore, Vic Trace Reservoir is not considered: a historic property under Section 106, a historical resource under CEQA (Section 15064.5[a]), or a historic resource under Chapter 2.3 of the City's MEA. Impacts to historical resources would be ***less than significant***.

5.b) Archaeological Resources

Potentially Significant Impact. The Project site has been previously disturbed from the construction and maintenance of Meigs Road, Dolores Drive, La Coronilla Drive, and La Vista Del Oceano; grading and cut and fill activities associated with the construction of the Vic Trace Reservoir and adjacent communications facilities; underground utility installation; and landscaping. Nevertheless, portions of the Project site are considered sensitive for archaeological resources. The City's Archaeological Resources Sensitivity Area Map (City of Santa Barbara 2025) indicates a portion of the proposed Vic Trace Reservoir Outlet Main Replacement alignment and the proposed La Vista Del Oceano PRV Vault area are located within the Prehistoric Resources Period sensitivity area and have an increased sensitivity for archaeological resources. Given the Project site's sensitivity for archaeological resources, impacts to archaeological resources, if encountered during ground-disturbing activities associated with Project construction, would be ***potentially significant***. These impacts will be analyzed in detail in the EIR.

5.c) Human Remains

Less Than Significant Impact. There is no evidence that the Project site contains human remains. Standard conditions of approval for the Project include procedures pursuant to State regulations for the unanticipated discovery of human remains. To minimize or avoid potential impacts, if any human remains are discovered, all construction activities would cease in the immediate area, and the Santa Barbara County Coroner would be contacted in accordance with Title 14 California Code of Regulations (CCR) Section 15064.5(e). If the coroner determines that the human remains are of Native American origin, the Native American Heritage Commission (NAHC) would be notified to determine the Most Likely Descendent (MLD) for the area. The MLD would make recommendations for the arrangements for the

human remains per Public Resources Code (PRC) Section 5097.98. Therefore, impacts on human remains would be *less than significant*.

Mitigation Measures

Mitigation may be required and will be discussed in detail in the EIR.

6. Energy

6. ENERGY Would the project:	Level of Significance
a) Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation?	Less than Significant
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	Less than Significant

Discussion

Issues: Issues include the potential for the project to result in impacts on energy conservation and/or consumption. A project may have the potential to cause such impacts if it would result in the inefficient, wasteful, or unnecessary consumption of energy from sources including construction and operational equipment, electricity, natural gas, and transportation fuel supplies and/or resources. A project may also cause such impacts if it would conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

Impact Evaluation Guidelines: A project has the potential to result in a significant impact if it would:

1. Use large amounts of fuel or energy in an unnecessary, wasteful, or inefficient manner;
2. Constrain local or regional energy supplies, affect peak and base periods of electrical or natural gas demand, require or result in the construction of new electrical generation and/or transmission facilities, or necessitate the expansion of existing facilities, the construction of which could cause significant environmental effects; or
3. Conflict with existing energy standards, including standards for energy conservation, in state or local plans.

Existing Conditions and Project Impacts

6.a-b) Energy Conservation and Consumption

Less than Significant Impact. Project construction would primarily consume fuel to operate heavy equipment, light-duty vehicles, and machinery. Temporary grid power may be used for construction trailers or electric equipment. These energy demands would be short-term and typical for similar projects in the region. Contractors would comply with Title 13, Section 2449 of the California Code of Regulations, which requires fleet owners to retrofit, repower, or replace older diesel engines and follow idling limits and reporting requirements to reduce emissions and fuel use. Contractors would also follow Title 13, Section 2485, which prohibits unnecessary idling of diesel-fueled commercial vehicles. Additionally, heavy-duty equipment must meet United States Environmental Protection Agency Construction Equipment Fuel Efficiency Standards, which promote cleaner technologies and efficient fuel use. These requirements, combined with cost-efficiency considerations, would prevent wasteful or unnecessary fuel consumption.

Once operational, the Project would increase onsite electricity use by approximately 70,000 kWh per year to power the upgraded La Coronilla Pump Station and new security systems. However, water system-wide electricity use will remain the same as the La Coronilla Pump Station will replace an existing nearby

water pump station, which will transition to a backup pump station only with little electrical use. The Project may include a 60-kW PV solar system to offset this demand. The system would consist of solar panels, wiring, conduits, an inverter, electrical meter, and potentially battery storage. Panels would cover about 4,500 square feet, installed either atop the reservoir or on southwest-facing hillslopes to maximize solar exposure.

All new structures, including the Valve Building and IT/Communications Building, would be designed and built to comply with California Title 24 Building Energy Efficiency Standards. These standards, enforced by local agencies, ensure buildings meet energy performance goals and maintain environmental quality. The Project also supports the City's 2024 Climate Action Plan (CAP), *Together to Zero*, which targets carbon neutrality by 2035. The CAP emphasizes reducing emissions from municipal operations, transitioning away from natural gas, and increasing renewable energy generation. By replacing aging infrastructure with energy-efficient equipment, such as booster pumps, disinfection systems, and remote monitoring technologies, the Project would reduce long-term energy consumption and improve operational efficiency. If implemented, the PV system would directly support CAP goals for clean energy and electrification of municipal facilities.

Because the Project is consistent with the General Plan and CAP and would be required to meet Title 24 energy efficiency standards, it would not expend energy in a wasteful, inefficient, or unnecessary manner, nor would it conflict with energy plans or policies. Project impacts would be ***less than significant***.

Mitigation Measures

No mitigation is required.

7. Geology and Soils

7. GEOLOGY AND SOILS Would the project:	Level of Significance
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: i. Rupture of a known earthquake fault as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault? (Refer to Division of Mines and Geology Special Publication 42) ii. Strong seismic ground shaking? iii. Seismic-related ground failure, including liquefaction? iv. Landslides?	Less than Significant
b) Result in substantial soil erosion or the loss of topsoil?	Potentially Significant
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, collapse or sea cliff failure?	Less than Significant
d) Be located on expansive soils, as defined Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risk to life or property?	Less than Significant
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	No Impact
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	Potentially Significant

Discussion

Issues: Geophysical impacts involve geologic and soil conditions, and their potential to create physical hazards affecting persons or property; or substantial changes to the physical condition of the site. Included are earthquake-related conditions such as fault rupture, ground shaking, liquefaction (a condition in which saturated soil loses shear strength during earthquake shaking), or seismic waves; or unstable soil or slope conditions, such as landslides, sea cliff retreat, subsidence (the downward shifting of the Earth's surface; can result in sinkholes); and extensive grading or topographic changes.

Erosion is the movement of rocks and soil from the Earth's surface by wind, rain, or running water. Several factors influence erosion, such as topography, the size of soil particles (larger particles are more prone to erosion), and vegetation cover, which prevents erosion. Projects in areas with high erosion potential could reduce natural ground cover, create exposed cut or fill slopes and increase loss of surface soils and downstream sedimentation. Removal of vegetation and increased earthwork would potentially expose soils to erosion.

Expansive soils are typically composed of clays and are characterized by the ability to undergo significant volume change (shrink and swell) because of variation in soil moisture content. Soil moisture content can

change due to many factors, including perched groundwater, landscape irrigation, rainfall, and utility leakage.

Soil permeability determines the degree to which soil can accept sewage discharge over a period of time. Permeability is measured by percolation rate. In locations where soil does not have percolation rates adequate to manage the peak daily flow from sewage disposal systems, soil and groundwater contamination could occur.

Unique geologic features are features that are unique to the field of geology and typically embody distinct characteristics of a geological principle, provide important information to the field of geology, and/or are the best example of its kind locally or regionally. Paleontological resources include fossils, which are the preserved remains or traces of animals, plants, and other organisms from prehistoric time (i.e., the period before written records). Fossils and traces of fossils are preserved in sedimentary rock units (formed by the deposition of material at the Earth's surface) and are more likely to be preserved subsurface, where they have not been damaged or destroyed by previous ground disturbance or natural causes, such as erosion by wind or water.

Impact Evaluation Guidelines: Potentially significant geophysical impacts may result from:

1. Exposure of people or structures to risk of loss, injury, or death involving unstable earth conditions due to seismic conditions (such as earthquake faulting, ground shaking, liquefaction, or seismic waves), landslides, or sea cliff retreat.
2. Exposure to or creation of unstable earth conditions due to geologic or soil conditions, such as landslides, settlement, or expansive or collapsible/compressible soils.
3. Substantial erosion of soils.
4. Placement of a septic system in an area with soils not capable of adequately supporting disposal of wastewater or where wastewater could potentially cause unstable conditions or water quality problems.
5. Loss or damage to a unique geological feature or paleontological resource.

Existing Conditions and Project Impacts

7.a) Seismic Hazards

Fault Rupture and Ground Shaking

Less than Significant Impact. As with most of Southern California, the Project site is within a seismically active area where active faults could produce ground substantial shaking. The nearest fault is the Lavigia fault, also known as the North Channel Slope fault, located approximately 1,000 feet south of the Project site (Appendix A). No mapped fault traces cross the Project site, and no structural development is proposed within a designated Alquist-Priolo Earthquake Fault Zone. Therefore, the potential for fault rupture at the Project site is considered low, and no fault setback requirements apply.

While the Project may be subject to strong ground shaking in the event of an earthquake, it would not be subject to unusual levels of ground shaking as compared to the rest of the region. All new structures would be designed and constructed in accordance with applicable seismic design standards, such as those identified by the California Building Code (CBC) and American Water Works Association (AWWA). The Project would also upgrade and install new reservoir facilities, including structural improvements specifically intended to reduce the risk of future failures, such as those caused by seismic events. These upgrades would enhance the resilience of critical infrastructure and minimize vulnerability. In the event

an earthquake compromised any Project component during operation, the City would conduct emergency repairs as soon as possible.

Therefore, while the Project site is located within a seismically active area, the Project would not directly or indirectly cause potential substantial adverse effects, including risk of loss, injury, or death, involving rupture of a known earthquake fault or strong seismic ground shaking, and impacts would be *less than significant*.

Liquefaction

Less than Significant Impact. Liquefaction occurs when strong, cyclic motions during an earthquake cause water-saturated soils to lose their cohesion and take on a liquid state. Liquefied soils are unstable and can subject overlying structures to substantial damage. Fine sands and silty sands that are poorly graded and lie below the groundwater table are the soils most susceptible to liquefaction. According to the *Engineering Geology and Geotechnical Engineering Report* prepared in support of the Project, groundwater was not encountered under the Project site within the upper fifty feet, and the Project site is underlain at shallow depths by Santa Barbara Formation bedrock that is sufficiently dense to prevent susceptibility to liquefaction (Appendix A). Therefore, the potential for liquefaction at the Project site is low. All new structures would adhere to applicable seismic design standards. Therefore, the Project would not directly or indirectly cause potential substantial adverse effects, including risk of loss, injury, or death, involving liquefaction, and impacts would be *less than significant*.

Landslides

Less than Significant Impact. The Project site is located on Lavigia Hill, which has moderate slopes and is not within a mapped Seismic Hazard Zone for earthquake-induced landslides (Department of Conservation 2025). While signs of past landsliding have been observed nearby, no active landslides are present on or near the site that could pose a hazard (Appendix A).

Grading for reservoirs, terraces, and access roads may temporarily affect slope stability. However, the Project includes retaining walls, erosion control, and slope stabilization consistent with the California Building Code (CBC), City grading requirements, and hillside protection policies. Vegetation removal would follow the Hillside Vegetation Removal Ordinance ([SBMC] Chapter 22.10), and disturbed areas would be replanted with fire-resistant, slope-stabilizing species.

With these design features and regulatory compliance, the Project would not increase landslide risk. Impacts would be *less than significant*.

7.b) Soil Erosion

Potentially Significant Impact. Soil erosion or the loss of topsoil may occur when soils are disturbed but not secured or restored, to the point where wind or rain events may mobilize disturbed soils, resulting in their transport off the project site. Construction activities involving soil disturbance, such as excavation, stockpiling, and grading could result in increased erosion and sediment transport by stormwater to surface waters.

Construction activities such as grading, excavation, and tree removal would temporarily disturb soil and increase erosion potential at the Vic Trace Reservoir parcel and off-site improvement areas. Approximately 83,000 cubic yards of soil would be exported, primarily from terracing and reservoir excavation. Without controls, disturbed soils could be mobilized by wind or rain and transported off-site.

Although the Project includes erosion control measures—such as compliance with Tier 4 of the City's Storm Water BMP Guidance Manual, preparation of a Stormwater Pollution Prevention Plan (SWPPP), and restoration with slope-stabilizing landscaping—construction could still result in erosion impacts that warrant further evaluation. Impacts are considered ***potentially significant***. To ensure erosion risks are adequately addressed, a detailed analysis will be included in the EIR.

7.c-d) Geologic and Soil Hazards

Landslides and Liquefaction

See discussion of landslides and liquefaction in Section 7.a.

Lateral Spreading

Less than Significant Impact. Lateral spreading typically occurs in loose, saturated soils adjacent to slopes or free faces, such as riverbanks or coastal bluffs. The Project site is underlain by compacted soils and bedrock and is not adjacent to water bodies or unconsolidated sediment deposits. All new structures, including the buried reservoirs, aboveground buildings, and PRV vaults, would be designed in accordance with applicable design standards, which include seismic design criteria to address potential ground deformation. Therefore, the potential for lateral spreading is low, and impacts would be ***less than significant***.

Subsidence

Less than Significant Impact. Subsidence can result from groundwater withdrawal, soil compaction, or the collapse of underground voids. The Project site does not overlay known subsidence zones, and the presence of bedrock and engineered fill reduces the likelihood of differential settlement. The Project site contains a previously abandoned oil well, drilled in 1935 and capped pursuant to State standards. The Project would involve reabandonment of the oil well to modern standards under the oversight of the California Department of Conservation, Geologic Energy Management Division (CalGEM), further reducing any risk of localized subsidence. All structures would be constructed in compliance with the CBC, which includes requirements for foundation design and soil stability. Therefore, the potential for subsidence is low, and impacts would be ***less than significant***.

Sea Cliff Retreat

No Impact. The Project site is located approximately 0.75 miles inland from the nearest coastal bluff, along Shoreline Drive. The Project site is not located on or adjacent to a sea cliff, and no Project components are sited within the bluff erosion hazard zone identified in the City of Santa Barbara's Sea-Level Rise Adaptation Plan (City of Santa Barbara 2021a). Therefore, ***no impact*** would occur.

Expansive or Collapsible Soils

Less than Significant Impact. Expansive soils are typically clay-rich and prone to volume changes with moisture fluctuations, while collapsible soils are loose and prone to sudden settlement. The Project site is underlain with compacted soils and bedrock, and does not exhibit characteristics of expansive or collapsible soils. All structures would be designed in accordance with the CBC, which requires geotechnical investigation and appropriate foundation design to mitigate soil-related hazards. Therefore, the potential for impacts from expansive or collapsible soils is low, and impacts would be ***less than significant***.

7.e) Septic Systems

No Impact. The Project would not include the use of any septic tanks or alternative wastewater disposal systems. *No impact* would occur regarding the adequacy of soils to support a septic and alternative wastewater systems.

7.f) Unique Geological Features and Paleontological Resources

Geologic mapping indicates the Project site is underlain by three geologic units with high paleontological sensitivity: Quaternary marine terrace deposits, Santa Barbara Formation, and Monterey Formation. Additionally, artificial fill, which is considered to have no paleontological sensitivity, has been identified within the Vic Trace Reservoir parcel. However, the extent or depth of artificial fill within the Vic Trace Reservoir parcel has not been mapped, so its precise distribution remains uncertain.

Significant impacts to paleontological resources could include the destruction, damage, or loss of scientifically important paleontological resources or associated stratigraphic data. Ground-disturbing activities (e.g., grading, excavating, trenching) in undisturbed sediments or geologic units with high paleontological sensitivity have the potential to significantly impact paleontological resources. Ground-disturbing activities for the Project are anticipated to include excavations for the two new reservoirs, valve vaults, entry/exit pits for pipeline lining, and PRV station; terracing of sloped portions of the reservoir parcel; and open-trenching for new main alignments and storm drains. These activities would affect previously undisturbed, high-sensitivity sediments. As such, impacts would be *potentially significant*. This impact will be analyzed in detail in the EIR.

Mitigation Measures

Mitigation may be required and will be discussed in detail in the EIR.

8. Greenhouse Gas Emissions

8. GREENHOUSE GAS EMISSIONS Would the project:	Level of Significance
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	Potentially Significant
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	Potentially Significant

Discussion

Issues: Global climate change refers to accelerated changes occurring in average worldwide weather patterns, measurable by factors such as air and ocean temperatures, wind patterns, storms, and precipitation. Climate change is forecasted to result in increasingly serious effects to human health and safety and the natural environment in coming decades, such as more extreme weather, drought, wildfire, sea level rise effects on flooding and coastal erosion, and impacts on air quality, water quality and supply, habitats and wildlife, and agriculture.

Substantial evidence identifies accelerated climate change due to emissions of carbon dioxide and other heat trapping greenhouse gases (GHGs) from human activities. GHGs include carbon dioxide, methane, and nitrous oxide, as well as other smaller contributions from hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. GHG emissions are typically measured in metric tons (MT) of carbon dioxide equivalents (CO_2e) based on global warming potential, which allows for totaling the emissions. Natural processes emit GHGs to regulate the earth's temperature; however, substantial increases in emissions, particularly from fossil fuel combustion for electricity production and vehicle use, have substantially elevated the concentration of these gases in the atmosphere well beyond naturally occurring concentrations.

CO_2 accounts for 83 percent of GHG emissions within the United States as of 2019. California is a substantial contributor of GHGs, with transportation and industrial uses representing the largest sources (41 and 24 percent, respectively). In Santa Barbara, direct sources of GHG emissions are on-road vehicles, natural gas consumption, and off-road vehicles and equipment. Indirect sources (emissions removed in location or time) are electricity consumption (power generation), landfill decomposition (methane releases), and State Water Project transport (electricity use).

California Assembly Bill 32 ([AB 32] 2006 Global Warming Solutions Act) set a target to reduce statewide GHG emissions to 1990 levels by the year 2020. Senate Bill 375 ([SB 375] 2008 Sustainable Communities and Climate Protection Act) requires regional coordination of transportation and land use planning throughout the State to reduce vehicle GHG emissions. CARB established targets for Santa Barbara County to not exceed 2005 per capita vehicle emissions in the years 2020 and 2035.

The City updated its Climate Action Plan (CAP) in July 2024. The CAP update establishes a goal of achieving a 40 percent reduction in per capita GHG emissions compared to 1990 levels by 2030 (consistent with California Senate Bill [SB] 32) and a goal of achieving carbon neutrality by 2035 (ten years sooner than Assembly Bill [AB] 1279 goal of carbon neutrality by 2045).

Impact Evaluation Guidelines: CEQA Guidelines Section 15183.5 establishes a framework for developing a qualified GHG emissions reduction plan to cumulatively reduce GHG emissions and allow CEQA lead agencies to analyze and mitigate the effects of plan- and project-level GHG emissions. The City's 2024 CAP was designed to be consistent with CEQA Guidelines Section 15183.5, includes targets that are consistent with or exceed state goals and an Initial Study/Negative Declaration (IS/ND) has been adopted by City Council.

Projects that are substantially consistent with the underlying demographic projections (i.e., residents and employees) and land use assumptions used in the CAP will be able to tier from the adopted IS/ND where appropriate under CEQA. The CAP relied on the Santa Barbara County Association of Governments (SBCAG) Connected 2050 projections and the land use assumptions for existing uses and densities allowed by land use designations in the City of Santa Barbara General Plan, any associated amendments current as of 2023, and the 2023-2031 Housing Element. In addition, the assumptions account for the maximum buildout allowed by existing zoning districts, zoning overlays, and SBMC ordinances that increase density on top of the baseline density. To streamline the CEQA GHG emissions analysis process, the City has prepared a CEQA GHG Checklist, included in the City's Master Environmental Assessment (MEA) Guidelines for Greenhouse Gas Emissions Analysis, that can be used in environmental review documents to confirm a project is consistent with the CAP emissions reduction strategy.

For projects that exceed the CAP update's demographic projections and assumptions based on existing land use designations and existing maximum densities allowed by zoning, including zoning ordinances as of 2023 related to housing overlays, multi-unit housing, and accessory dwelling units, a different methodology and assessment utilizing quantitative thresholds of significance would be necessary to evaluate GHG emissions impacts. The City's MEA Guidelines for Greenhouse Gas Emissions Analysis includes guidance on how to utilize quantitative thresholds that were developed for purposes of evaluating the level of significance of GHG emissions impacts and how to quantify a project's GHG emissions for comparison to the applicable threshold of significance.

Existing Conditions and Project Impacts

8.a-b) Greenhouse Gases

Potentially Significant Impact. Sources of direct carbon dioxide and other GHG emissions that could result from the project include construction emissions, project-related traffic, and landscaping/ maintenance equipment. Indirect emissions are associated with power generation for electricity consumption. The Project may result in the generation of GHGs that have a significant impact on the environment and conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions. These impacts would be ***potentially significant*** and will be analyzed in detail in the EIR.

Mitigation Measures

Mitigation may be required and will be discussed in detail in the EIR.

9. Hazards and Hazardous Materials

9. HAZARDS AND HAZARDOUS MATERIALS Would the project:	Level of Significance
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	Less than Significant
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	Potentially Significant
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	Less than Significant
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	No Impact
e) For a project located within the SBCAG Airport Land Use Compatibility Plan, Airport Influence Area, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	No Impact
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	Less than Significant
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	No Impact

Discussion

Issues: Hazardous materials issues involve the potential for public health or safety impacts from exposure of persons or the environment to hazardous materials or risk of accidents involving combustible or toxic substances. Hazards issues include the exposure of people or structures to airport hazards, wildland fires, or other types of hazards.

Impact Evaluation Guidelines: Significant impacts may result from the following:

1. Siting of incompatible projects in close proximity to existing sources of safety risk, such as pipelines, industrial processes, railroads, airports, etc.
2. Exposure of project occupants or construction workers to unremediated soil or groundwater contamination.
3. Exposure of persons or the environment to hazardous substances due to the improper use, storage, transportation, or disposal of hazardous materials.
4. Physical interference with an emergency evacuation or response plan.
5. Expose people or structures to risk of loss, injury or death involving wildland fires.

Emergency access is also discussed in Transportation (Section 17). Toxic air contaminants are also discussed in Air Quality (Section 3). Wildland fire hazards are also discussed in Wildfire (Section 20).

Existing Conditions and Project Impacts

9.a) Public Health and Safety

Less than Significant Impact. Construction of the Project would likely involve the use of some hazardous materials, such as vehicle fuels, lubricants, greases, and transmission fluids in construction equipment, and paints, coatings, and adhesives in building construction. Operation of the Project includes limited storage and use of hazardous materials, including diesel within an aboveground fuel tank and materials required for the hypochlorite disinfection system. However, these products would only be used and stored in limited quantities, are generally consistent with existing conditions, and the normal routine use of these products would not result in a significant hazard to residents or workers in the vicinity of the Project site. In addition, operation of the proposed water infrastructure would not result in the production of hazardous waste.

The transport, use, and disposal of hazardous materials used or removed during proposed Project construction and operation would be conducted in compliance with applicable federal, State, and local laws pertaining to the safe handling, transport, and disposal of hazardous materials. This includes the Federal Resource Conservation and Recovery Act (RCRA), which includes requirements for hazardous solid waste management; and the California Department of Toxic Substances Control (DTSC) Environmental Health Standards for the Management of Hazardous Waste (CCR Title 22, Division 4.5), which includes standards for generators and transporters of hazardous waste. Therefore, the Project would result in *less than significant impacts* related to the routine transport, use, or disposal of hazardous materials and the potential release of hazardous materials into the environment.

9.b) Upset or Accidental Release

Potentially Significant. Improper use, storage, transportation, and disposal of hazardous materials and waste during construction could result in accidental spills or releases, posing health risks to workers, the public, and the environment. To minimize these risks, the Project would implement a Stormwater Pollution Prevention Plan (SWPPP) under the National Pollutant Discharge Elimination System (NPDES) General Construction Permit, enforced by the Central Coast Regional Water Quality Control Board. The SWPPP would include best management practices (BMPs) for hazardous materials containment, spill response, and site stabilization.

Construction would also involve the demolition and removal of existing structures that may contain asbestos and/or lead-based paint. If present, the Project Contractor(s) would comply with California Occupational Safety and Health Administration (CalOSHA) regulations, specifically CCR Section 1532.1, which requires testing, monitoring, containment, and disposal of lead-based materials to ensure exposure levels remain below CalOSHA thresholds.

An Environmental Site Investigation conducted in 2023 included sampling for lead, lead-based paint, and asbestos. No soil discoloration or odors were observed, and all detected lead concentrations were below applicable Environmental Screening Levels (ESLs) and within background ranges. No lead, lead-based paint, and asbestos concerns were identified (Appendix B).

The Project also includes re-abandonment of a previously abandoned oil well located beneath the northeast corner of the existing reservoir. Because the well's casing elevation is unknown, locating and capping the well below the new reservoir floor could disturb soil that may contain oil contamination from

the original drilling and construction. This activity presents a potential for accidental release of subsurface contaminants.

Due to the potential for hazardous materials exposure during oil well re-abandonment and structure demolition, impacts are considered ***potentially significant***. This impact will be analyzed in detail in the EIR.

9.c) Schools

Less than Significant Impact. The nearest school to the Project site is Washington Elementary School, located approximately 0.23 miles south of the proposed Vic Trace Outlet Main on Meigs Road. Construction activities would involve the use of diesel fuel, gasoline, motor oil, and similar materials in typical quantities for a project of this scale. These materials would be handled in accordance with applicable regulations, including OSHA Standard 1917.156, which governs fueling locations, liquid fuel handling, and storage practices. Construction personnel would be trained and/or certified to operate equipment safely, minimizing the risk of accidental release.

Operational activities at the Vic Trace Reservoir parcel would occur approximately 0.45 miles from Washington Elementary School and would not involve hazardous materials handling near the school. The Vic Trace Outlet Main would consist of buried water infrastructure and would not require routine maintenance.

Therefore, the Project would have a ***less than significant impact*** related to hazards affecting schools.

9.d) Contaminated Sites

No Impact. Government Code Section 65962.5 requires the California Environmental Protection Agency (EPA) to develop an updated Hazardous Waste and Substances Sites List, also known as the Cortese List. The DTSC is responsible for a portion of the information contained in the Cortese List; other state and local government agencies are also required to provide additional hazardous material release information for the Cortese List. The analysis for this section included a review of the following resources on July 23, 2025, to provide hazardous material release information:

- State Water Resources Control Board (SWRCB) GeoTracker database (SWRCB 2025)
- DTSC EnviroStor database (DTSC 2025)
- California Environmental Protection Agency Cortese List Data Resources (EPA 2025)

Based upon review of these databases, there are no hazardous material sites mapped at, adjacent to, or within 1,000 feet of the Project site. Therefore, the project would not be located on a site included on a list of hazardous material sites compiled pursuant to Government Code Section 65962.5. ***No impact*** would occur.

9.e) Airport Hazards

No Impact. The Project site is not located within the Santa Barbara County Association of Governments' Airport Land Use Compatibility Plan, Airport Influence Area for the Santa Barbara Airport (Santa Barbara County Association of Governments 2023). Therefore, the Project would have ***no impact*** related to airport safety hazards or noise for people residing or working in the Project area.

9.f) Emergency Evacuation and Response

Less than Significant Impact. The Project site is located within a developed residential area subject to wildfire evacuation planning and coastal hazard preparedness. The Project includes both on-site improvements at the Vic Trace Reservoir parcel and off-site improvements within public ROW, including La Coronilla Drive, Dolores Drive, Meigs Road, Ricardo Avenue, and La Vista Del Oceano Drive.

The City's 2021 Community Wildfire Protection Plan identifies Wildfire Evacuation Preplanning Blocks, and the Project site is within STB 14, a residential block that relies on Meigs Road and Cliff Drive as primary evacuation routes (City of Santa Barbara 2021b). The Tsunami Response Plan does not identify the Project site, including the off-site improvement areas, as being within a tsunami inundation zone (City of Santa Barbara 2012).

Temporary construction activities, including trenching for pipeline replacement and PRV station relocation, would occur within public roadways. These activities would be phased and managed with traffic control measures, including signage and flaggers, to maintain access for emergency vehicles and residents. See *Traffic Controls* section of the *Project Description* for a full discussion of proposed traffic controls. Construction staging and worker parking would occur entirely on-site at the Vic Trace Reservoir parcel, minimizing disruption to public streets. The Project would not result in permanent road closures or reconfigurations that would obstruct emergency access and would not generate substantial new vehicle trips during operation that could interfere with emergency access. Therefore, the Project would have a *less than significant impact* involving interference with emergency response plans and emergency evacuation plans.

9.g) Wildland Fire

No Impact. The Project site is not located within a State Responsibility Area or within a Fire Hazard Severity Zone, as designated by the California Department of Forestry and Fire Protection (CalFIRE) (CalFIRE 2025). However, the Project site is located within a Fire Hazard Area Zone as identified by the City's Community Wildfire Protection Plan (City of Santa Barbara 2021b).

Project construction would involve the use of heavy equipment and machinery, which could pose fire risks. However, the Project would comply with regulations related to fire hazards and wildfire safety, including mandatory use of spark arrestors (PRC Section 4442), maintenance of fire suppression equipment during the highest fire danger period (PRC Section 4428), and adherence to standards for conducting construction activities on days when a burning permit is required (PRC Sections 4427 and 4431). Compliance with these regulatory requirements would minimize fire risk during construction. During operation, the proposed project's landscaping would meet the High Fire Hazard Area Defensible Space Requirements from the Community Wildfire Protection Plan, in accordance with Condition of Approval HAZ-2. Therefore, the Project would not increase fire risks at the Project site, and *no impact* involving wildfire would occur.

Mitigation Measures

No mitigation is required.

10. Hydrology and Water Quality

10. HYDROLOGY AND WATER QUALITY Would the project:	Level of Significance
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade groundwater quality?	Less than Significant
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	Less than Significant
c) Substantially alter the existing drainage pattern of the site or area, including through alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: i. result in a substantial erosion or siltation on- or off-site; ii. substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site iii. create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or iv. impede or redirect flood flows?	Less than Significant
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	No Impact
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	No Impact

Discussion

Issues: Water resources issues include changes in surface drainage, creeks, surface water quality, groundwater quantity and quality, flooding, and inundation.

The City's Storm Water Management Program (SWMP) implements the Federal Clean Water Act's NPDES Phase II regulations and is overseen by the State Water Resources Control Board and the Central Coast Regional Water Quality Control Board (RWQCB). The SWMP is implemented through City ordinance provisions (SBMC Section 22.87). The purpose of the SWMP is to implement and enforce a program designed to reduce the discharge of pollutants to the "maximum extent practicable" to protect water quality. The SWMP addresses discharge of pollutants both during construction and after construction.

The City's floodplain management regulations (SBMC Section 22.24) regulate development in identified areas of the City prone to flood, mudslide/mudflow, or flood related erosion. The purpose of the regulations is to promote the public health, safety, and general welfare, and to minimize public and private losses due to flood conditions and to ensure that the owners of buildings within a FEMA Special Flood Hazard Area can obtain flood insurance.

Impact Evaluation Guidelines: A significant impact would result from:

1. Substantial discharge of sediment or pollutants into surface water or groundwater, or otherwise degrading water quality, including temperature, dissolved oxygen, or turbidity.
2. Substantially changing the amount of surface water in any water body or the quantity of groundwater recharge.
3. Substantially changing the drainage pattern or creating a substantially increased amount or rate of surface water runoff that would exceed the capacity of existing or planned drainage and storm water systems.
4. Altering drainage patterns or affecting creeks in a way that would cause substantial erosion, siltation, on- or off-site flooding, or impacts to sensitive biological resources. See also Biological Resources (Section 4).
5. Locating development within floodway or 100-year flood hazard area; substantially altering the course or flow of flood waters or otherwise exacerbating flood hazard to persons or property.

Existing Conditions and Project Impacts

10.a) Water Quality

Less than Significant Impact. Excavation, grading, and other activities associated with construction of the Project would result in soil disturbance which could cause water quality violations through potential erosion and subsequent sedimentation of receiving water bodies. Indirect impacts from construction materials stored onsite, such as stockpiled materials, construction equipment, and trash, could adversely affect water quality.

The Project would be subject to the NPDES Construction General Permit and would require preparation and implementation of a SWPPP. The SWPPP would include best management practices (BMPs) to control erosion, sedimentation, and pollutant discharge. Additionally, the Project would comply with the City of Santa Barbara's Storm Water BMP Technical Guidance Manual and meet Tier 4 post-construction requirements, which apply to projects that disturb more than one acre of land or create significant new impervious surfaces.

Stormwater would be managed through infiltration-based BMPs, including vegetated swales, permeable surfaces, and stormwater storage areas designed to would slow, filter, and infiltrate runoff, reducing the potential for off-site discharge and protecting downstream water quality. The Project would not involve the use of septic systems, nor would it include groundwater extraction that could mobilize existing contamination. The Project site is not located within a designated groundwater recharge area, and the proposed reservoirs would be buried and sealed, which would minimize the potential for leaching or infiltration of contaminants.

Therefore, with adherence to existing regulatory requirements, the Project would not violate water quality standards, violate waste discharge requirements, or substantially degrade surface or groundwater quality. Impacts would be *less than significant*.

10.b) Groundwater Recharge

Less than Significant Impact. The Project would not involve the installation of groundwater wells or the extraction of groundwater for construction or operation. The Project site is located in an area underlain by bedrock and not identified as a significant groundwater recharge zone. The City primarily relies on

surface water sources and imported water, and the Project would not alter the City's water supply portfolio or increase groundwater demand.

The Project would introduce new impervious surfaces to the Project site, including paved access roads, building pads, and utility vaults. However, these impervious surfaces would be offset through the installation of areas of pervious cover, including vegetated swales and landscaped areas. The Project would also implement Tier 4 stormwater management measures in accordance with the City's Storm Water BMP Technical Guidance Manual, which require infiltration-based design strategies to maintain pre-project runoff volumes and support on-site percolation. Furthermore, the Project would include water storage areas and graded drainage features designed to slow and infiltrate runoff, thereby minimizing any potential reduction in groundwater recharge. Given the absence of groundwater extraction, the limited increase in impervious surface, and the inclusion of infiltration-based stormwater design, the Project would not substantially decrease groundwater supplies or interfere with groundwater recharge. Impacts would be *less than significant*.

10.c) Drainage, Stormwater Runoff, and Creeks

Less than Significant Impact. The Project site, including both the on-site improvements at the Vic Trace Reservoir parcel and off-site improvements within public rights-of-way, is not traversed by creeks, rivers, or other surface waters. Therefore, the Project would not result in the alteration of the course of a stream or river.

The Project would involve grading, excavation, and the addition of impervious surfaces such as paved access roads and building pads. These activities would alter existing drainage patterns on the site. However, the Project includes stormwater capture and conveyance design features to maximize on-site infiltration and reduce the risk of flooding. Furthermore, these additions would not result in substantial erosion or siltation due to the implementation of erosion control measures and stormwater BMPs as required by the City of Santa Barbara's Storm Water BMP Technical Guidance Manual (Tier 4 requirements) and the NPDES Construction General Permit, which requires preparation of a SWPPP and implementation of erosion and sediment control BMPs during construction.

To manage post-construction runoff, the Project would include infiltration-based drainage features, such as vegetated swales, pervious surfaces, and stormwater storage areas. These features are designed to slow, filter, and infiltrate runoff, thereby maintaining pre-project runoff volumes and reducing the risk of flooding on- or off-site. The existing storm drain system along Dolores Drive and La Coronilla Park would continue to receive overflow from the Project site, such that no exceedance of system capacity is anticipated.

The Project would not impede or redirect flood flows. The Project site is not located within a floodplain (Federal Emergency Management Agency 2018), and no structures would be placed in areas subject to inundation. The buried reservoirs and associated infrastructure would be designed to withstand storm events and would not obstruct natural drainage pathways.

Therefore, the Project would not substantially alter drainage patterns in a way that would cause erosion, flooding, or exceedance of stormwater system capacity. Impacts would be *less than significant.*

10.d) Inundation

No Impact. The Project site is not located in a flood hazard zone or in an area prone to regular flooding (Federal Emergency Management Agency 2018) and is not in a tsunami or seiche zone (City of Santa Barbara 2012). The Project would not substantially alter the course or flow of flood waters. Therefore, *no impact* related to pollutant release during inundation would occur.

10.e) Conflict with Applicable Plans

No Impact. The Project would be consistent with applicable water quality and groundwater management plans adopted by the City of Santa Barbara and the State of California. The Project would comply with the City of Santa Barbara's SWMP, which implements post-construction stormwater treatment requirements to reduce runoff and prevent pollution. The Project would be subject to Tier 4 of the City's Storm Water BMP Technical Guidance Manual and would include infiltration-based BMPs, such as vegetated swales, pervious surfaces, and stormwater storage areas, to manage runoff and protect water quality.

The Project would also be consistent with the City's Enhanced Urban Water Management Plan (EUWMP), adopted in 2021 as part of the Water Vision Santa Barbara initiative. The EUWMP outlines a long-term strategy for sustainable water supply and infrastructure resilience. The Project directly supports the EUWMP's goals by replacing aging infrastructure to reduce water loss and improve system reliability; enhancing operational flexibility through the construction of two 5 MG reservoirs; improving water quality and system hydraulics; and supporting emergency preparedness and climate resilience.

The Project would not involve groundwater extraction or septic systems.

Therefore, the Project would not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan. *No impact* would occur.

Mitigation Measures

No mitigation is required.

11. Land Use and Planning

11. LAND USE AND PLANNING Would the project:	Level of Significance
a) Physically divide an established community?	No Impact
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating and environmental impact?	Less than Significant Impact

Discussion

Issues: Certain project types have the potential to result in incompatibility with existing surrounding land uses or activities. Typically, development applications for General Plan Amendments, Rezones, Conditional Use Permits, Performance Standard Permits, and certain modifications have the greatest potential to result in land use compatibility issues. Incompatibility can result from a project's generation of noise, odor, safety hazards, traffic, visual effects, or other environmental impacts.

Impact Evaluation Guidelines: Significant impacts may result from a project that would create a physical barrier that would substantially impact circulation within an established neighborhood. Significant impacts may result from a project where an inconsistency with the General Plan, SBMC, or Coastal Land Use Plan (if applicable) would result in an adverse environmental effect. The analysis focuses on regulations, standards, and policies that relate to avoiding or mitigating environmental impacts, and includes an assessment of whether any inconsistency with these standards creates a significant physical impact on the environment.

Existing Conditions and Project Impacts

11.a) Physically Divide a Community

No Impact. The Project does not include any new roads, walls, fences, or other physical barriers that could alter existing vehicular or pedestrian circulation patterns or isolate neighborhoods. All off-site improvements, including pipeline replacements and PRV station relocation, would occur underground with limited aboveground standard accessory equipment within existing public ROW and would not result in substantial permanent changes to neighborhood layout or access. Temporary lane closures or detours during construction would be managed with traffic control measures and would not result in long-term disruption to community connectivity. The Project would not introduce any land use changes, zoning conflicts, or new infrastructure that would isolate parts of the community or restrict access between neighborhoods. Therefore, the Project would not physically divide an established community, and *no impact* would occur.

11.b) Conflict with a Plan or Policy that would Avoid or Mitigate an Environmental Impact

Less than Significant Impact. The Project would not require a General Plan Amendment or rezoning. The Vic Trace Reservoir parcel, not including the portion containing La Coronilla Park, is designated Institutional in the City of Santa Barbara General Plan and zoned RS-15 (Residential Single Unit, 15,000 sq. ft. minimum). The portion of the Vic Trace Reservoir parcel containing La Coronilla Park is designated Parks and Open Space and zoned P-R (Park and Recreation). Off-site improvements are

located within existing public ROW in residential zones (RS-15 and RS-7.5). The proposed utility infrastructure is consistent with these land use designations and zoning regulations. The Project would not introduce new land uses or create land use incompatibilities that could result in environmental impacts. All improvements are related to public water infrastructure and are compatible with surrounding residential and parks and open space uses.

The following provides an initial discussion of potential project consistency or inconsistency with applicable plans and policies.

City of Santa Barbara General Plan

The Project is consistent with the following City of Santa Barbara General Plan policies that are intended to avoid or mitigate environmental impacts:

- **ER1.1 (Resource Protection)**: Protect and enhance natural resources, including water quality and biological resources.
- **PS6 (Water Supply and Infrastructure)**: Maintain and improve water infrastructure to ensure reliable service and emergency preparedness.
- **ER2.2 (Storm Water Management)**: Require the use of best management practices (BMPs) to reduce stormwater runoff and protect water quality.
- **ER4.1 (Air Quality and GHG Reduction)**: Support infrastructure upgrades that reduce emissions and improve system efficiency.
- **OP1.1 (Public Facilities)**: Ensure that public facilities are maintained and upgraded to meet community needs.

City of Santa Barbara Coastal Land Use Plan

As shown in Figure 12, the Project site is not located within the Coastal Zone. The Project would not conflict with Coastal Land Use Plan policies related to public access, scenic resources, or coastal hazards. No coastal development permit would be required.

Ordinance Provisions

The Project would comply with applicable SBMC provisions for development, including zoning requirements, development permitting procedures, grading, building, and landscape design, lighting, energy efficiency, provision of public improvements and utilities, construction provisions, storm water management, fire code provisions, and noise ordinance. The Project would be consistent with the RS-15 zoning and Institutional land use designation for the Vic Trace Reservoir parcel, and with P-R zoning and Parks and Open Space designation for La Coronilla Park.

In summary, the Project would not conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating environmental impacts. Therefore, impacts would be *less than significant*.

Mitigation Measures

No mitigation is required.

12. Mineral Resources

12. MINERAL RESOURCES Would the project:	Level of Significance
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	No Impact
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	No Impact

Discussion

Issues: A mineral is a naturally occurring chemical element or compound formed from inorganic processes (not biological in origin). Minerals include metals, rock, sand, petroleum products, and geothermal resources. The City has no active aggregate operations within its jurisdiction, and no quarry or mine operations are pending reactivation or initiation.

Impact Evaluation Guidelines: A significant impact could occur from projects that result in the loss of known mineral resources, or loss of mineral resource recovery sites including quarries and petroleum extraction sites.

Existing Conditions and Project Impacts

12.a-b) Loss of Known Mineral Resource or Mineral Resource Recovery Site

No Impact. The Project site is located within a highly urbanized area and is currently used for municipal water infrastructure. It does not contain any active mineral extraction operations, quarries, or aggregate resource areas. However, the site includes a previously abandoned oil well located beneath the northeast corner of the existing Vic Trace Reservoir. The well was drilled in 1935, was abandoned in 1935, and is no longer in use.

As part of the Project, the oil well would be re-abandoned to current standards under the oversight of the California Department of Conservation, Geologic Energy Management Division (CalGEM). This activity would ensure the well remains permanently offline and does not interfere with current or future land uses.

The Project would not result in the loss of access to a known mineral resource or a mineral resource recovery site. No active or protected mineral resources are present, and the site is not designated for petroleum extraction or mineral recovery in the City's General Plan. Therefore, ***no impact*** would occur.

Mitigation Measures

No mitigation is required.

13. Noise

13. NOISE Would the project result in:	Level of Significance
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	Potentially Significant
b) Generation of excessive groundborne vibration or groundborne noise levels?	Potentially Significant
c) For a project located within the vicinity of a private airstrip or the SBCAG Airport Land Use Plan/Airport Influence Area, would the project expose people residing or working in the project area to excessive noise levels?	No Impact

Discussion

Issues: Noise issues are associated with siting of a noise-generating land use next to existing noise-sensitive land uses, and/or short-term construction-related noise. Similarly construction techniques such as pile driving and blasting and land uses such as the railroad can present issues of groundborne vibration. If groundborne vibration is excessive, it can impact the integrity of structures and can affect sensitive land uses.

The primary source of ambient noise in the City is vehicle traffic noise. The City Master Environmental Assessment (MEA) Noise Contour Map identifies average ambient noise levels within the City.

Ambient noise levels are determined as averaged 24-hour weighted levels, using the Day-Night Noise Level (L_{dn}) or Community Noise Equivalence Level (CNEL) measurement scales. The L_{dn} averages the varying sound levels occurring over the 24-hour day and gives a 10 decibel penalty to noises occurring between the hours of 10:00 p.m. and 7:00 a.m. to take into account the greater annoyance of intrusive noise levels during nighttime hours. Since L_{dn} is a 24-hour average noise level, an area could have sporadic loud noise levels above 60 dBA which average out over the 24-hour period. CNEL is similar to L_{dn} but includes a separate 5 dB(A) penalty for noise occurring between the hours of 7:00 p.m. and 10:00 p.m. CNEL and L_{dn} values usually agree with one another within 1 dB(A). The Equivalent Noise Level (L_{eq}) is a single noise level, which, if held constant during the measurement time period, would represent the same total energy as a fluctuating noise level. L_{eq} values are commonly expressed for periods of one hour, but longer or shorter time periods may be specified. In general, a change in noise level of less than three decibels is not audible. A doubling of the distance from a noise source will generally equate to a change in decibel level of six decibels.

Guidance for appropriate long-term background noise levels for various land uses are established in the City General Plan Environmental Resources Element Land Use Compatibility Guidelines. Building codes also establish maximum average ambient noise levels for the interiors of structures.

High construction noise levels occur with the use of heavy equipment such as pile drivers, scrapers, rollers, graders, trenchers and large trucks for demolition, grading, and construction. Equipment noise levels can vary substantially through a construction period, and depend on the type of equipment, number of pieces operating, and equipment maintenance. Construction equipment may generate noise levels of more than 80 or 90 dBA at a distance of 50 feet, and the shorter impulsive noises from other construction

equipment (such as pile drivers and drills) can be even higher, up to and exceeding 100 dBA at a distance of 50 feet. Noise during construction is generally intermittent and sporadic, and after completion of the initial demolition, grading and site preparation activities, tends to be quieter.

The Noise Ordinance (SBMC Section 9.16) governs short-term or periodic noise, such as construction noise, operation of motorized equipment or amplified sound, or other sources of nuisance noise. The ordinance establishes limitations on hours of construction and motorized equipment operations, and provides criteria for defining nuisance noise in general.

Aircraft traffic also creates intermittent higher noise levels and is a major source for noise in the communities surrounding the Santa Barbara Airport. The Airport is located outside of the continuous boundary of the City, and areas affected by aircraft noise include several neighborhoods within the City of Goleta, UCSB, and unincorporated areas of the County. The Santa Barbara Airport's Noise Compatibility Program and the Airport Land Use Plan provide noise abatement procedures and policies for the airport to minimize noise; guidelines for placement of noise sensitive land uses near the airport, and mitigation measures to prevent impacts to residential areas from airport noise.

Impact Evaluation Guidelines: A significant noise impact may result from:

Project Noise Generation

Substantial noise and/or vibration from project operations (such as stationary mechanical equipment) or grading and construction activities (such as the use of pile drivers) in close proximity to noise-sensitive receptors for an extensive duration. Exposure to noise levels of 100 dBA for longer than 15 minutes, or 85 dBA for more than 8 hours, has the potential to result in harmful health effects. A vibration study is required for projects that will use pile drivers.

Ambient Noise Levels

Siting of a project such that persons would be subject to long-term ambient noise levels in excess of the Noise Element land use compatibility guidelines as follows. The guidelines include maximum interior and exterior noise levels.

1. Interior noise levels are of primary importance for residences due to the health concerns associated with continued exposure to high interior noises. Projects not meeting interior noise levels would have significant noise impacts.
2. For exterior noise levels, there are two levels of noise:
    a. "Clearly unacceptable" exterior levels are those levels above which it would be prohibitive, even with mitigation, to achieve the maximum interior noise levels, and the outdoor environment would be intolerable for the assigned use. Projects exceeding the maximum "clearly unacceptable" noise levels would have significant noise impacts.
    b. "Normally unacceptable" noise levels are those levels which it is clear that with standard construction techniques maximum interior noise levels will be met and there will be little interference with the land use. Projects below the maximum "normally unacceptable" noise levels would have less than significant noise impacts.
    c. Projects with exterior noise levels exceeding the "normally acceptable" level and below the maximum "clearly unacceptable" level are evaluated on a case by case basis to identify mitigation to achieve the "normally acceptable" exterior levels to the extent feasible and to determine the level of significance of the noise exposure.

The following are the maximum interior and exterior noise levels for common land uses in the City:

- Commercial (retail, restaurant, etc.) and Office (personal, business, professional): Normally acceptable maximum exterior ambient noise level of 75 dBA L_{dn}; clearly unacceptable maximum exterior noise level of 80 dBA L_{dn}; maximum interior noise level of 50 dBA L_{dn}.
- Residential: Normally acceptable maximum exterior ambient noise level of 60 dBA Ldn in single family zones and 65 dBA L_{dn} in non-residential or multi-family residential zones); clearly unacceptable maximum exterior noise level of 75 dBA L_{dn}; maximum interior noise level of 45 dBA L_{dn}.

Aircraft Noise

3. Project site location near the Airport that would result in excessive noise exposure for project residents or employees.

Existing Conditions and Project Impacts

13.a-b) Increased Noise and Vibration Levels

Potentially Significant Impact. Construction of the Project would generate temporary increases in noise and vibration from excavation, demolition, reservoir construction, pipeline installation, and other construction activities. Nearby noise sensitive receptors include single-family residences surrounding the Vic Trace Reservoir parcel and along La Coronilla Drive, Dolores Drive, Meigs Road, Ricardo Avenue, and La Vista Del Oceano Drive.

Noise levels may exceed applicable thresholds during certain phases of construction, and vibration from equipment such as compactors or jackhammers could affect nearby structures. Therefore, impacts associated with construction of the Project may be *potentially significant*. These impacts will be analyzed in detail in the EIR.

Once construction is completed, Project maintenance activities are anticipated to generate similar noise levels as existing conditions. Operational noise impacts would be *less than significant*.

13.c) Aircraft Noise

No Impact. The Project site is not located within the vicinity of the Santa Barbara Airport nor any private airstrip. *No impact* would occur.

Mitigation Measures

Mitigation may be required and will be discussed in detail in the EIR.

14. Population and Housing

14. POPULATION AND HOUSING Would the project:	Level of Significance
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	Less than Significant
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	No Impact

Discussion

Issues: Population and housing issues include induced population growth that would strain environmental resources within the City or require new infrastructure or development, the construction of which could result in environmental impacts. The loss of housing units would displace populations and increase demand for housing within the City.

Impact Evaluation Guidelines: A potentially significant population and housing impact may occur if:

1. Growth inducement, such as provision of substantial population or employment growth or creation of substantial housing demand; development in an undeveloped area, or extension/expansion of major infrastructure that could support additional future growth.
2. Loss of a substantial number of people or housing units, especially loss of lower cost housing.

Existing Conditions and Project Impacts

14.a) Growth Inducing Impacts

Less Than Significant Impact. The Project would not extend major public infrastructure such as water, sewer, or roads in a manner that would facilitate new development. It would not result in substantial employment growth or increase demand for housing. The Project site is located in an urbanized area already served by existing infrastructure. Therefore, the Project would not induce unplanned growth, and impacts would be *less than significant*.

14.b) Housing Displacement

No Impact. The Project does not include any existing residential uses and would not displace any people or housing. Therefore, *no impact* related to displacement would occur.

Mitigation Measures

No mitigation is required.

15. Public Services

15. PUBLIC SERVICES Would the project:	Level of Significance
a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: i. Fire protection? ii. Police protection? iii. Schools? iv. Parks? v. Other public facilities?	Less than Significant

Discussion

Issues: This section evaluates project effects on fire and police protection services, schools, and other public facilities.

Facilities and Services: The General Plan EIR concluded that under existing conditions as well as the projected planned development and all studied alternatives, all public services (police, fire, library, public facilities, governmental facilities, electrical power, natural gas and communications) could accommodate the potential additional growth until 2030. The General Plan EIR also determined that growth in the City under the General Plan would not result in a considerable contribution to cumulative impacts on public services on the South Coast.

Schools: None of the school districts in the South Coast have been designated "overcrowded" as defined by California State law. Per California Government Code Section 66000, the City collects development impact fees from new development to offset the cost of providing school services/additional infrastructure to accommodate new students generated by the development.

Impact Evaluation Guidelines: The following may be identified as significant public services and facilities impacts:

1. Creation of a substantial need for increased police department, fire department, public facility maintenance, or government services staff or equipment.
2. Generation of substantial numbers of students exceeding public school capacity where schools have been designated as overcrowded.

Existing Conditions and Project Impacts

15.a) Fire, Police, Schools, and Other Public Facilities

Less Than Significant Impact. The Project site is located in an urbanized area where all public services are available. The Project is not anticipated to create a substantially different demand on fire or police protection services, library services, or City buildings and facilities than that anticipated in the General Plan EIR.

The Project site location is served by the Santa Barbara Unified School District for elementary and high school, which is not designated as overcrowded as defined by the State of California. The certified General Plan EIR found no significant impacts to police, schools, and public facilities for growth projected for the City in the 2030 timeframe. Therefore, impacts to fire protection, police protection, schools, library services, City buildings and facilities are anticipated to be *less than significant*.

Mitigation Measures

No mitigation is required.

16. Recreation

16. RECREATION	Level of Significance
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	Less than Significant
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	Less than Significant

Discussion

Issues: Recreational issues are associated with increased demand for recreational facilities or loss of or impacts to existing recreational facilities or parks.

Impact Evaluation Guidelines: Recreation impacts may be significant if the project would result in:

1. Increase in demand for park and recreation facilities in an area underserved by existing public park and recreation facilities leading to substantial physical deterioration of existing facilities.
2. Substantial loss or interference with existing park space or other public recreational facilities such as hiking, cycling, or horse trails.
3. Substantial adverse physical impacts associated with the construction or expansion of recreational facilities.

Existing Conditions and Project Impacts

16.a) Existing Recreational Facilities

Less than Significant Impact. The Project site includes La Coronilla Park, a City-designated Neighborhood Park, which is located on the north-western portion of the Vic Trace Reservoir parcel and is currently undeveloped and vegetated. The Project does not propose new residential development or population growth that would directly increase demand on recreational facilities. However, temporary construction activities would affect La Coronilla Park, including underground pipeline upgrades beneath the park, temporary construction access through the park, and temporary closure of public access for up to three months. Disturbed areas would be restored to pre-Project conditions following construction.

Temporary construction impacts to La Coronilla Park are not anticipated to increase the use of other recreational facilities such that substantial deterioration would occur or be accelerated. The Project would have *less than significant impacts* related to existing recreational facilities.

16.b) New Recreational Facilities

Less than Significant Impact. The Project does not include the construction or expansion of recreational facilities. The Project site includes La Coronilla Park, a designated Neighborhood Park, located on the western portion of the Vic Trace Reservoir parcel. However, the Project does not propose any new recreational amenities or upgrades to La Coronilla Park beyond minor underground pipeline improvements and temporary construction access.

All work within La Coronilla Park would be underground, and disturbed areas would be restored to pre-Project conditions following construction. No new recreational features (e.g., trails, playgrounds, sports fields) are proposed, and no expansion of park boundaries or facilities would occur. As the Project would not involve new recreational infrastructure, it would not result in habitat disturbance beyond temporary vegetation removal (which would be minimized through replating), increased use of sensitive areas, increased vehicle traffic or emissions beyond construction-related activity, or increased noise levels beyond temporary construction noise.

Therefore, while the Project would temporarily affect La Coronilla Park during construction, the Project would not include or require the construction or expansion of recreational facilities that would result in adverse physical effects on the environment. Impacts would be *less than significant*.

Mitigation Measures

No mitigation is required.

17. Transportation

17. TRANSPORTATION Would the project:	Level of Significance
a) Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?	Potentially Significant
b) Conflict or be inconsistent with CEQA Guidelines Section15064.3, subdivision (b) (Criteria for Analyzing Transportation Impacts)?	Less than Significant
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	Less than Significant
d) Result in inadequate emergency access?	Less than Significant

Discussion

Issues: Transportation issues include vehicle miles traveled (VMT), access, circulation and safety. Vehicle, bicycle and pedestrian, and mass transit modes of transportation are all considered, as well as emergency vehicle access.

The City General Plan Circulation Element contains policies addressing circulation, vehicle traffic, and alternative mode travel in the City. Alternative mode policies are also contained in other adopted City planning documents, including the Nonresidential Growth Management Program, Pedestrian Master Plan, Bicycle Master Plan, Upper State Street Plan, as well as regional transportation plans.

Impact Evaluation Guidelines: State legislation Senate Bill (SB) 743 revises the approach for analyzing transportation impacts of projects under CEQA. The legislation identifies the use of VMT or similar approaches as the most appropriate measure for determining transportation impacts, shifting away from the level of service analysis that evaluated a project's impacts on traffic conditions on nearby roadways and intersections. The change to VMT is meant to focus development in urban centers where vehicle trips are shorter or where other modes of transportation are supported to encourage land use and transportation planning decisions that reduce and minimize VMT, which is GHG emissions generator.

The State provides screening criteria to quickly identify projects not expected to result in transportation impacts under the VMT methodology which are summarized in the City's Master Environmental Assessment Guidelines for Transportation Analysis. Consistent with State CEQA Guidelines Section 15064.3, projects in areas that are already well served by a major transit stop are presumed to have less than significant transportation impacts. A major transit stop is defined in the State CEQA Guidelines as a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with frequencies of service intervals of 15 minutes or less during the morning and afternoon peak commute periods. Projects located within a high quality transit corridor as identified by SBCAG are presumed to have less than significant VMT impacts. Per the MEA Guidelines (p.3), projects are defined as "small projects" when generating 250 or fewer daily net vehicle trips on an average weekday. Those defined as "small projects" are presumed to have less than significant CEQA transportation impacts. Transit and active transportation projects are also presumed to have a less than significant impact on VMT.

Circulation and Traffic Safety

1. Create or substantially increase potential hazards due to a roadway that has design features (e.g., narrow width, roadside ditches, sharp curves, poor sight distance, inadequate pavement structure) or that supports uses that would be incompatible with the proposed project.
2. Diminish or reduce effectiveness, adequacy, or safety of pedestrian, bicycle, or public transit circulation.
3. Result in inadequate emergency access on-site or to nearby uses.
4. Conflict with regional and local plans, policies, or ordinances regarding the circulation system, including pedestrian, bicycle, and public transportation.

Existing Conditions and Project Impacts

17.a) Bicycle/Roadway/Pedestrian/Public Transit

Potentially Significant Impact. The Project site is located in the Alta Mesa neighborhood of Santa Barbara, characterized as a primarily residential area with multimodal infrastructure. The Project site includes La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road, all of which are local or collector streets.

Transit service in the vicinity is provided by Santa Barbara Metropolitan Transit District. Line 5 (Mesa/La Cumbre) and Line 4 (Mesa/Santa Barbara City College) operate along Cliff Drive and Meigs Road, with the nearest stops located at Meigs Road and La Coronilla Drive, Meigs Road and Red Rose Way, and Cliff Drive and Meigs Road (Santa Barbara Metropolitan Transit District 2025). These routes provide access to Santa Barbara City College, downtown Santa Barbara, and the La Cumbre area. Pedestrian sidewalks occur along both sides of La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road. A Class II bicycle facility is located along Meigs Road and occurs within the Project site (City of Santa Barbara 2016).

Project construction activities, including open-cut trenching, pipeline installation, and PRV station construction, would occur within La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road. These activities would result in temporary lane closures, sidewalk removals, and increased truck traffic. Temporary closures of sidewalks and driveways, as well as detours for pedestrians and cyclists, would occur.

Although all disturbed infrastructure would be restored to pre-Project conditions, these temporary disruptions could substantially affect pedestrian and bicycle access and safety during construction. While the Project would not permanently remove or degrade pedestrian, bicycle, or transit facilities, and would restore all affected infrastructure, the scale and duration of construction activities could result in *potentially significant* temporary impacts to the circulation system. These impacts will be analyzed in detail in the EIR.

17.b) Vehicle Miles Traveled

Less than Significant Impact. The Project site is not located within a Transit Priority Area or within 0.25 mile of a High Quality Transit Corridor, as identified by SBCAG's Transit GIS Storymap (SBCAG 2025). The surrounding area is primarily low-density residential with limited transit service and no major transit stops or corridors that meet the statutory definitions under Public Resources Code Section21064.3 or 21155.

Pursuant to the City of Santa Barbara's Master Environmental Assessment Guidelines for Transportation Analysis, the Project qualifies for screening as a small project that generates 250 or fewer daily net vehicle trips on an average weekday (City of Santa Barbara 2023). These types of projects are generally presumed to have a less-than-significant VMT impact because they do not generate substantial new vehicle trips and are not trip-attractive land uses. The Project involves replacement of existing water infrastructure and does not include new residential, commercial, or employment-generating components. Construction-related trips would be temporary and are not considered in the VMT analysis under CEQA Guidelines Section 15064.3(b), which focuses on long-term operational impacts.

Given the project does not introduce new land uses or increase long-term trip generation, and because it meets the MEA screening criteria for utility infrastructure, the Project is presumed to have a *less-than-significant impact* on VMT.

17.c-d) Safety Hazards/Emergency Access

Short-Term Construction Access and Circulation

Less Than Significant Impact. Standard construction-related conditions of approval would be applied to the Project, including restrictions on the hours permitted for construction trips outside of peak traffic hours, approval of routes for construction traffic, and designation of specific construction staging and parking areas that would not substantially increase hazards during construction or conflict with emergency access to or around the Project site. See *Project Description* for a list of traffic controls and standard conditions related to traffic. Project impacts associated with traffic hazards and emergency access during Project construction would be *less than significant*.

Operational Access and Circulation

Less than Significant Impact. The Vic Trace Reservoir parcel is accessed via La Coronilla Drive, a residential street that connects to Dolores Drive and Meigs Road. Existing access to the Vic Trace Reservoir parcel consists of a one-lane, 20-foot-wide paved road that ascends Lavigia Hill to the reservoir. This road currently accommodates limited City maintenance traffic and is not open to the public. As part of the Project, the existing access road would be replaced with a new, 24-foot-wide asphalt concrete road designed to accommodate two-way vehicle traffic, including large maintenance and emergency vehicles. The new road would follow the general alignment of the existing road but would be widened and improved to meet City of Santa Barbara Fire Department standards for emergency access. Additional improvements on the Vic Trace Reservoir parcel include a fire truck turnaround area, terraced staging zones, and a 12-foot-wide perimeter access road surfaced with turf block or similar material to support fire and utility vehicles. Two 30-foot-wide manual wrought iron gates with Knox boxes and security cameras would control access to the site.

The Project would not introduce any new public roadways or intersections and would not alter existing public street geometry in a way that would create sharp curves, blind spots, or other hazardous conditions. No incompatible uses, such as agricultural or industrial equipment, would be introduced to the area. The Project would improve emergency access to the Vic Trace Reservoir parcel and would not introduce hazardous design features or incompatible uses. Impacts related to inadequate emergency access would be *less than significant*.

Mitigation Measures

Mitigation may be required and will be discussed in detail in the EIR.

18. Tribal Cultural Resources

18. TRIBAL CULTURAL RESOURCES Would the project:	Level of Significance
a) Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section §21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with important cultural value to a California Native American tribe, and that is: i. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code §5020.1.1(k), or ii. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code §5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code §5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	Potentially Significant

Discussion

Issues: Tribal cultural resources are defined in Public Resources Code (PRC) Section 21074.1 and the City's MEA Guidelines for Tribal Cultural Resources as:

1. Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:
   a. Included or determined to be eligible for inclusion in the California Register of Historical Resources; or
   b. Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.
2. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. In applying the criteria set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.

The City's MEA Guidelines for Tribal Cultural Resources include an assessment process to help identify, evaluate, and address potential impacts of proposed projects on tribal cultural resources. The assessment is also intended to ensure that tribes are consulted and have the opportunity to protect and manage cultural resources important to the local Chumash community.

Impact Evaluation Guidelines: Tribal cultural resource impacts are evaluated based on review of available cultural resource documentation, data gathered from records searches, and consultation with tribal representatives. The traditional knowledge tribal representatives possess enables them to identify places of religious and cultural significance to their tribes, based on traditional knowledge, traditional cultural knowledge or indigenous knowledge, or traditional ecological knowledge, relative to sites, features, places, cultural landscapes, sacred places, and objects with cultural value to the tribe.

If a tribal cultural resource is present or if unknown resources have the potential to exist within a project site, the following significance thresholds from Appendix G of the CEQA Guidelines apply:

1. Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value a California Native American tribe, and that is:
   a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or
   b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Existing Conditions and Project Impacts

18.a) Tribal Cultural Resources

Potentially Significant Impact. The City has not completed tribal consultation to date. As the Project site is located in an archaeologically sensitive area, there is a potential that Project construction could encounter archaeological resources that qualify as tribal cultural resources. Impacts to potential tribal cultural resources, if encountered during ground-disturbing activities associated with Project construction, would be *potentially significant*. These impacts will be analyzed in detail in the EIR.

Mitigation Measures

Mitigation may be required and will be discussed in detail in the EIR.

19. Utilities and Service Systems

19. UTILITIES AND SERVICE SYSTEMS Would the project:	Level of Significance
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction of which could cause significant environmental effects?	Less than Significant
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?	Less than Significant
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	Less than Significant
d) Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	Potentially Significant
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	Potentially Significant

Discussion

Issues: This section evaluates project effects on utilities and service systems, including water and sewer service, storm water drainage, electricity, natural gas, telecommunications, and solid waste disposal.

Water

The City of Santa Barbara's water supply comes primarily from the following sources, with the actual share of each determined by availability, level of customer demand, and customer location: Lake Cachuma and Tecolote Tunnel; Gibraltar Reservoir, Devils Canyon and Mission Tunnel; groundwater; State Water Project; desalination; and recycled water. Vic Trace Reservoir receives treated water directly from Cater Water Treatment Plant, which generally treats water supplies from Lake Cachuma, Tecolote Tunnel, Gibraltar Reservoir, Devils Canyon, Mission Tunnel and the State Water Project. Conservation and efficiency improvements are projected to contribute to the supply by offsetting demand that would otherwise have to be supplied by additional sources. The Long Term Water Supply Plan (LTWSP) for the planning period 2020-2050 outlines a strategy to use the above sources to meet the City's projected system demand (potable plus recycled water) of up to 15,160 acre-feet per year (AFY), plus a 10 percent safety margin. The LTWSP concludes that the City's water supply is adequate to meet current and projected demands through at least 2045, even under drought conditions, provided ongoing management and conservation efforts continue.

Wastewater

The maximum capacity of the El Estero Water Resource Center (El Estero) is 11 million gallons per day (MGD), with average daily flows of 6 MGD. In 2011, the City certified a citywide Program EIR for the Plan

Santa Barbara General Plan Update. This EIR concluded that the increased wastewater flows to El Estero are enough to accommodate the growth planned through 2030 for the City. The FEIR also concluded that the increased wastewater flows into the City's collection systems would not substantially contribute to current problems of offsite inflow and infiltration of wastewater flows from the City's system.

Solid Waste

Most of the waste generated in the City is transported on a daily basis to seven landfills located around the County. The County of Santa Barbara, which operates the landfills, has developed impact significance thresholds related to the impacts of development on remaining landfill capacity. These thresholds are utilized by the City to analyze solid waste impacts. The County thresholds are based on the projected average solid waste generation for Santa Barbara County from 1990-2005. The County assumes a 1.2 percent annual increase (approximately 4,000 tons per year) in solid waste generation over the 15-year period. The County's threshold for project specific impacts to the solid waste system is 196 tons per year (this figure represents 5% of the expected average annual increase in solid waste generation [4,000 tons per year]) for project operations. Source reduction, recycling, and composting can reduce a project's waste stream by as much as 50 percent. If a Project generates 196 or more tons per year after reduction and recycling efforts, impacts would be considered significant and unavoidable. Project specific solid water impact as identified above (196 tons per year or more) would also be considered cumulatively significant, as the project specific threshold of significance is based on a cumulative growth scenario. However, as landfill space is already extremely limited, any increase in solid waste of 1% or more of the expected average annual increase in solid waste generation (4,000 tons per year), which equates to 40 tons per year, is considered adverse significant cumulative impact.

Impact Evaluation Guidelines:

Existing Conditions and Project Impacts

19.a) New or Expanded Utilities

Less than Significant Impact. The Project itself does not create new water demand or require additional system improvements beyond those included in the scope. Therefore, impacts related to new or expanded utilities would be *less than significant*.

19.b) Adequate Water Supplies

Less than Significant Impact. The Project would not result in increased water demand beyond existing conditions. The replacement reservoirs are designed to maintain existing storage capacity and improve operational flexibility. According to the City's Water Distribution Infrastructure Plan, sufficient offsite water storage capacity exists to serve the community during construction and operation, including during normal, dry, and multiple dry years. Therefore, the Project would not adversely affect water supply availability and impacts would be *less than significant*.

19.c) Wastewater Treatment Capacity

Less than Significant Impact. The Project would not result in a substantial increase in wastewater generation. The only new wastewater-producing component would be the restroom facility within the proposed valve building, which would generate minimal sanitary wastewater. This volume would be negligible compared to residential or commercial development and would not strain existing

infrastructure. The City has adequate capacity to serve the Project's projected demand in addition to existing commitments, and impacts would be *less than significant*.

19.d-e) Solid Waste Capacity and Reduction Goals and Regulations

Potentially Significant Impact. The City of Santa Barbara's solid waste and recycling services are provided by the City's Clean Community Division, in coordination with MarBorg Industries, which operates the South Coast Recycling and Transfer Station. Solid waste generated by the Project (and not recycled on site) would likely be directed to this facility, a privately-operated diversion and recycling station located in Goleta. After sorting and diversion, residual waste would likely be transferred to the Tajiguas Landfill, a Class III landfill operated by the Santa Barbara County Resource Recovery & Waste Management Division.

The Tajiguas Landfill is located approximately 25 miles west of the Project site and accepts a variety of materials, including construction and demolition debris, green waste, and mixed municipal waste. According to the California Department of Resources Recycling and Recovery, the Tajiguas Landfill has a permitted capacity of approximately 29.4 million cubic yards and a maximum daily disposal limit of 9,000 tons. As of 2023, the landfill has sufficient remaining capacity to accommodate regional waste streams, and its estimated closure date is 2038 (California Department of Resources Recycling and Recovery 2025).

Construction activities associated with the Project would generate solid waste, primarily from demolition of the existing reservoir, valve building, and IT/communications building. Estimated debris includes approximately 4,223 tons of concrete and 194 tons of steel, which would be sorted and recycled where feasible. All waste would be disposed of in accordance with applicable federal, State, and local statutes and regulations, including the City's Ordinance No. 6093 and CALGreen requirements for diversion of at least 65 percent of construction waste. However, due to the scale of anticipated construction and demolition debris, the Project would have a *potentially significant* impact related to short-term solid waste generation. This impact will be analyzed in detail in the EIR.

Mitigation Measures

Mitigation may be required and will be discussed in detail in the EIR.

20. Wildfire

20. WILDFIRE If the project is located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:	Level of Significance
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	Less than Significant
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, or thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	Less than Significant
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel break, emergency water sources, power lines, or other utilities) that may exacerbate fire risks or that may result in temporary or ongoing impacts to the environment?	Less than Significant
d) Expose people or structures to significant risks, including downslope or downstream flooding, landslides, or mud flows, as a result of runoff, post-fire slope instability, or drainage changes?	Less than Significant

Discussion

Issues: Wildfire hazards include exposure of persons and structures to wildfire, air pollutants, and post-wildfire slope instability. Structural losses or damage from wildfires often result from inappropriate siting of development within or adjacent high fire hazard areas, the use of inappropriate construction materials or landscaping, and presence of biofuel mass. Recent wildfire events in California indicate that wildfire behavior is changing, and the duration and frequency of wildfire events are increasing. The 2017 Thomas Fire in Santa Barbara and Ventura Counties was the largest wildfire in California history (at the time) and burned over 250,000 acres. This ultimately led to the subsequent debris flow event in January 2018, which gravely impacted the Montecito community.

The California Department of Forestry and Fire Protection (CAL FIRE) defines fire hazard severity zones based on the presence of biofuel mass, climate, topography, assets at risk (high population centers), and an agency's ability to provide fire protection services to an area. The City contains state responsibility lands within the Very High Fire Hazard Severity Zone (VHFHSZ) within the Santa Barbara foothills. In addition, the City has also designated areas within the City as high fire hazard severity zones within the 2021 Community Wildfire Protection Plan (CWPP). The Project is within STB 14, an existing High Fire Hazard Area.

Impact Evaluation Guidelines: A significant impact would result from:

1. Siting of development in a very high fire hazard severity zone or beyond adequate emergency response time, with inadequate access, infrastructure, or water pressure, or otherwise in a manner that creates or exacerbates a fire hazard.
2. Impairment or conflict with the Community Wildfire Protection Plan or other emergency response plan.
3. Exposing people or structures to post-fire slope instability, flooding, landslides, mud or debris flows.

Existing Conditions and Project Impacts

20.a-c) Wildfire Risk Consistency with Existing Emergency and Wildfire Plans and Regulations

Less than Significant Impact. The Project site is not located within a State Responsibility Area or within a Fire Hazard Severity Zone (CAL FIRE 2025). However, the Project site is located within a High Fire Hazard Area as identified by the City's Community Wildfire Protection Plan (City of Santa Barbara 2021b).

The Project would not substantially impair an adopted emergency response plan or emergency evacuation plan. Construction activities would occur within a secured, City-owned parcel and adjacent public rights-of-way. The Project would include the construction of a new 24-foot-wide paved access road within the Vic Trace Reservoir parcel that meets City Fire Department standards for emergency vehicle access. The Project would also include surveillance systems and controlled access features that would support emergency coordination. No changes to regional evacuation routes or emergency access corridors would occur, and the Project would be consistent with the City's 2021 Emergency Operations Plan.

Due to the Vic Trace Reservoir parcel's slope, vegetative cover, and exposure to wind, the parcel is inherently susceptible to wildfire. However, the Project would incorporate several design features that reduce wildfire risk. UThe Project would implement a landscaping plan that complies with the City's Fire Department Fuel Modification requirements (SBMC Chapter 8.04), using drought-tolerant and fire-resistant native plants. Furthermore, the proposed project's landscaping would meet the High Fire Hazard Area Defensible Space Requirements from the Community Wildfire Protection Plan, in accordance with Standard Condition of Approval HAZ-1. All new structures, including the valve building and IT/communications building, would be constructed of non-combustible materials such as concrete and metal, and would comply with the California Building Code and Wildland-Urban Interface (WUI) standards. These measures would reduce the potential for the Project to exacerbate wildfire risks, which would reduce pollutant concentrations from wildfire smoke or the uncontrolled spread of fire.

The Project would also include infrastructure improvements that enhance fire safety. The new access road would improve emergency ingress and egress, and the perimeter road and terraced areas would provide fire personnel with access for suppression and maintenance. The replacement reservoir overflow and drain pipeline would connect to the City's storm drain system, helping manage runoff during fire suppression activities. \. No fuel breaks or overhead power lines would be installed.

Therefore, the Project would not impair emergency response or evacuation plans, would not introduce infrastructure that exacerbates fire risk, and would not expose people or structures to significant wildfire-related hazards. Impacts would be *less than significant*.

20.d) Post-Wildfire Slope Instability

Less than Significant Impact. The Project site's sloped topography could exacerbate post-fire runoff and erosion. However, the Project includes several design features that reduce these risks, such as terraced grading and retaining walls to stabilize slopes; installation of stormwater BMPs, including vegetated swales and storage areas, to slow and infiltrate runoff; use of pervious surfaces and drainage infrastructure to manage stormwater flow; and compliance with the City's Storm Water BMP Technical Guidance Manual (Tier 4) and Fuel Modification requirements (as adopted in Ordinance No. 6094) to reduce fire intensity and post-fire erosion potential. These measures are consistent with the City's Community Wildfire Protection Plan and Emergency Operations Plan, which emphasize slope stabilization, vegetation management, and resilient infrastructure in high fire hazard areas.

Implementation of these Project design features would minimize impacts related to post-fire flooding, landslides, or mudflows such that impacts would be ***less than significant***.

Mitigation Measures

No mitigation is required.

21. Mandatory Findings of Significance

21. MANDATORY FINDINGS OF SIGNFICANCE	Yes	No
a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	X	
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)	X	
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	X	

Existing Conditions and Project Impacts

21.a) Biological and Cultural Resources

As discussed in Section 4, *Biological Resources*, the Project would not substantially reduce the habitat of a fish or wildlife species, cause a fish or wildfire population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, or substantially reduce the number or restrict the range of a rare or endangered plant or animal. As discussed in Section 5, *Cultural Resources*, and Section 18, *Tribal Cultural Resources*, the Project may have potentially significant impacts related to important archaeological or tribal cultural resources. Therefore, these topics have been identified in this Initial Study as having ***potentially significant impacts*** and will be further evaluated in the EIR.

21.b) Cumulative Impacts

Sections 1 through 20 of this Initial Study consider potential cumulative impacts to environmental resources. As discussed in these sections, the Project could have a considerable contribution to cumulative impacts to aesthetics, air quality, biological resources, cultural resources, geology and soils, hazards and hazardous materials, noise, transportation, and solid waste. Only these impacts have been identified as possibly contributing to cumulative impacts, and result in significant cumulative impacts on the environment. The potential for cumulative impacts related to these issue areas will be further analyzed in the EIR. For all other issue areas, the Project would have either direct or indirect impacts that have been determined to be less than significant, with standard conditions of approval. The assessment of these impacts did not identify residual impacts, or a contribution to a cumulative impact.

These contributions to ***potentially significant*** cumulative impacts will be analyzed in detail in the EIR

21.c) Other Environmental Effects

In general, impacts to human beings are associated with air quality, hazards and hazardous materials, noise, transportation, and wildfire impacts.

As discussed in Sections 1 through 20 of this Initial Study, potentially significant effects on humans (direct or indirect) could occur as a result of this Project. These ***potentially significant*** effects, associated with air quality, hazards and hazardous materials, transportation, and noise, will be analyzed in detail in the EIR.

Project: Vic Trace Reservoir Geotechnical Survey
La Coronilla Drive
Santa Barbara, California

As authorized, we have performed a study to evaluate geotechnical conditions at the Vic Trace Reservoir located to the south of La Coronilla Drive in the City of Santa Barbara, California. The accompanying Engineering Geology and Geotechnical Engineering Report presents the results of our subsurface exploration and laboratory testing programs, as well as our conclusions and recommendations pertaining to geotechnical aspects of project design.

We have appreciated the opportunity to be of service to you on this project. Please call if you have any questions, or if we can be of further service.

Respectfully submitted,

EARTH SYSTEMS SOUTHERN CALIFORNIA

INTRODUCTION

This report presents results of a study performed to evaluate the geotechnical conditions at the City of Santa Barbara's Vic Trace Reservoir at 740 Dolores Drive near La Coronilla Drive. The 10 million gallon potable water reservoir was constructed in 1955. In the ensuing years, voids have formed in various areas surrounding it. One set was identified and repaired in the 1960s along the northeastern edge of the facility near the fill and drain line connections. Over the last 10 years, another set has formed near the southwestern corner, and despite repair efforts, these voids have continued to enlarge. Concerns exist as to whether the voids threaten the integrity of the reservoir.

The purpose of the geotechnical study that led to this report was to analyze the geology and soil conditions of the site to help determine the cause of void creation, evaluate the impact of the voids on the reservoir, and to provide recommendations to remediate the affected areas of the facility. Geotechnical conditions that were analyzed included potential geohazards, both natural and those that could be experienced as a result of void formation, surface and subsurface soil types, soil expansion potential, and the presence or absence of subsurface water. The scope of work included:

1. Reviewing reservoir construction documents, subsequent inspection and repair reports provided by the City of Santa Barbara with respect to the Vic Trace Reservoir.
2. Reconnoitering and geologically mapping the site.
3. Reviewing stereographic pairs of aerial photographs taken of the site and surrounding areas between 1956 and 2010.
4. Reviewing pertinent geologic literature.
5. Utilizing Geosites Locators to perform a Ground Penetrating Radar survey of the paved areas immediately around the reservoir.
6. Drilling, sampling, and logging three bucket auger borings, seven hollow-stem auger borings, and four backhoe pits to study geologic, soil, and groundwater conditions.
7. Laboratory testing of samples obtained from the subsurface exploration to determine physical and engineering properties of site soils.
8. Consulting with City representatives and design professionals.

9. Analyzing the geotechnical data obtained.
10. Preparing this report.

Contained in this report are:

1. Descriptions and results of field and laboratory tests that were performed.
2. Discussions pertaining to the local geologic, soil, and groundwater conditions.
3. Conclusions pertaining to geohazards that could affect the site.
4. Conclusions and recommendations pertaining to potential remedial site grading and structural design.

SITE DESCRIPTION AND HISTORY

Vic Trace Reservoir is located east of Dolores Drive and south of La Coronilla Drive in the City of Santa Barbara (see Vicinity Map in Appendix A). The reservoir, which was constructed in 1955, is 380 feet long by 248 feet wide and 20 feet deep. The original grading plan (titled Plot Plan and Typical Sections by James M. Montgomery, 1954) indicate that the nearly flat bottom of the reservoir was cut into natural materials, and that the finished surfaces at the perimeter were underlain by cut and fill areas. Interior reservoir slopes had gradients of 2:1 (horizontal to vertical).

Fill slopes surrounding the northwest and southwest sides of the reservoir were originally planned at 2.5:1 (according to the 1954 plan), but it appears that they were actually built at 2:1. Finished grades at the pavement surrounding the reservoir were originally planned to be at 455 feet above sea level, whereas existing grades are at about 464 feet (based on City of Santa Barbara topographic maps). (Part of this discrepancy might be resolved by a bench mark shown on the pre-1988 quadrangle maps with an elevation of 459, and more recent maps by the City of Santa Barbara showing it with an elevation of 463 feet.) Based on interpretation of existing topography and aerial photographs taken in 1956 versus the plan, it appears that originally proposed fills to the northeast of the reservoir encompassed areas that were larger than those originally planned, whereas an fill slope that was to be located at the southeastern corner was not built.

LeRoy Crandall and Associates (Crandall) responded in 1963 to reports of cavern formation below the paved berm adjacent to the catch basin on the northwestern side of the reservoir. Exploration consisted of drilling, downhole logging, and sampling 11 borings ranging in depth from 10 to 20.5 feet below the berm grade surrounding the reservoir. Crandall concluded that the caverns formed by water migrating through a combination of shrinkage cracks in the berm area and gopher holes. The relatively flat gradient of the berm was assumed to play a part in that it allowed water to stand for periods of time, thus allowing seepage into the conduits originally formed by the cracks and burrows. Ongoing flow caused erosion and enlargement of the conduits. It is our understanding that the caverns and voids observed during the Crandall study were repaired by overexcavation and recompaction, or by pressure grouting.

Additional voids were noted by City of Santa Barbara staff within the last 10 years in the berm near the southwestern corner of the reservoir. When first observed by Earth Systems on May 14, 2013, the largest void in that location was found to extend downward to at least 9 feet below the berm grade.

Fill slopes to the southwest of the reservoir are covered mostly with a growth of grasses and weeds, whereas fill slopes to the northeast are primarily covered in ice plant. Natural slopes have a variable growth of light chaparral. Although all non-paved areas of the site show evidence of an abundance of animal burrows, they are most common in the fills.

GEOLOGY

Vic Trace reservoir is located on the Mesa area of the City of Santa Barbara, which in turn lies in the western Transverse Ranges. The Santa Barbara area and the Transverse Ranges are characterized by ongoing tectonic activity, where Tertiary and Quaternary sediments have been folded and faulted along predominant east-west structural trends. Although there are several faults located within the region, the nearest known fault of significant activity (i.e. the Lavigia fault, also known as the North Channel Slope fault) is located approximately 1,000 feet south of the subject site. The project area is not located within any of the "Fault Rupture Hazard Zones" that have been specified by the State of California (C.D.M.G. 1972, Revised 1999).

Bedrock underlying the site is the Santa Barbara Formation (Qsb) of Pleistocene age. The Santa Barbara Formation is comprised of shallow marine origin. Units encountered in the field study included massive to crudely bedded, poorly consolidated sands and silts. Soft sediment structures were also encountered, and are interpreted to be representative of syndepositional formation during aggradation, in which loading led to de-watering of pores. Escaping pore water formed sand dikes and intrusions which also obscured primary bedding features.

Artificial fill (af) was encountered in most of the borings drilled through the paved berms along the northwestern and southwestern sides of the reservoir, as well as the flat area northeast of the facility. Based on interpretation of aerial photographs taken in 1956, it appears that the fill that was encountered in the subsurface investigation was placed during grading for the reservoir. Fill materials were found to consist primarily of silty sands and sandy silts. Fill thicknesses appear to be greatest under the berm along the southwestern side of the reservoir, with estimated depths ranging up to about 14.5 feet below the paved surface.

Strikes of bedding measured in units of the Santa Barbara Formation within Bucket Auger Borings BA-1 and BA-3 were northerly orientated, and ranged from N26°W to N42°E. (Bedding attitudes could not be measured in Boring BA-2 due to the massive nature of the native materials underlying artificial fill materials.) Due to the numerous expressions of soft sediment deformation in the bedrock units, and possibly the proximity to the axis of an anticline, dips were found to be variable, ranging from 12° to 15° down to the north and 12° to 15° down to the south, with both dip directions observed within each boring. Regional mapping appears to indicate that the southward dips are more common in the area.

No faults were observed to be located on or trending into the subject property during the field study, during reviews of the referenced geologic literature, or during review of the aerial photographs taken of the site.

Landforms that could potentially be representative of a landslide were interpreted from air photos to be approximately 400 feet (minimum) southeast of the southeastern corner of the reservoir. None of the referenced geologic maps show the feature to be a landslide.

A debris flow (Qdf) located approximately 175 feet northwest of the northwest corner of the reservoir was observed in aerial photographs. It appears likely that the debris flow formed in about 1995.

GEOLOGIC HAZARDS

Geologic hazards that can potentially impact a site include seismic shaking, fault rupture, landsliding, liquefaction and flooding.

Seismic Shaking

Although the site is not within a State-designated "fault rupture hazard zone", it is located in an active seismic region where large numbers of earthquakes are recorded each year. Historically, major earthquakes (i.e. those with Richter magnitudes greater than 7.0) felt in the vicinity of subject site have originated from faults outside the area. These include the December 21, 1812 "Santa Barbara Region" earthquake, that was presumably centered in the Santa Barbara Channel, the 1857 Fort Tejon earthquake, the 1872 Owens Valley earthquake, and the 1952 Arvin-Tehachapi earthquake.

It is assumed that the 2010 California Building Code will be applicable to the proposed project. This building code introduces several seismic design parameters that are primarily influenced by the geographic site location with respect to active and potentially active faults, and with respect to subsurface soil or rock conditions. The seismic design parameters presented herein were calculated by determining the jobsite coordinates (34.4047° north latitude, and 119.7158° west longitude), entering them into the U.S.G.S. Ground Motion Parameter Calculator for Site Class B soils, then entering the calculated "short period" and "one second" spectral responses into a spreadsheet that adjusts for the actual site class of soils (Site Class C) and Occupancy Category IV (i.e. Critical Structures). For the Maximum Credible Earthquake, the Short Period Spectral Response (S_S) was found to be 1.955 g, and the 1 Second Spectral Response (S_1) was found to be 0.737 g. For design purposes, the Short Period Spectral Response (S_{DS}) was found to be 1.303 g, and the 1 Second Spectral Response (S_{D1}) was found to be 0.639 g. (A listing of the calculated 2010 CBC and ASCE 7-05 Seismic Parameters is presented in Appendix C of this report. These values are appropriate for a 10% probability of exceedence in 50 years.)

Table 1 (see Appendix C) lists the significant "active" and "potentially active" faults within a 63-mile (100-kilometer) radius of the subject site. The distance between the site and the nearest portion of each fault is shown, as well as the respective estimated maximum earthquake magnitudes, and the deterministic mean site peak ground accelerations. (It should be noted that the North Channel Slope fault is considered herein to be equivalent to the Lavigia fault as well as part of the Mesa fault complex.)

Fault Rupture

Surficial displacement along a fault trace is known as fault rupture. Fault rupture typically occurs along previously existing fault traces. As mentioned in the "Structure" section above, no known fault traces were observed to be crossing the site. As a result, it is the opinion of this firm that the potential for fault rupture on this site is low.

Landsliding

As mentioned previously, there are possible signs of landsliding near the site, but no existing landslides were observed on the facility, or within a distance that poses a hazard to the reservoir.

It should be noted that a generalized "landslide potential" classification by Bezore and Wills (2000) includes the site and much of the Mesa area in a "high" risk zone. The report also indicates that landslides in the vicinity of the subject site are "common to very common", and that bedrock units are "generally softer, weaker, and less resistant to erosion". The draft Seismic Safety Element (Rodriguez Consulting, Inc., 2013) has a similar characterization of stability of areas in the general vicinity of the site. However, bedding within the Santa Barbara Formation below the subject site is crudely defined and discontinuous. General indications are that bedrock dips southwesterly, which is neutral to the steepest slope to the southeast of the reservoir, and this is typically considered to be a relatively stable geologic condition.

The "Analyses of Stability of Descending Slopes" section elsewhere within this report includes detailed engineering evaluation of the site's slope stability.

Liquefaction

Earthquake-induced vibrations can be the cause of several significant phenomena, including liquefaction in fine sands and silty sands. Liquefaction results in a loss of strength and can cause structures to settle or even overturn if it occurs in the bearing zone. Liquefaction is typically limited to the upper 50 feet of soils underlying a site.

Fine sands and silty sands that are poorly graded and lie below the groundwater table are the soils most susceptible to liquefaction. Soils that have I_c values greater than 2.6, soils with plasticity indices greater than 7, sufficiently dense soils, and/or soils located above the groundwater table are not generally susceptible to liquefaction.

An examination of the conditions existing at the site, in relation to the criteria listed above, indicates the following:

1. Groundwater was not encountered under this site within the upper 50 feet.
2. The facility is underlain at shallow depths by Santa Barbara Formation bedrock that is sufficiently dense to prevent susceptibility to liquefaction.

Based on the above, it is the opinion of this firm that a potential for liquefaction does not exist at this site.

Flooding

Earthquake-induced flooding types include tsunamis and seiches. Due to the inland location of the site, hazards from tsunamis and seiches are considered extremely unlikely. As a result, seismically-induced flooding should not be considered a potential hazard.

The site is located within an area designated by FEMA (2012) as an "area determined to be outside the 0.2% annual chance floodplain". As a result, it appears that the hazard posed by storm-induced flooding is low.

CURRENT GEOTECHNICAL CONDITIONS

Most of the near-surface soils underlying the reservoir include Santa Barbara Formation units below the northeastern berm, and artificial fill under most of the other berm areas. Old artificial fill soils encountered within the borings are generally characterized by variable blow counts and in-place densities. Signs of krotovina (i.e. infilled burrows) were relatively common within the upper 15 feet. Samples of Santa Barbara Formation units yielded relatively high blow counts and in-place densities. Testing indicates that soils under the berms are in the "very low" to "low" expansion ranges. [A classification of soil expansion ranges is included in Appendix B of this report.]

Paved areas around the reservoir perimeter are relatively flat, although the original design was to have all water flow toward a catch basin on the northwestern side of the reservoir. Based on mud stains, it appears that water gathers at the southwest and northwest corners of the facility. It is likely that the ponding has been caused by fill settlement over time.

The Ground Penetrating Radar (GPR) study of the paved berm areas identified some anomalies in the subsurface below the existing pavement, including the large, previously identified void under the southwestern corner of the facility, and a small, nearly circular void near the catch basin. Additional exploration was performed to evaluate the anomalies, and the majority of those that were identified along the northeastern berm near the catch basin were found to be dense, not voided, and were probably within repairs done in 1963 as recommended by Crandall. However, the circular void between Stations 1+75 and 1+80, once opened, was found to extend to a depth of about six inches, with soft soils below (Photo No. 1).

Despite the moderately high to high in-place densities of the soils, numerous burrows were noted throughout the facility. The concentration of burrows on the slope to the southwest of the facility was especially high, and the sizes of surface burrow orifices were larger there than in other areas of the site. This was especially notable immediately adjacent to the southwestern corner of the reservoir, where the large void is located under the paving.

Exploration of the slope area below the southwestern side of the facility was performed with a backhoe so that three-dimensional views of the subsurface could be generated. Numerous nearly cylindrical-shaped burrows with diameters ranging from 2 inches to 8 inches were observed in the upper 3.5 feet of Backhoe Trench Nos. T-1, T-2, and T-4 (see Photo Nos. 2 and 3). However, the most significant features that were observed (in Trench T-2) were subsurface erosional channels encountered at depths ranging from about 3 to 9.5 feet below the ground surface (Photo No. 4). The largest erosional channel was approximately 5 feet high and 4 to 12 inches wide with a meandering configuration trending down to the southwest. Water fed via fire hose into the void at the southwestern corner of the facility by Earth Systems staff exited the slope through the larger of the observed erosional channels (Photo No. 5), although it could not be verified if all the water exited at that point. The exit point corresponded to an area where light colored soils had accumulated above the growth of weeds and grasses near the toe of the fill slope (Photo No. 6).

Trench T-3 was excavated about 75 feet below Trench T-2, and below the accumulation of soils at the toe of the fill slope. The extent of burrowing was far less severe than within the other trenches, and none of the water fed into the void exited through Trench T-3 or areas adjacent to T-3 below the fill slope.

Another area of accumulated light-colored soil was noted below Trench T-4, which was excavated approximately 170 feet northwest of Trench T-1. However, no anomalies were found by the GPR in the paved area above T-4, and the extent of burrowing appeared less severe than the area near the other trenches. Regardless of the lesser amount of evidence, formation of additional erosional channels could be occurring within this area at present.

No voids have been noted by City Staff or by the GPR performed in the paved areas of the facility that are underlain by native soils, i.e. the northeast flank and the eastern half of the southeastern flank.

Samples of near-surface soils were tested for pH, resistivity, soluble sulfates, and soluble chlorides to provide data for evaluating corrosivity or reactivity of various construction materials (such as concrete and piping) with on-site soils. (Test results are provided in Appendix B.) It should be noted that sulfate contents (ranging from 19

mg/kg to 130 mg/kg) are in the "S0" (i.e. "negligible" severity range of Table 4.2.1 of ACI 318; therefore, it appears that special concrete designs will not be necessary for any future improvements based on these measured sulfate contents. Based on criteria established by the County of Los Angeles, measurements of resistivity (1,800 ohms-cm to 4,900 ohms-cm) of near-surface soils indicate that they are "corrosive" to "moderately corrosive" to ferrous metal (i.e. cast iron, etc.) pipes.

Groundwater was not encountered in any of the borings, including Boring BA-3, which was drilled to a depth of 50 feet below the ground surface in a relatively low area of the property. Furthermore, no unusually moist zones were encountered within the borings drilled from the perimeter of the facility to depths of at least 10 feet below the bottom of the reservoir. Thus, based on the information gathered from the borings and trenches, it does not appear that the reservoir is leaking.

ANALYSES OF GROSS STABILITY OF EXISTING SLOPES

Two geologic cross-sections were constructed through the descending slopes below the reservoir where the gradients were steepest and the heights were greatest (see Site Plan/Geologic Map). Geologic Cross-Section along A-A' was constructed along an east-west alignment to the west of the reservoir, and Geologic Cross-Section along B-B' was constructed along a southeast to northwest alignment through the southeastern corner of the reservoir. Subsurface geometry was based on data collected from the bucket auger borings drilled on the site. Surface grades were based on elevations shown on the City of Santa Barbara topographic map of the area.

Density data were based on averaging results of moisture/density tests. General strength parameters for Santa Barbara formation units and existing artificial fill soils were based on averages of the shear strength data from laboratory test results for the appropriate material types provided in Appendix B of this report. Santa Barbara formation units were considered to be anisotropic within Geologic Cross-Section along A-A', with along-bedding strengths equal to the "lower bound" strength measured among shear tests performed on clays within the formation. Peak strengths were utilized for seismic screening analyses, and ultimate strengths were used for analyses of static conditions, with the exception that the lower-bound ultimate

strengths were used for along-bedding strengths for clays for both static and seismic conditions. (Scatter diagrams of the direct shear data are provided in Appendix B.)

Summaries of the soil data used in the stability analyses are as follows:

Material Type	Moist Density	Peak Cohesion	Ultimate Cohesion	Peak Angle	Ultimate Angle
Qsb*	117.7 pcf	645 psf	170 psf	29.1°	30.6°
Qsb**	117.7 pcf	30 psf	30 psf	30.5°	30.5°
af	122.7 pcf	0 psf	0 psf	42.0°	34.3°

* = General parameters for Santa Barbara Formation
** = Along-bedding (lower bound) parameters for clay samples of Santa Barbara Formation

Psuedostatic conditions were analyzed using "screening procedures" discussed in SCEC's guidelines (2002) for evaluation of slope stability. To perform the screening procedure, the seismic coefficient (k_{eq}) was determined based on the following parameters:

MHA_r (firm rock acceleration) = 0.52g [equal to SDS (1.303g) divided by 2.5];
Design earthquake = 7.5 Mw;
Distance to seismic source = 2 km;
Threshold displacement = 5 cm;
Factor f_{eq} = 0.569.

Based on these factors, and the equation $k_{eq} = f_{eq}(MHA_r/g)$, k_{eq} was found to be equal to 0.296.

Bedding planes with the Santa Barbara formation are generally poorly developed and, as such, are considered relatively discontinuous. However, Geologic Cross-Section along A-A' depicts continuous bedding planes dipping at about 12° down to the west. Although the overall topography is relatively gentle [about 3.5:1 (horizontal to vertical)] to the west of the reservoir, and rotational types of failures would be unlikely, along-bedding failures were analyzed while assuming continuous clay bedding planes underlie the slope.

Stability along Section A-A' was analyzed using Janbu's Method for analyzing translational failure types (BLOCK2) where active and passive portions of sliding surfaces were generated according to Rankine theory, as implemented by the GSTABL7 program. Static conditions were analyzed, and a "seismic screening" analysis was performed. In each analysis, 500 trial failure surfaces were initiated from an area near the toe of slope, and run essentially parallel to bedding orientations to areas near the berm supporting the west wall of the reservoir.

For static conditions, the minimum factor of safety along Section A-A' was found to be 2.33, which is greater than the minimum requirement of 1.5. For the seismic screening analysis, the minimum factor of safety was found to be 1.09, which is greater than the minimum requirement of 1.0; thus, no significant displacements would be expected. Based on these analyses, deep-seated translational failures would not be anticipated to the west of the reservoir, or through the areas northwest of the reservoir, where slope heights are less, and slope gradients are similar.

Additional analyses were run through the fill slope illustrated on Section A-A'. Translational failures would not be anticipated through the fill; thus stability was analyzed using Janbu's Method for analyzing circular failure types, as implemented by the GSTABL7 program. One thousand trial failure surfaces were initiated from each of four locations near the toe of the steepest portion of the fill slope, and the minimum factors of safety among the trial surfaces were determined.

For static conditions, the minimum factor of safety through the existing fill in Section A-A'' was found to be 1.72, which is greater than the minimum requirement of 1.5. For the seismic screening analysis, the minimum factor of safety was found to be 1.15, which is greater than the minimum requirement of 1.0; thus, no significant displacements would be expected. Based on these analyses, deep-seated rotational failures within the existing fills would not be anticipated, although it should be noted that continued subsurface erosion could reduce the strength of the fill to the point where failures could be conceivable.

Geologic Cross-Section along B-B' illustrates the natural slope below the southeastern corner of the reservoir. In this area, bedding planes dip into the slope; thus, planar or block-type failures would not be anticipated. For this situation, where translational

failures would be considered unlikely, stability was analyzed using Janbu's Method for analyzing circular failure types, as implemented by the GSTABL7 program. Two thousand trial failure surfaces were initiated from four locations near the toe of slope, and the minimum factors of safety among the trial surfaces were determined.

For static conditions, the minimum factor of safety along Section B-B' was found to be 1.84, which is greater than the minimum requirement of 1.5. For the seismic screening analysis, the minimum factor of safety was found to be 1.26, which is greater than the minimum requirement of 1.0; thus, no significant displacements would be expected. Based on these analyses, deep-seated rotational failures along the slope would not be anticipated.

(Plots of slopes showing the failure surfaces and minimum factors of safety are provided in Appendix E, as are summaries of the input and slice data. The geologic cross-sections are attached in Appendix A.)

ANALYSES OF SURFICIAL STABILITY OF PROPOSED REMEDIATED SLOPES

The surficial stability of soils expected to be exposed in remediated slope were analyzed using the Orange County Method. Strength parameters determined from direct shear testing of remolded samples of the existing fill materials comprising the slopes were utilized. The slope gradient was assumed to be 2:1, which is the existing gradient, and is also assumed to be the gradient of the remediated slope. The depth of saturation was assumed to be 4 feet.

With no reinforcement, the factors of safety for surficial stability were found to range from 0.66 to 0.77, which are all below the required minimum of 1.5. (Calculations are provided in Appendix E.) Factors of safety below 1.5 are considered indicative of potential surficial instability at the slope face. As a result, the data appears to indicate that proposed slopes, if not reinforced in some manner, would not be surficially stable.

Fill slopes reinforced with geogrids were considered as an appropriate alternative. Remedial fill slopes consisting of reworked fill materials that currently comprise the berms along the southwest and northwest sides of the reservoir were analyzed with Triaxial BX-1200 geogrids on 1.5-foot vertical spacings and 9.8-foot embedment depths.

The same parameters discussed previously for surficial stability were utilized in this analysis as well. Factors of safety were found to exceed 1.5, which are acceptable.

GEOTECHNICAL CONCLUSIONS AND RECOMMENDATIONS

Based on the studies described herein, it appears that a combination of poor drainage in the paved areas of the facility, formation of cracks and seams in the pavement, and extensive animal burrowing that extended from outside the fenced area to areas under the pavement have resulted in conduits in which water could flow and erode soils in the subsurface. Because the soils are susceptible to erosion, ongoing flows have enlarged the conduits by eroding the sides and lower sections, and flows have probably been significant during storm events. As the conduits enlarged, soils immediately underlying the points where the majority of water enters the subsurface, i.e. the southwestern facility corner, have been undermined; thus resulting in the void currently observed. (This process is similar to that opined by Crandall in 1963 with respect to northwestern flank voids.)

Because the conduits within which the water migrates are somewhat limited in size, it does not appear that the reservoir is unsafe at this time. However, repairs should be made to the voids to allow soils on the perimeter to continue to provide lateral support to the reservoir. In addition, measures should be implemented to reduce infiltration of water into the subsurface from the facility pavements.

The extent and quality of remediation of observed and interpreted features will depend on budgets available to the City, and whether short-term or long-term solutions are desired.

The following measures should be considered for short-term solutions:

Remove the pavement from the void areas shown on the attached Geologic Map. After water levels are reduced in areas adjacent to remedial work zones, void walls and bottoms should be trimmed until loose soils are completely removed, and the bottom of the excavation is level. If voids wider than 15 feet (as measured parallel to reservoir walls) are encountered within 10 feet of the reservoir walls, shoring may be necessary

to protect the walls prior to making the excavations for remedial work. (Alternatives can be provided once work begins and actual conditions can be observed.)

Where space is available (i.e. in directions away from the reservoir), the excavation should be stepped so that vertical exposures are no more than 3 feet high, and the overall gradient (counting the steps) is no steeper than 1.5:1 (horizontal to vertical). The intent is to expose conduits that have been fed through the voids, and create a safe working area for crews to achieve the next remedial steps.

Existing voids and/or erosional conduits encountered within the void excavations should be filled with controlled low-strength material (CLSM) applied directly into the conduits under pressure.

The enlarged void excavations should be backfilled with fill compacted to a minimum of 90% of maximum dry density, or with CLSM. If soil backfill is preferred, it would be prudent to utilize a burrowing animal-resistant barrier between the backfill soil and the existing soils on the outside edges of the excavation. Burrowing animal resistant barriers could potentially include certain kinds of geogrid, such as Tensar TX-5, and should probably not include metal fencing because of the corrosion potential of on-site soils.

Once the excavations are backfilled, grades should be adjusted to allow positive drainage away from the void areas, and from other areas where water currently ponds near the northwestern and southwestern facility corners. One possible solution to this issue would be to install additional catch basins, and construct storm drains down the adjacent slopes to velocity reducing structures below the toes of the fill slopes.

In any case, measures should be undertaken to prevent water from infiltrating the soils below the facility berms wherever possible. This could be accomplished by utilizing a geotextile liner below the repaved surface, or repaving could be done without the liner, but with the caveat crack sealing would be a regular maintenance item at least three or four times a year. Rapid surface drainage might alleviate the need for the liner.

If a more permanent solution is to be undertaken, the following should be considered:

Fill slopes below the western end of the southeastern flank, the southwestern flank, and much of the northwestern flank exhibit evidence of a severe burrowing animal problem. Most of the burrows appear to be limited to depths of about 3.5 feet (based on observations made in the backhoe pits). However, krotovina (i.e. an abandoned burrow that has been filled with organic material and soil from other soil horizons) were observed in samples obtained from depths as deep as 10.25 feet in Borings B-4 and B-7, and the erosional channels observed in Trench T-2 extended to depths of 9.5 feet below the slope face. Other erosional channels may be in the formative stages, particularly in the vicinities of Trench T-4 and Boring B-2. These voids are significant, and if they continue to enlarge, they could cause additional settlement and/or a decrease in stability.

Because of the voids, it might be prudent to reconstruct the fill slopes, at least below the southwest flank of the facility, where fill slopes are highest and the burrowing problems appear to be most significant. This should begin by removing the asphalt and concrete paving along the sides to be reconstructed to check further for additional, unidentified voids and/or voids. Repairs of voids within 10 feet of the reservoir edge should be repaired as described in the temporary measures provided above.

Any hillside grading or construction of fill slopes should conform to the minimum standards listed in Appendix J of the 2010 California Building Code. It is recommended that the Geotechnical Engineer and Engineering Geologist review the grading plans prior to grading and site development.

The existing ground surface should be initially prepared for grading by removing all vegetation, trees, large roots, debris, other organic material and non-complying fill. Organics and debris should be stockpiled away from areas to be graded, and ultimately removed from the site to prevent their inclusion in fills. Voids created by removal of such material should be properly backfilled and compacted. No compacted fill should be placed unless the underlying soil has been observed by the Geotechnical Engineer.

Fill slopes should be keyed and benched into firm natural ground. The keys should be tilted into the slope, should be a minimum of 12 feet wide, and should be a minimum of 2 feet deep on their outside edge. Backdrains should be placed under the fills as described below.

On-site soils may be used for fill once they are cleaned of all organic material, rock, debris and irreducible material larger than 8 inches. Fill and backfill placed at near optimum moisture in layers with loose thickness not greater than 8 inches should be compacted to a minimum of 90% of the maximum dry density obtainable by the ASTM D 1557 test method.

To reduce the potential for saturation of the fill comprising the fill slopes, it is recommended that backdrains be provided at vertical intervals that do not exceed 15 feet. The lowest drain should be placed in the keyway or just above the keyway (wherever flow by gravity to daylight can be first obtained). The drains should consist of 4-inch diameter perforated pipes (perforations placed downward) surrounded by 1 cubic foot per lineal foot of 0.75 to 1.5-inch rock wrapped in geotextile filter fabric. The drains at different elevations may be connected together in the subsurface by solid pipes, or may be drained to the slope face independently. All exit (solid) pipes should flow at a 1% minimum gradient to daylight on the slope faces.

Potential surficial stability issues would result if existing fill soils were reworked without enhancement during remedial fill slope construction. As a result, remedial fill slopes should be reinforced with Triaxial BX-1200 (or equivalent) geogrids on 1.5-foot vertical spacings with 9.8-foot (i.e. 3 meter) embedment depths. (Equivalency would need to be evaluated by the geotechnical engineer once properties of proposed alternative geogrids are available.) The edges of the geogrids should be aligned to be either at the slope face, or one foot from the finished slope face to accommodate additional geotextiles intended to help reduce the effects of burrowing rodents, as discussed below.

Fill slopes should be overfilled, compacted, and then cut back to one foot below planned configurations. As an alternative to overfilling and trimming, slope faces can be rolled with a sheepsfoot and trackwalked if this procedure is used every 3 feet of

vertical elevation gain during construction of the slope (not simply after the entire slope is constructed).

In addition to a more aggressive extermination program for burrowing animals, a burrowing animal-resistant geotextile should be considered as a supplemental measure. Major geogrid manufacturers were questioned regarding whether testing is performed on geogrids to determine resistance to burrowing, and they indicated that they are not. However, a geogrid such as Tensar TX-5, with small diameter openings and extruded polypropylene manufacturing processes, would be expected to reduce the possibility of successful burrowing by animals. The geogrid would be placed on the compacted fill comprising the slope at a depth of about one foot below the finished slope face elevation. Additional soil should be moisture conditioned and placed over the burrowing animal-resistant geogrid with care taken to prevent damaging the geogrid. Compaction by track-walking should be adequate.

Finished slopes should be planted with a drought-resistant assemblage of plants intended to enhance stability, as directed by a landscape architect. The intent would be to provide temporary irrigation until plant growth is initiated, then remove the irrigation system when appropriate.

Previously paved areas should either be adjusted to provide positive drainage to the existing catch basin, or additional catch basins should be installed to carry water effectively away from the facility. If new drainage features are installed, discharge areas should include velocity reducers due to the erodible nature of on-site soils.

The previously paved areas should be covered with a geotextile liner to prevent water from migrating down into the underlying soils prior to replacing pavement, as recommended above for short-term solutions.

In either case (i.e. short-term or long-term solution), it is recommended that Earth Systems Southern California be retained to provide Geotechnical Engineering services during site development and grading, and foundation construction phases of the work to observe compliance with the design concepts, specifications and recommendations, and to allow design changes in the event that subsurface conditions differ from those anticipated prior to the start of construction.

ADDITIONAL SERVICES

This report is based on the assumption that an adequate program of monitoring and testing will be performed by Earth Systems Southern California during construction to check compliance with the recommendations given in this report. The recommended tests and observations include, but are not necessarily limited to the following:

Review of remedial grading plans during the design phase of the project.

Observation and testing during site preparation, remedial grading, and placing of engineered fill. Compaction tests shall be made to determine the relative compaction of the fills in accordance with the following minimum guidelines: one test for each two-foot vertical lift; one test for each 1,000 cubic yards of material placed; one test at the final fill slope face for each four-foot of slope height; and one test for each 300 feet of length in areas to be repaved.

Consultation as required during construction.

LIMITATIONS AND UNIFORMITY OF CONDITIONS

The analysis and recommendations submitted in this report are based in part upon the data obtained from the ground penetrating radar, the exploratory borings, and the test pits excavated on the site. The nature and extent of variations between and beyond the borings and test pits may not become evident until construction. If variations then appear evident, it will be necessary to reevaluate the recommendations of this report.

The scope of services did not include any environmental assessment or investigation for the presence or absence of wetlands, hazardous or toxic materials in the soil, surface water, groundwater or air, on, below, or around this site. Any statements in this report or on the soil boring logs regarding odors noted, unusual or suspicious items or conditions observed, are strictly for the information of the client.

Findings of this report are valid as of this date; however, changes in conditions of a property can occur with passage of time whether due to natural processes or works of

man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur whether they result from legislation or broadening of knowledge. Accordingly, findings of this report may be invalidated wholly or partially by changes outside the control of this firm. Therefore, this report is subject to review and should not be relied upon after a period of one year.

This report is issued with the understanding that it is the responsibility of the Owner, or of his representative to insure that the information and recommendations contained herein are called to the attention of the Engineers for the project and incorporated into the plan, and that the necessary steps are taken to see that the Contractor and Subcontractors carry out such recommendations in the field.

As the Geotechnical Engineers for this project, Earth Systems Southern California has striven to provide services in accordance with generally accepted geotechnical engineering practices in this community at this time. No warranty or guarantee is expressed or implied. This report was prepared for the exclusive use of the Client for the purposes stated in this document for the referenced project only. No third party may use or rely on this report without express written authorization from Earth Systems Southern California for such use or reliance.

It is recommended that Earth Systems Southern California be provided the opportunity for a general review of remedial designs and specifications in order that earthwork recommendations may be properly interpreted and implemented in the design and specifications. If Earth Systems Southern California is not accorded the privilege of making this recommended review, it can assume no responsibility for misinterpretation of the recommendations.

FIELD STUDY

A. A Ground Penetrating Radar survey was conducted by GeoSite Locators in the paved areas immediately surrounding the reservoir. The survey was conducted on August 6, 2013, using a Geophysical Survey Systems SIR 3000 Utility Scan System, wherein a dielectric signal is sent into the ground, and hyperbola signatures are generated where low or high density materials are encountered in the subsurface. The results of the survey are presented in Appendix D of this report.

B. Seven hollow-stem auger borings were drilled to a maximum depth of 31.5 feet below the existing ground surface to observe the soil profile and to obtain samples for laboratory analysis. Three of the borings (Nos. B-1 through B-3) were drilled on August 12, 2013, using a CME-75 track-mounted drill rig. The other four borings (Nos. B-4 through B-7) were drilled on August 14, 2013, using a truck mounted CME-75 drilling rig. (The approximate locations of the test borings were determined in the field by pacing and sighting, and by using a Garmin 706S GPS unit, and are shown on the Site Plan/Geologic Map in this Appendix.) The borings were backfilled with a slurried mixture of cuttings and concrete.

C. Three bucket auger borings (Nos. BA-1 through BA-3) were drilled to a maximum depth of 50 feet below the existing ground surface to observe the soil profile and subsurface geology, and to obtain samples for laboratory analysis. The borings were drilled between August 12 and 14, 2013, using SoilMec and LoDrill track mounted drilling rigs. The borings were downhole logged by an Engineering Geologist. (The approximate locations of the test borings were determined in the field by pacing and sighting, and are shown on the Site Plan/Geologic Map in this Appendix.) The borings were backfilled with cuttings that were tamped into place at regular vertical intervals of about 2 feet.

D. Four exploratory backhoe test pits were excavated to a maximum depth of 10 feet below the existing ground surface to observe the soil profile, subsurface geology, and geotechnical conditions. The test pits were excavated on August 12, 2013, and were logged by an Engineering Geologist. (The approximate locations of the test pits were determined in the field by pacing and sighting, and are shown on the Site Plan/Geologic Map in this Appendix.) The borings were backfilled with cuttings that were tamped into place at regular vertical intervals of about 2 feet.

E. Samples were obtained within the hollow-stem and bucket auger borings with a Modified California (M.C.) ring sampler (ASTM D 3550 with shoe similar to ASTM D 1586), and with a Standard Penetration Test (SPT) sampler (ASTM D 1586). The M.C. sampler has a 3-inch outside diameter, and a 2.42-inch inside diameter when used with brass ring liners (as it was during this study). The SPT sampler has a 2.00-inch outside diameter and a 1.37-inch inside diameter, but when used without liners, as was

done for this project, the inside diameter is 1.63 inches. The samples were obtained from the hollow-stem borings by driving the sampler with a 140-pound automatic trip hammer dropping 30 inches in accordance with ASTM D 1586. Samples were obtained from within the bucket auger borings by driving the sampler with the Kelly bar of the drill rig dropping approximately 12 inches. The hammer was operated with a hydraulically powered reversing winch.

F. Bulk samples of the soils encountered were gathered from the cuttings of selected hollow-stem auger borings.

G. The final logs of the borings and test pits represent interpretations of the contents of the field logs and the results of laboratory testing performed on the samples obtained during the subsurface study. The final logs are included in this Appendix.

SYMBOLS COMMONLY USED ON BORING LOGS

Modified California Split Barrel Sampler

Modified California Split Barrel Sampler - No Recovery

Standard Penetration Test (SPT) Sampler

Standard Penetration Test (SPT) Sampler - No Recovery

Perched Water Level

Water Level First Encountered

Water Level After Drilling

Pocket Penetrometer (tsf)

Vane Shear (ksf)

1. The location of borings were approximately determined by pacing and/or siting from visible features. Elevations of borings are approximately determined by interpolating between plan contours. The location and elevation of the borings should be considered

2. The stratification lines represent the approximate boundary between soil types and the transition may be gradual.

3. Water level readings have been made in the drill holes at times and under conditions stated on the boring logs. This data has been reviewed and interpretations made in the text of this report. However, it must be noted that fluctuations in the level of the groundwater may occur due to variations in rainfall, tides, temperature, and other factors at the time measurements were made.

APPENDIX B

Laboratory Testing
Tabulated Laboratory Test Results
Individual Laboratory Test Results
Scatter Diagrams of Direct Shear Data
Table 1809.7(1) (Expansion Ranges Table)

LABORATORY TESTING

A. Samples were reviewed along with field logs to determine which would be analyzed further. Those chosen for laboratory analysis were considered representative of soils that would potentially be exposed and/or used during grading, and those deemed to be within the influence of the reservoir and related structures. Test results are presented in graphic and tabular form in this Appendix.

B. In-situ Moisture Content and Unit Dry Weight for the ring samples were determined in general accordance with ASTM D 2937.

C. The relative strength characteristics of soils were determined from the results of Direct Shear tests on remolded samples. Specimens were placed in contact with water at least 24 hours before testing. Relatively undisturbed samples were sheared under normal loads ranging from 1 to 3 ksf in general accordance with ASTM D 3080. Remolded samples were sheared under normal loads ranging from 0.25 to 3 ksf.

D. Settlement characteristics were developed from the results of a one dimensional consolidation test performed in general accordance with ASTM D 2435. The sample was loaded to 0.125 ksf, flooded with water, and then incrementally loaded to 0.25, 0.5, 1.0, 2.0, 4.0, 8.0, and 16.0 ksf. The sample was allowed to consolidate under each load increment. Rebound was measured under reverse alternate loading. Compression was measured by dial gauges accurate to 0.0001 inch. Results of the consolidation test are presented in this Appendix as a percent consolidation versus log of pressure curve.

E. Expansion index tests were performed on bulk soil samples in accordance with ASTM D 4829. The samples were surcharged under 144 pounds per square foot at moisture content of near 50 percent saturation. Samples were then submerged in water for 24 hours and the amount of expansion was recorded with a dial indicator.

F. Maximum density tests were performed to estimate the moisture-density relationship of typical soil materials. The tests were performed in accordance with ASTM D 1557.

G. The gradation characteristics of selected samples were evaluated by hydrometer (in accordance with ASTM D 422) and sieve analysis procedures. Selected samples were soaked in water until individual soil particles were separated, then washed on the No. 200 mesh sieve, oven dried, weighed to calculate the percent passing the No. 200 sieve, and mechanically sieved. Additionally, hydrometer analyses were performed to assess the distribution of the minus No. 200 mesh material of the samples. The hydrometer portions of the tests were run using sodium hexametaphosphate as a dispersing agent.

H. Resistance ("R") Value tests were conducted on bulk samples secured during the field study. The tests were performed in accordance with California Method 301. Three specimens at different moisture contents were tested for each sample, and the R-Value at 300 psi exudation pressure was determined from the plotted results.

LABORATORY TESTING (Continued)

I. Portions of the bulk samples were sent to another laboratory for analyses of soil pH, resistivity, chloride contents, and sulfate contents. Soluble chloride and sulfate contents were determined on a dry weight basis. Resistivity testing was performed in accordance with California Test Method 424, wherein the ratio of soil to water was 1:3.

J. The Plasticity Indices of selected samples were evaluated in accordance with ASTM D 4318.

INTRODUCTION

Geo Site Locators has been contracted by Earths Systems Pacific in Ventura, CA to use Ground Penetrating Radar to survey the top asphalt and surrounding dam the Trace Reservoir locate existing voids within the dam due to deterioration from water at that site. Geophysical methodology and equipment used, analyses and findings are described in the following paragraphs.

GEOPHYSICAL METHODOLOGY AND EQUIPMENT

Geophysical Survey Systems SIR 3000 Utility Scan Ground Penetrating Radar (GPR) System with 270 MHz antenna was used to survey the site area. GPR survey scan sends a dielectric signal into the ground. This signal registers with the density of the soil which establishes the rate of penetration. Any other material or lack thereof of varied density will either speed up the signal or slow it down leaving either a hyperbola signature or show extreme black and white signatures within the gray spectum. The hyperbola signatures in this survey represent the location of the utility lines or other anomaly and extreme variations in the gray spectrum represent voids in the site. The GPR equipment can register most materials such as concrete, PVC, steel, electrical currents, air voids, moisture, water tables and variations in ground composition.

SITE AREA

For the purpose of the geophysical survey using GPR, the Site has been sectioned off into stationing marked at 50’ intervals. All anomalies found are referenced from these station locations. Lateral scans were taken at 10’ intervals

ANALYSES / INTERPRETATIONS AND FINDINGS

The images and photos associated with geophysical survey results are presented in the following pages. The results of findings from geophysical survey interpretations are based on GPR scans confirming presence of something other than compacted soil.

Care has been taken to eliminate from this survey those hyperbola shaped figures that were questionable as to their origin and show no consistency in signature on the GPR monitor. Low frenquency radio waves had some effect on the GPR equipment however during the survey, the ground conditions varied but allowed for our equipment to penetrate up to 5’ to 10’. The steepness of the grade made scanning on the side of the dam presented difficulties leaving this data questionable in some areas.
The following figures of scans and correlating photos explain the findings. The asphalt portion of the dam survey was performed on 8-06-13

Table of contents

Location	Station Location	Figure	Photo	Page
1	1+50	1	1	4
2	1+74	2	2	5
3	1+75-1+80	3	3	6
4	1+94	4	4	7

“	“		12&13	15
“	“	11	14	16
	1+00 &3+00	12 &13		17
	4+50 & 5+50	14 & 15		18
	7+50 & 8+50	16 & 17		19
	9+50 & 11+00	18 & 19		20
	12+00 & 13+00	20 & 21		21

Finding	Station Location	Depth	Type
1	1+50	4'+	Void

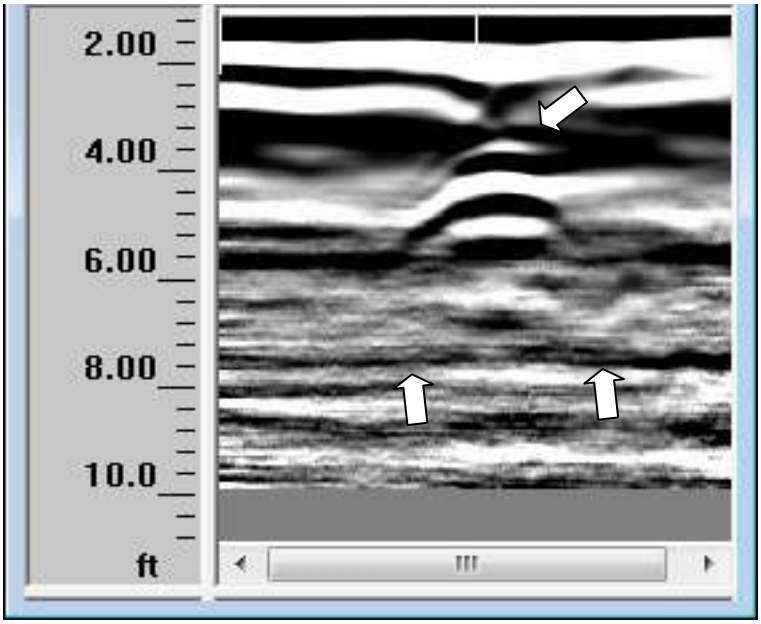

Figure 1

Photo 1

The scan in Figure 1 shows a variation in the soil around the dam. Low frequency interference canused the static from 5' down on the monitor as shown in Figure 1. However void areas can still be identified below 5'.

Finding	Station Location	Depth	Type
2	1+74	3’	Pipe

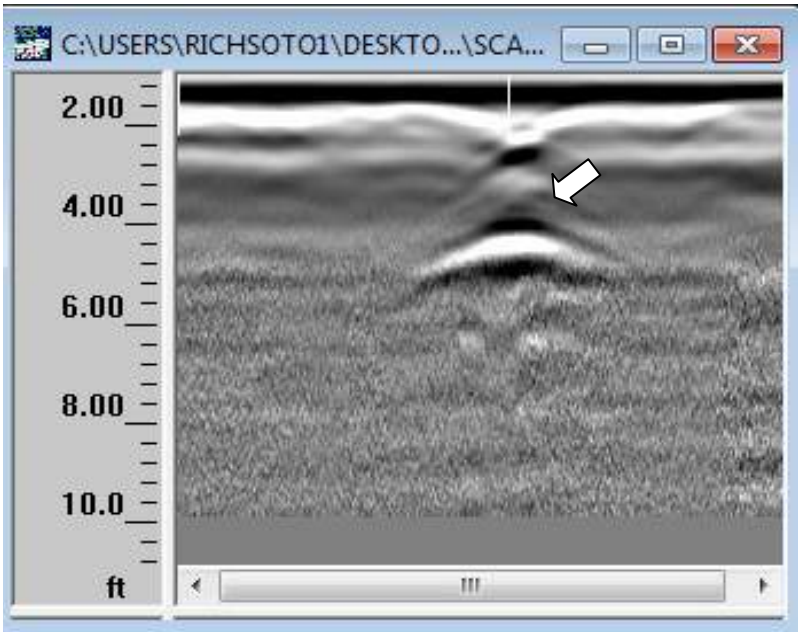

Figure 2

Photo 2

Finding	Station Location	Depth	Type
3	1+75-1+80	Surface +	Void

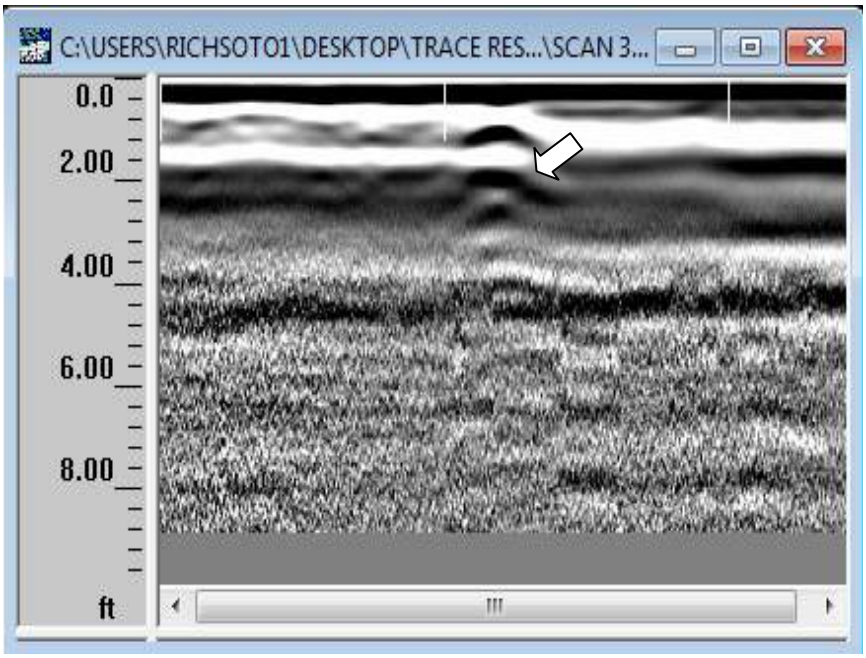

Figure 3

Photo 3

Arrows point to depresion in the asphalt where void area is.

Finding	Station Location	Depth	Type
4	1+94	3”	Electrical

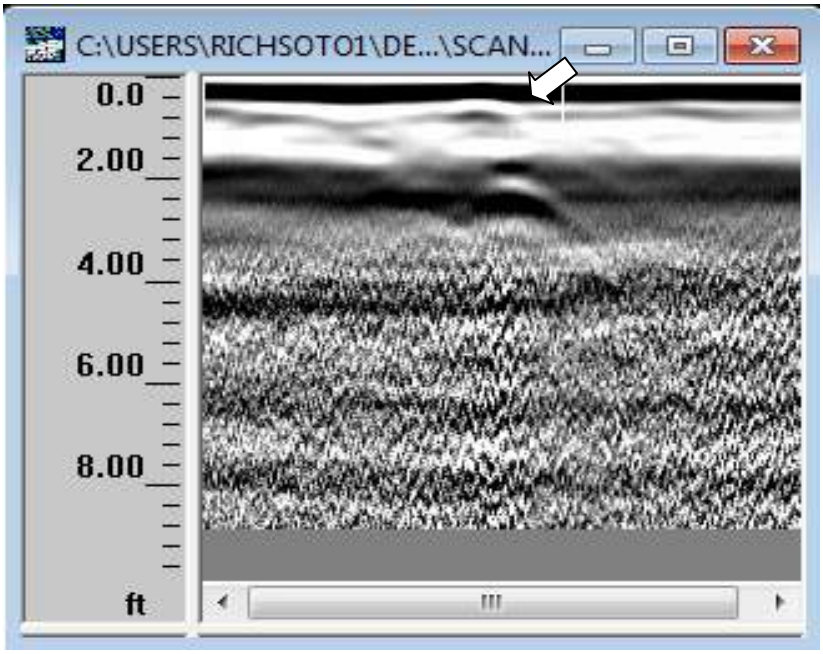

Figure 4

Photo 4

Finding	Station Location	Depth	Type
5	1+95	3’	Unknown

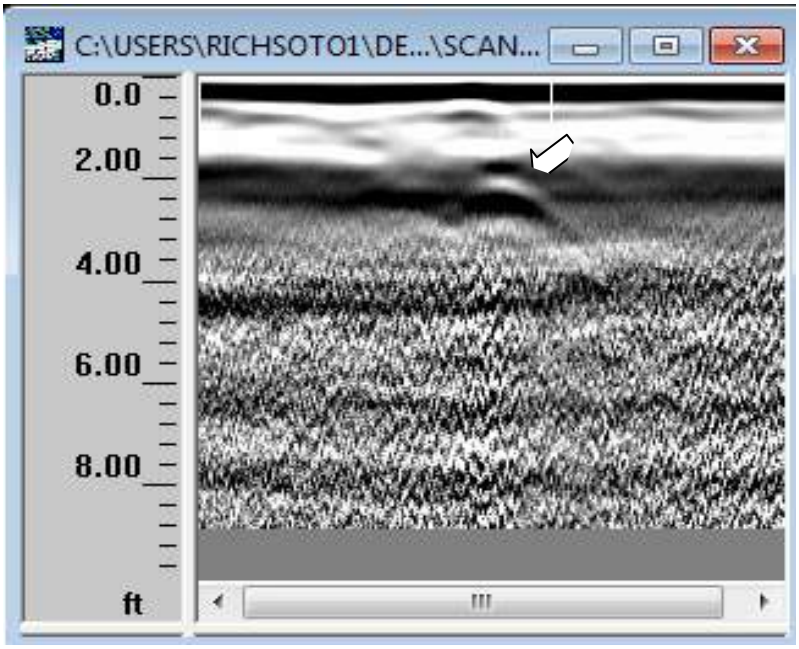

Figure 5

Photo 5

Finding	Station Location	Depth	Type
6	2+02-2+17	’	Area of Concern

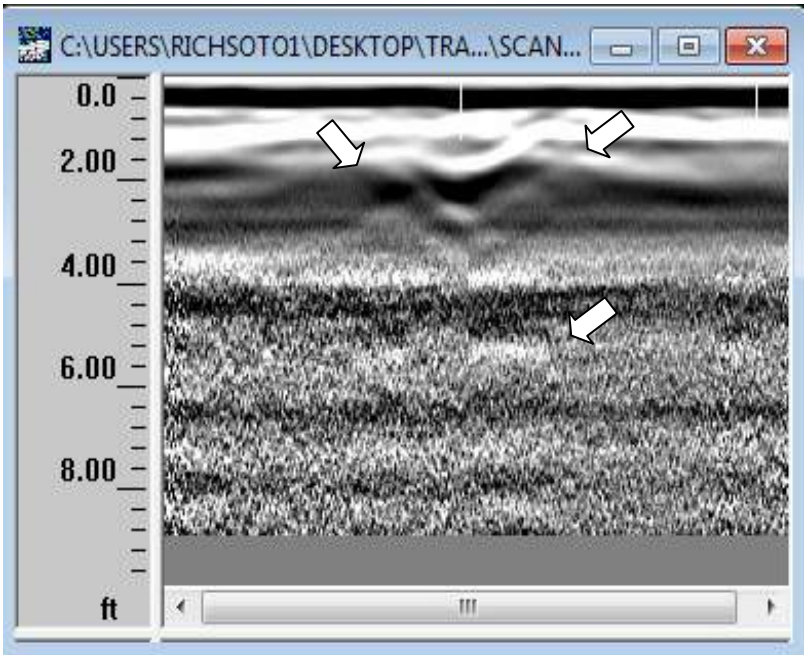

Figure 6

Photo 6

The scan in Figure 6 shows an area between the arrows having a variation in the soil from surrounding area. This may be a future trouble location.

Finding	Station Location	Depth	Type
7	2+56-2+66	4.5’	Area of Concern

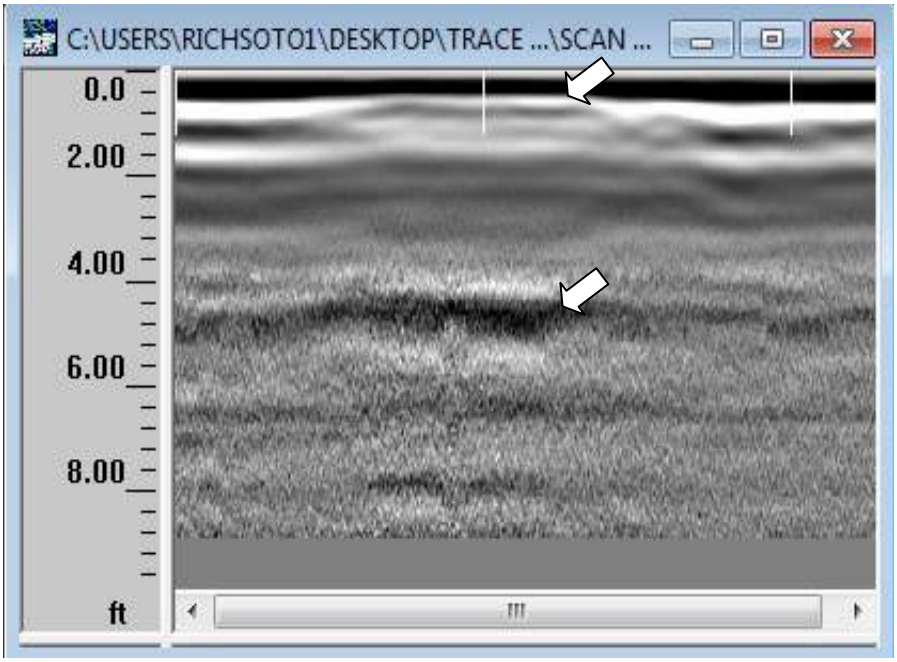

Figure 7

Photo 7

Scan in Figure 7 along the surface (top) shows an alteration from the soil just below the asphalt. Simularly there is an area at 4” that may be a void. Photo 8 may show why this condition exists.

Photo 8

Adjacent to Location 7, the rain drainage system has a large opening where water is entering the soil below.

Finding	Station Location	Depth	Type
8	3+61-3+82	3’	Area of Concern

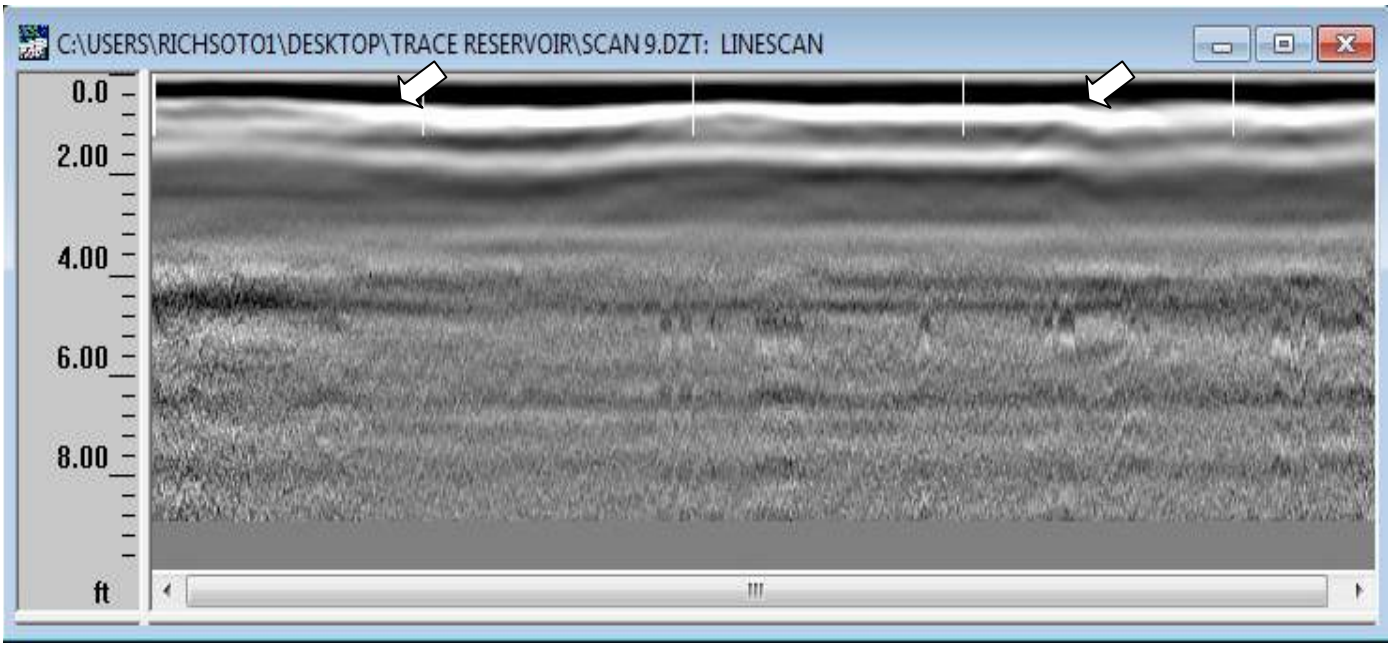

Figure 8

Photo 9

While not a problem area yet. It is clear that water is sitting in this area for long periods of time and beginning to erode under the asphalt as shown in Figure 8.

The following scans and photos are of the large sink holes in the southeast side of the reservoir.

Finding	Station Location	Depth	Type
9	6+36-6+69	2.5’	Large Sink Hole

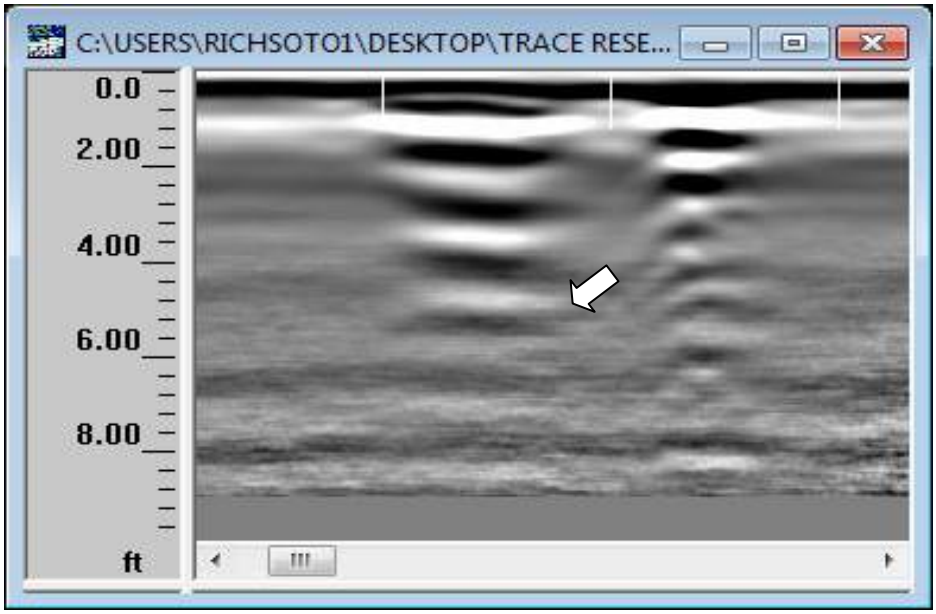

Figure 9

Photo 10

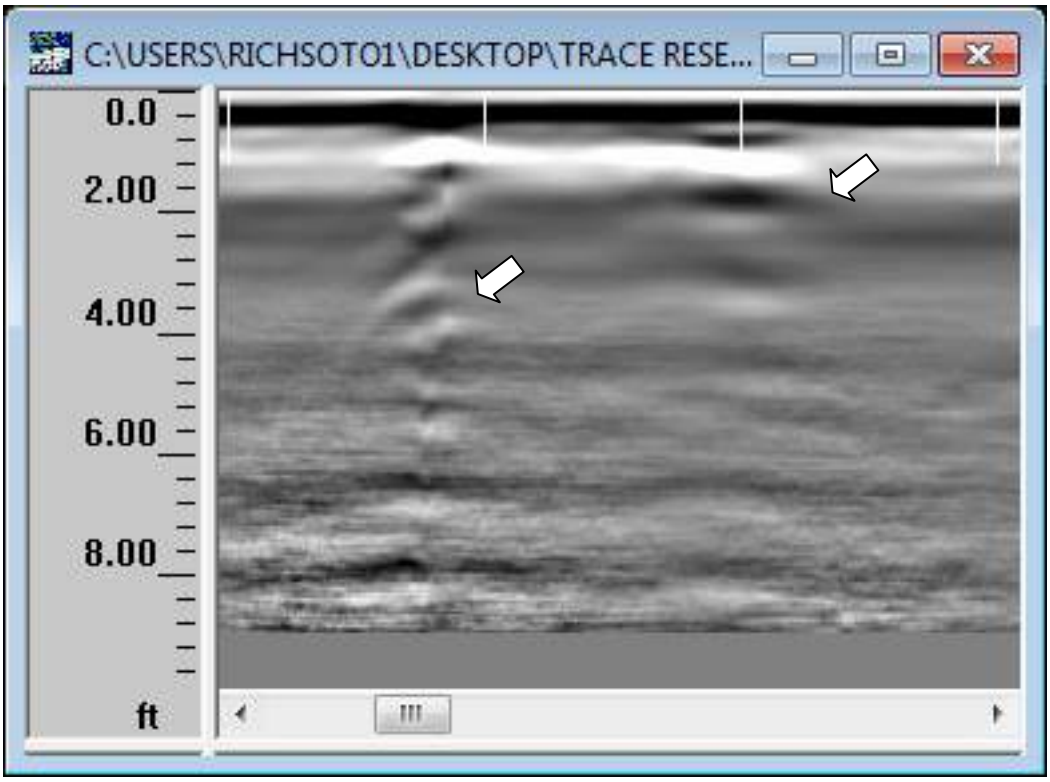

Figure 10

Photo 11

Left arrow in Photo 11 is represented by the right arrow in Figure 10. Photo 12 shows the void under the drain system.

Photo 12

Photo 13

Photo 13 shows a 1”+ off set at the bottom of the drainage system. The void in Photo 12 originates appears to this location.

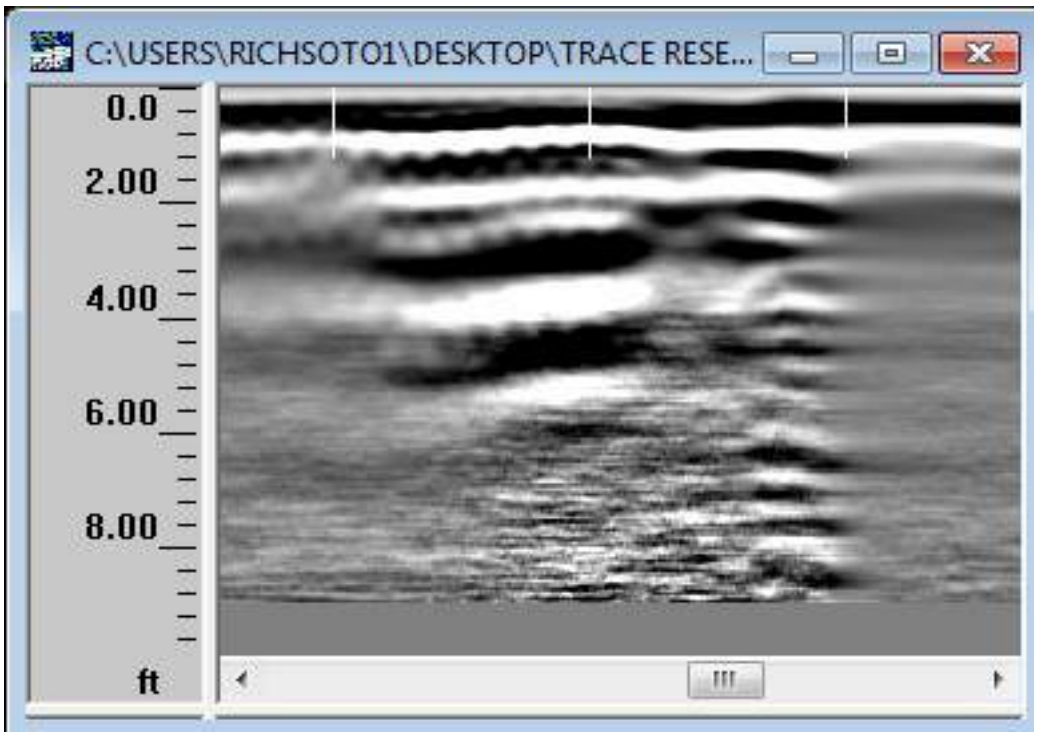

Figure 11

Photo 14

The following locations are of three scans per side of the reservoir where there appears to be no damage. No photos accompany these scans. What is of interest in these scans is the consistency of the soil as represented in the scans.

Subject: Data Summary Submittal - Environmental Site Investigation for the Vic Trace Reservoir Replacement Project, 740 Dolores Drive, Santa Barbara, California 93109

Dear Mr. Rejzek:

Rincon Consultants, Inc. (Rincon), on behalf of the City of Santa Barbara (City), has prepared this Data Summary Submittal for the Environmental Site Investigation for the Vic Trace Reservoir Replacement Project (project), located at 740 Dolores Drive, Santa Barbara, California (site; Figure 1). The purpose of the data summary is to report the results of the shallow soil assessment performed along the perimeter of the reservoir and associated valve building, and hazardous building materials survey conducted prior to demolition activities.

Background

Rincon prepared and submitted the Environmental Site Investigation Work Plan for the Vic Trace Reservoir Replacement Project (Rincon 2023, Work Plan) to the Santa Barbara County Health Department, Environmental Health Services (EHS) on July 26, 2023. As referenced in the Work Plan, the schedule for the subsurface soil investigation associated with the presence or absence of the historic oil well drilling sump will likely be conducted following the demolition phase of the reservoir and will be dependent on access and subcontractor availability. The field work associated with the shallow soil sampling and hazardous materials building survey has been completed and is summarized below.

Regulatory Setting and Screening Levels

Environmental Screening Levels (ESLs) have been established by the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) for chemicals commonly found in soil where releases of hazardous chemicals may have occurred (SFBRWQCB 2019). The ESLs are considered to be health-conservative concentration thresholds designed to be protective of the environment and human health. The SFBRWQCB's ESLs are used by all of the Regional Water Boards in the state of California, including the Central Coast.

Because the project will replace the existing 10-million-gallon drinking water storage tank with possibly two 5-million-gallon buried concrete tanks and site use will not change, the soil results will be compared to the Tier 1 ESL, Construction Worker ESL, and Commercial/Industrial ESL for lead. Additionally, because metals can be naturally occurring at elevated concentrations in the environment, metals are compared to regional Background Levels when Background Levels exceed risk-based

screening levels. A commonly used reference that lists estimates of naturally occurring concentrations of metals in California soil is a Kearney Foundation of Soil Science special report (Kearney 1996).

Shallow Soil Sampling

On October 16, 2023, Rincon collected a total of 25 shallow soil samples from a depth of approximately 0.5 feet below ground surface (bgs) using multiple stainless-steel trowels. Each trowel was decontaminated with an Alconox solution spray and rinsed with distilled water. The small amount of decontamination water was collected in a 5-gallon bucket and had evaporated by the end of field activities. Shallow soil locations SS-1 through SS-22 were located along the perimeter of the Vic Trace Reservoir and SS-23 through SS-25 were located along the perimeter of the valve building (Figure 2).

No soil discoloration or odors were observed during field activities. The majority of the shallow soil observed at the site was clayey sand with gravel. Boring logs from this investigation are provided in Attachment 1.

The soil samples were placed directly into laboratory-supplied containers, labeled, stored in a cooler with ice, and transferred to a courier using chain-of-custody protocol for delivery to Eurofins Calscience, in Tustin, California.

Laboratory Analysis

The shallow soil samples were analyzed for total lead using United States Environmental Protection Agency (USEPA) Method 6010B.

Results

The laboratory analytical results are summarized in Table 1 and the laboratory analytical report is provided in Attachment 2.

Lead was detected at concentrations ranging from 5.01 to 19.4 milligrams per kilogram (mg/kg). None of the detected lead concentrations in shallow soil collected at 0.5 feet bgs surrounding the Vic Trace Reservoir or the valve building exceeded the Tier 1 ESL of 32 mg/kg, Construction Worker ESL of 160 mg/kg, or the Commercial/Industrial ESL of 320 mg/kg. Additionally, all detected lead concentrations are either below or within the Background Level concentration range of 12.4 to 97.1 mg/kg.

Hazardous Building Materials Survey

FCG Environmental (FCG) was subcontracted to perform the hazardous building materials survey of the reservoir and valve building. The Asbestos and Lead Report prepared by FCG is provided in Attachment 3.

The following services were conducted to define potential asbestos and lead concerns at the site by FCG:

- A visual inspection of representative building materials was conducted to identify suspect asbestos and lead paint or other lead materials;
- The asbestos containing building materials (ACM) surveys were conducted by a California Division of Occupation Safety and Health Certified Asbestos Consultant/Site Surveillance Technician and the lead-based paint (LBP) surveys were conducted by a State of California Department of Public Health Services Certified Lead Inspector/Risk Assessor for LBP;
- A total of 23 bulk samples were collected from representative suspect ACMs for submittal to a qualified laboratory for asbestos analysis;

- Screening for lead-based paint was conducted using an X-Ray Fluorescence (XRF) paint analyzer to screen representative surfaces and materials suspected of being coated with lead-based paint. Three bulk samples were analyzed by polarized light microscopy (PLM), to determine asbestos fiber concentrations in bulk building material samples. PLM is applicable for the analysis of building survey submissions and other bulk materials; and
- Three bulk samples were collected from the corrugated metal roofing which appeared to be covered by a light powder coating or sealant. No other painted materials were found on the main reservoir.

Laboratory Analysis

The ACM bulk samples were collected from representative suspect materials and sent to SGS Forensic Analytical for analysis by Polarized Light Microscopy (PLM) using EPA Method 600/R- 93-116, Visual Area Estimation.

The lead bulk samples were analyzed for Total Lead by SGS Forensic Analytical, a state-certified laboratory using EPA Method 3050B/7000B using flame atomic absorption and mass spectrophotometry.

Results

Asbestos

Based on laboratory analytical results and visual observations, asbestos was not detected above the detection limit in any of the suspect building materials sampled as part of FCG's survey. Based on these findings, no ACMs were identified at the site.

Lead

The concrete and wood framing were unpainted, and the corrugated aluminum roofing and siding contained only minor concentrations of lead (12-30 parts per million). All lead findings were well below any regulated levels. Therefore, no LBP or lead concerns were identified as part of FCG's survey.

Conclusions and Recommendations

The results of the shallow soil assessment performed at the site indicate no elevated concentrations of lead are present along the perimeters of the reservoir or valve building. No mitigation measures, or special handling or management for lead impacted shallow soils is required along the perimeters of the reservoir or valve building.

The results of the hazardous building materials survey conducted for the reservoir and valve building indicate that no special handling is required for future demolition of the site building materials that were tested. Materials tested as a part of this survey may be disposed of as regular construction waste.

Surveying of the valve building structure was limited to the roofing and exterior concrete. The interior of this building was not assessed due to lack of access. Additional sampling or inspection of the valve building interior may be required should this structure be demolished or renovated.

The hazardous building materials survey was limited to readily accessible areas. There is potential that suspect materials previously not included or identified by FCG's survey could be discovered during site work. This may include suspect materials located inside the parts of the reservoir underwater or not accessible during FCG's inspection. If suspect materials are found during site demolition or renovation

work, the area should be isolated, and any suspect materials tested to confirm or deny the presence of asbestos, lead, or other hazards.

Sincerely,
Rincon Consultants, Inc.

Laboratory Analytical Report

eurofins | Environment Testing

ANALYTICAL REPORT

PREPARED FOR

Attn: Zach Berghorst
Rincon Consultants
319 E Carillow St
Suite 105
Santa Barbara, California 93101

Generated 10/26/2023 3:23:01 PM

JOB DESCRIPTION

Vic Trace / 22-12664

JOB NUMBER

570-157066-1

Eurofins Calscience
2841 Dow Avenue, Suite 100
Tustin CA 92780

See page two for job notes and contact information.

my EOL

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Calscience Project Manager.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Case Narrative

Client: Rincon Consultants
Project/Site: Vic Trace / 22-12664

Job ID: 570-157066-1

Job ID: 570-157066-1

Laboratory: Eurofins Calscience

Narrative

Job Narrative
570-157066-1

Receipt
The samples were received on 10/17/2023 5:05 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 4.6º C.

Metals
Method 6010B: The serial dilution performed for the following sample associated with batch 570-376952 was outside control limits for Lead: (570-157334-B-3-A SD ^25)

Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-375607 and analytical batch 570-376952 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Detection Summary

Client: Rincon Consultants

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

Subject: **Asbestos & Lead Survey Report**
Vic Trace Reservoir – City of Santa Barbara
La Coronilla Drive, Santa Barbara, CA
FCG Project Code: Rincon Consultants–37

Dear Ms. Allman:

FCG Environmental (FCG) conducted a hazardous materials survey of the Vic Trace Reservoir, which included asbestos and lead bulk sampling. The investigation was performed on October 16, 2023, by Alan Forbess, CA Certified Asbestos Consultant (No. 94-1549) and CA Lead Inspector/Assessor and Project Monitor (No. 505/504). This report documents the results of our survey, which was conducted to identify proper handling of building materials prior to demolition or renovations to the existing reservoir.

1.0 Background Information / Scope of Project

Background/Site Description: According to information provided to FCG, the reservoir is a concrete structure roughly 382 feet long by 250 feet wide covered by a wood-framed aluminum roofing and siding. The reservoir is in-ground with upper walls and roofing above grade. A central ridge vent runs east-to-west across the length of the reservoir. The surfaces around the reservoir are paved with asphalt and concrete with concrete drainage swales to direct runoff away from the reservoir. Newer concrete paving was noted in the SW corner of the site, with fencing running along the perimeter on all sides. A valve building is located to the north of the reservoir near the main entrance on La Coronilla Drive. Limited testing was conducted from the valve building exterior only, as the building was locked and inaccessible. Please see the attached photos for additional information.

Scope of Project: FCG was asked to perform a survey of building materials to identify hazardous materials concerns in accordance with federal, state and local regulations. The following services were conducted to define asbestos and lead concerns at the subject site:

- A visual inspection of representative building materials was conducted to identify suspect asbestos and lead paint or other lead materials. Digital photographs were taken, and selected photos are attached for review.
- Bulk samples were collected from representative suspect materials for submittal to a qualified laboratory for asbestos analysis. All bulk samples were analyzed by SGS Forensic Analytical, a state-certified laboratory located in Carson, CA. All samples were

analyzed by polarized light microscopy (PLM), to determine asbestos fiber concentrations in bulk building material samples. PLM is applicable for the analysis of building survey submissions and other bulk materials.
- Screening for lead-based paint was conducted using an X-Ray Fluorescence (XRF) paint analyzer to screen representative surfaces and materials suspected of being coated with lead-based paint.
- All field observations, laboratory analytical data, XRF readings and other findings have been evaluated, with this written report summarizing our findings and providing recommendations as necessary.

2.0 Asbestos Survey Findings

Suspect Materials: After a visual inspection at the subject site was completed, the following suspect asbestos containing materials were noted:

- Caulking mastics inside hatches
- Caulking on roof fasteners
- Rubber washers on metal fasteners (roof)
- Concrete walls – main reservoir
- Concrete drainage swales
- Caulking in drainage swale (concrete seams)
- Asphalt pavement/surfacing around reservoir (apron)
- Concrete pavement/surfacing (apron and curbs, etc.)
- Foam insulation on underside of ridge vent
- Rubber gaskets at ridge vent
- Metal roof coating (these samples are on a separate chain-of-custody)
- Valve Building roofing materials (felts, tars, aggregate, etc.)
- Valve Building concrete walls

Bulk Sampling Results: FCG collected a total of 23 bulk samples from suspected asbestos containing materials at the subject site. The samples were collected and forwarded to SGS Forensic Analytical, for analysis by Polarized Light Microscopy (PLM) using EPA Method 600/R-93-116, Visual Area Estimation.

Summary of Lab Results: Based on laboratory analytical results, all of the suspect building materials tested as part of our survey were found to be “Non-Detect” for asbestos. **Therefore, no asbestos containing materials (ACM) were identified during our survey.** Please refer to the Attachments for a complete copy of the laboratory analytical report and our bulk sampling log sheet.

3.0 Limited Lead Survey

FCG was contracted to perform field testing to determine the presence of lead-based paint or lead components at the subject site. A visual inspection was conducted to identify areas of suspect lead-based paint or coatings. All fieldwork was conducted by a CA Certified Lead Inspector/Assessor. The findings of this survey will be used by contracting personnel to determine appropriate lead safe work practices prior to future site work.

Background Information on Lead Paint Requirements: Several regulations apply to the disturbance and possible exposure to lead from paints and other coatings. Title 17 of the California Code of Regulations (CCR) applies to residences and buildings accessible to the public that were constructed prior to 1979, and schools constructed before 1993 where lead paint may exist. Cal-OSHA regulations found within Title 8 of the CCR apply to worker exposure as stated in the Lead-in-Construction Standard (8-CCR-1532.1). The EPA recently issued a final rule to address lead-based paint hazards created by renovation, repair and painting activities that disturb lead-based paint in target housing and child-occupied facilities.

The EPA's Lead Renovation, Repair and Painting (RRP) Program was passed into regulation requiring compliance with training and certification requirements per Title 40 of the Code of Federal Regulations (40 CFR Part 745). The RRP rule states that firms and individuals conducting renovations of target housing constructed before 1978 must assume that lead is present in all painted surfaces or coatings unless a written determination has been made by a Certified Inspector that the components affected by the renovation are free of paint or other surface coatings that contain lead equal to or in excess of 1.0 milligrams per square centimeter (mg/cm^2) or 0.5% by weight.

***Scope of Lead Testing Services*:** FCG's scope of services involved sampling through use of bulk sampling or "paint chip" methods. Paint chip sampling methods were utilized to remove the surface coating down to the substrate to determine the presence of lead-based paint in relevant surfaces. Samples were forwarded to SGS Forensic Analytical Laboratories for analysis by EPA Methods 3050B/7000B for Total Lead using atomic adsorption and an acid digestion process. Please see the attached laboratory analytical report for detailed information.

Bulk Sample Results: Three bulk samples were collected from the corrugated metal roofing which appeared to be covered by a light powder coating or sealant. No other painted materials were found on the main reservoir. Bulk sampling was conducted according to the specifications described in the protocols for Risk Assessments in the Housing and Urban Development (HUD) Guidelines Chapter 5 (revised 1997). The HUD "Guidelines" are the industry standard for lead mitigation and abatement tasks. Bulk lead samples were analyzed for Total Lead by SGS Forensic Analytical, a state-certified laboratory using EPA Method 3050B/7000B using flame atomic absorption and mass spectrophotometry. Please see the table below for a summary of paint chip sample results and the attached laboratory analytical data for additional information.

Table 1: Lead Paint Chip Sampling Results

Sample ID	Material	Location	Concentration of Lead in PPM (mg/kg)	Lead Based Paint / Hazardous Waste* (Total Lead in ppm)
Pb-1	Metal Roofing with Coating	Roof Cover - North	12	5,000 / 1,000
Pb-2	Metal Roofing with Coating	Roof Cover - West	22	5,000 / 1,000
Pb-3	Metal Roofing with Coating	Roof Cover - South	30	5,000 / 1,000
Regulatory definition of Lead-Based Paint (LBP) = 5,000 ppm or 0.5% by weight. Hazardous Waste definition for Total Lead = 1,000 ppm Please refer to the attached laboratory analytical report for additional information.				

Summary of Bulk Sample Results for Lead: All three of the collected bulk samples taken from the corrugated roofing and siding materials were found to be well below the state and federal definition of lead based paint (LBP) and hazardous waste criteria for Total Lead. No other painted materials were identified within the project scope. Please see the attached analytical data for a complete copy of the laboratory report and bulk sampling information.

4.0 Conclusions & Recommendations

An asbestos and lead survey of the subject site has been completed per the terms of our agreement to define hazardous materials issues prior to demolition or renovation activities. Based on our visual observations and our evaluation of analytical data, we conclude the following:

Asbestos:

- Based on laboratory analytical results and our visual observations, no asbestos was detected in any of the suspect building materials sampled as part of our survey. Based on these findings, no asbestos containing materials (ACM) were identified at the subject site.

Lead:

- No lead based paint or lead components were found at the subject site. The concrete and wood framing were unpainted, and the corrugated aluminum roofing and siding contained only minor concentrations of lead (12-30 ppm). All lead findings were well below any regulated levels. Therefore, no lead-based paint (LBP) or lead concerns were identified as part of our survey.

General Recommendations:

- Based on the absence of asbestos and lead within the reservoir structure, no special handling is required. Future site work may be conducted by regular construction personnel and the materials tested may be disposed of as regular construction waste.
- Our survey of the Valve Building structure was limited to roofing and exterior concrete only. We could not access the interior of the building. If this building will be demolished or renovated, additional sampling or inspection of the building interior should be conducted.
- As our survey was limited to readily accessible areas, there is potential that suspect materials previously not included or identified by our survey could be discovered during site work. This may include suspect materials located inside the parts of the reservoir underwater or not accessible during our inspection. If suspect materials are found during site demolition or renovation work, the area should be isolated, and any suspect materials tested to confirm or deny the presence of asbestos, lead or other hazards.

Limitations Statement

The data compiled and evaluated as part of this assessment was limited and may not represent all conditions at the subject site. Asbestos was widely used until the late 1970's in thousands of building materials (i.e., joint compound, wallboard, thermal system insulation (TSI), acoustical ceiling, roofing material, etc.), making it difficult to locate all areas of ACM usage. This assessment reflects the data collected from the specific locations tested to identify Asbestos Containing Materials (ACM) in those locations and may not be all encompassing. There is always potential for asbestos containing materials to be missed due to problems with accessibility, and the broad variety of uses. The presence or absence of lead-based paint or lead-based paint hazards applies only to the tested or assessed surfaces on the date of the field visit. It should be understood that conditions noted within this report were accurate at the time of the inspection and in no way reflect the conditions at the property after the date of the inspection. All data collection, findings, conclusions and recommendations presented by FCG within this report are based upon limited data using current standard practices accepted within the industry. The conclusions and recommendations presented within this report are based on current regulations and the professional experience of the certified professionals involved in this project.

The data collected during this assessment and any resulting recommendations shall be used only by the client for the site described in this report. Any use or reliance of this report by a third party, including any of its information or recommendations, without the explicit authorization of the client shall be strictly at the risk of the third party.

It should not be misconstrued that this assessment has identified any or all environmental conditions at the subject site. FCG makes no representations regarding the accuracy of the enclosed data and will not be held responsible for any incidental or consequential loss or punitive damages including but not limited to, loss of profits or revenues, loss of use of a facility or land, delay in construction or action of regulatory agencies.

If you have any questions or concerns regarding the information provided, please do not hesitate to call us at 805.646.1995.

NOTICE OF PREPARATION
of a Draft Environmental Impact Report for the City of Santa Barbara Vic Trace Reservoir Replacement Project

Date: November 13, 2025

To: State Clearinghouse, Responsible Agencies, Trustee Agencies, and Interested Parties

Project Title:

Vic Trace Reservoir Replacement Project, Project No. 41510

Project Location:

The Project site encompasses the Vic Trace Reservoir parcel and various water infrastructure improvements in the Alta Mesa neighborhood in the City of Santa Barbara (City), California.

The Vic Trace Reservoir parcel covers approximately 15 acres (14.726 acres) and is located on City-owned property at 740 Dolores Drive, Santa Barbara (Assessor's Parcel Number [APN] 035-033-031). The parcel contains existing drinking water infrastructure facilities, existing City communication facilities, and La Coronilla Park. Access to the Vic Trace Reservoir parcel is from La Coronilla Drive between residences at 1617 and 1633 La Coronilla Drive via an existing 20-foot-wide easement through the 1617 La Coronilla Drive property.

Underground water main pipeline (main) work is proposed within the public right-of-way (ROW) paved roadways near the Vic Trace Reservoir parcel, including La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road.

Notice Of Preparation Comment Period:

November 13, 2025, to December 18, 2025

Scoping Meeting:

On **December 3, 2025, from 5:30 p.m. to 7:00 p.m.,** the Scoping Meeting will be held at the Louise Lowry Davis Center located at 111 W Victoria Street, Santa Barbara, California 93101.

Lead Agency Contact:

Kelly Bourque, Senior Project Engineer
City of Santa Barbara, Public Works Department, Engineering Division
630 Garden Street, Santa Barbara, CA 93102
Email: VicTrace@SantaBarbaraCA.gov

Introduction:

The City is the Lead Agency under the California Environmental Quality Act (CEQA). After preparing an Initial Study, the City has determined that the Project may have a potential significant effect on Aesthetics, Air Quality, Biological Resources, Cultural and Tribal Cultural Resources, Geology and Soils, Greenhouse Gas Emissions, Hazards and Hazardous Materials, Noise, Transportation, and Utilities and Service Systems. An Environmental Impact Report (EIR) will be prepared to evaluate these potential effects.

This Notice of Preparation (NOP) from the City informs agencies and interested parties that an EIR will be prepared for the proposed Project. This NOP solicits guidance from regulatory agencies about the scope and content of the environmental information included in the EIR as related to the agencies' statutory responsibilities. The agencies will use the EIR when considering their respective permits or other approvals related to the Project. This NOP allows interested parties to inform the City regarding environmental issues that should be addressed in the EIR.

Project Description:

Originally constructed in 1956, Vic Trace Reservoir is one of the City's largest water storage reservoirs. It serves as a vital component of the City's water distribution system, serving nearly 60,000 people or approximately 70% of the City's population. In 2021, the City's Water Distribution Infrastructure Plan (WDIP) recommended replacement of Vic Trace Reservoir due to its age, increasing repair needs, and importance to the City's overall water storage portfolio.

The proposed Project includes the following main elements:

- **Vic Trace Reservoir Parcel Improvements:** Replacement of the existing 10 million gallon (MG) Vic Trace Reservoir with two 5 MG reservoirs at the same site, building and facilities replacements, earthwork, and site improvements on the parcel, including possible renewable energy generation and storage.
- Offsite Improvements:
    - **Underground Water Mains:** Replacements, repairs, abandonments, and relocations of aging water mains in neighborhood areas near the Vic Trace Reservoir parcel.
    - **Underground Pressure Regulating Valve (PRV) Station Relocation**: Relocation of the reservoir's downstream PRV station to an improved location with safer entry.

Construction of the proposed Project is expected to occur over approximately three years, anticipated to begin in July 2028 and end in August 2031.

The objectives of the proposed Project include the following:

- Replace and upgrade aging water infrastructure to ensure safe and reliable drinking water;

- Improve existing facilities and install new facilities to enhance the operational reliability and resiliency, minimize the risk of future facility failures, and optimize hydraulics and operations of Vic Trace Reservoir and the City's water system;
- Maintain critical demand capacity (e.g., peak demands, structure fires, human consumption) and system pressure city-wide;
- Address updated regulations that require more robust security for water infrastructure; and
- Maintain the City's ability to store a large amount of water locally, which is a key element of Santa Barbara's strategy to remain resilient and resistant to local emergencies or other climate change-related issues (e.g., drought, storms, wildfires).

The CEQA Initial Study for the Project is available for review on the City's website: https://santabarbaraca.gov/VicTrace

Probable Environmental Effects and Scope of the EIR:

In accordance with State CEQA Guidelines Section 15063(a), the City prepared the CEQA Initial Study**,** which found potentially significant impact(s) in several environmental issue areas. The City advises that an EIR would be necessary to evaluate the potentially significant environmental effects on the following environmental topics outlined in Appendix G of the *State CEQA Guidelines*:

- Aesthetics;
- Air Quality;
- Biological Resources;
- Cultural and Tribal Cultural Resources;
- Geology and Soils;
- Greenhouse Gas Emissions;
- Hazards and Hazardous Materials;
- Noise;
- Transportation; and
- Utilities and Service Systems.

NOP Comment Period:

In accordance with the time limits identified in State law (CEQA Guidelines 15082(b)), please respond to this NOP with your comments on the scope and content of the EIR as soon as possible, but **no later than 5:00 p.m. on December 18**, which is 35 days following the date this NOP was first posted and published. Please include the name of the contact person for your agency, if applicable, and submit written comments to:

Kelly Bourque, Senior Project Engineer
City of Santa Barbara, Public Works Department, Engineering Division
630 Garden Street, Santa Barbara, CA 93102

Subject: Notice of Preparation of a Draft Environmental Impact Report for the Vic Trace Reservoir Replacement Project, SCH No. 2025110233, Santa Barbara County, CA

Dear Kelly Bourque:

The California Department of Fish and Wildlife (CDFW) reviewed the Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) from City of Santa Barbara (City) for the Vic Trace Reservoir Replacement Project (Project) pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines[1].

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, CDFW appreciates the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code.

CDFW ROLE

CDFW is California's Trustee Agency for fish and wildlife resources and holds those resources in trust by statute for all the people of the State (Fish & G. Code, §§ 711.7, subd. (a) & 1802; Pub. Resources Code, § 21070; CEQA Guidelines § 15386, subd. (a)). CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (Fish & G. Code, § 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources.

CDFW may also act as a Responsible Agency under CEQA. (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381). CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code. As proposed, for

[1] CEQA is codified in the California Public Resources Code in section 21000 et seq. The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

Docusign Envelope ID: 6189D8AC-AD90-4ED4-A203-D05C1964E54D

example, the Project may be subject to CDFW's lake and streambed alteration regulatory authority (Fish & G. Code, § 1600 et seq.). Likewise, to the extent implementation of the Project as proposed may result in "take" as defined by State law[2] of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 et seq.) or the Native Plant Protection Act (NPPA; Fish & G. Code, §1900 et seq.), the Project proponent may seek related take authorization as provided by the Fish and Game Code.

PROJECT DESCRIPTION SUMMARY

Proponent: City

Objective: The objective of the Project is to replace the existing 10-million-gallon (MG) Vic Trace Reservoir with two 5 MG reservoirs, conduct building and facilities replacements, earthwork, and site improvements, which may include possible renewable energy generation and storage. Additionally, the Project proposes to conduct replacements, repairs, abandonments, and relocation of aging underground water mains in the neighborhood areas near the Vic Trace Reservoir parcel. Lastly, the Project includes relocation of the reservoir's downstream underground pressure regulating valve (PRV) station to an improved location with safer entry.

Location: The Project site is approximately 15 acres located at 740 Dolores Drive (Assessor's Parcel Number 035-033-031) in Santa Barbara County. The Project site contains existing drinking water infrastructure facilities, existing City communication facilities, and La Coronilla Park. Access to the Project site is from La Coronilla Drive between residences at 1617 and 1633 La Coronilla Drive via an existing 20-foot-wide easement through the 1617 La Coronilla Drive property. Lastly, the proposed Project includes the public right-of-way paved roadways near the site, including La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road.

Timeframe: Construction of the proposed Project is expected to begin in July 2028 and end in August 2031.

Biological Setting: The Project site is surrounded by residential development, and a stream runs horizontally to the Project site less than one mile north within Honda Valley Park. According to the Project's Initial Study/Environmental Checklist (IS), lemonade berry scrub (*Rhus integrifolia* shrubland alliance; State Rank 3) has been identified on site and 0.29 acres are proposed to be directly impacted from Project activities. The IS included negative results of special-status plant and wildlife species during a reconnaissance-level field survey. Additional specific details of the reconnaissance-level field survey were not included within the IS.

[2] "Take" is defined in Section 86 of the Fish and Game Code as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill."

Docusign Envelope ID: 6189D8AC-AD90-4ED4-A203-D05C1964E54D

Species that are of potential concern include, but are not limited to, lemonade berry scrub, Crotch's bumble bee (*Bombus crotchii*; CESA candidate endangered), monarch butterfly (*Danaus plexippus plexippus*; Endangered Species Act (ESA) candidate species), white-tailed kite (*Elanus leucurus*; CDFW Fully Protected), and nesting birds and raptors. The NOP does not propose mitigation measures in regard to biological resources.

COMMENTS AND RECOMMENDATIONS

CDFW offers the comments and recommendations below to assist the City in adequately identifying and/or mitigating the Project's significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources.

Specific Comments

1) Crotch's Bumble Bee. Crotch's bumble bee is a generalist bee species that can utilize a variety of habitats, such as shrublands and semi-urban settings for nesting and foraging opportunities. According to the California Natural Diversity Database (CNDDB; CDFW 2025a), Crotch's bumble bee has been observed within one mile of the Project site. Additionally, the Project site falls within the current range for Crotch's bumble bee based on CDFW's Crotch's Bumble Bee Range Dataset (CDFW 2024b). Focused surveys should be conducted to determine Crotch's bumble bee presence/absence within the Project site. Without a focused survey, Project activities could result in permanent loss of floral resources and nesting sites, nest abandonment, and/or direct injury or mortality of Crotch's bumble bee.

   In preparation of the DEIR, CDFW recommends the City retain a qualified biologist with the appropriate handling permits to conduct focused surveys. Focused surveys should follow CDFW's Survey Considerations for California Endangered Species Act Candidate Bumble Bee Species (CDFW 2023). Focused surveys should also be conducted throughout the entire Project site during the appropriate flying season to ensure no missed detection of Crotch's bumble bee occurs. Findings from the focused survey should be included in the DEIR for complete public disclosure and review.

   The DEIR should also provide a discussion of habitat suitability for Crotch's bumble bee. Additionally, the DEIR should provide a discussion of the Project's potential direct and indirect impacts on Crotch's bumble bee. If the Project would impact Crotch's bumble bee, the DEIR should provide measures to minimize, and/or mitigate potential impacts to Crotch's bumble bee as well as habitat supporting the species. Coordination with CDFW is recommended and may include obtaining appropriate take authorization under CESA.

   CDFW considers adverse impacts to a species protected by CESA to be significant. Take of any endangered, threatened, candidate species, or NPPA-listed plant species that results from the Project is prohibited, except as authorized by state law

Docusign Envelope ID: 6189D8AC-AD90-4ED4-A203-D05C1964E54D

(Fish & G. Code §§ 2080, 2085; Cal. Code Regs., tit. 14, §786.9). Consequently, if the Project or any Project-related activity will result in take of a species designated as endangered or threatened, or a candidate for listing under CESA, CDFW recommends that the Project proponent seek appropriate take authorization under CESA prior to implementing the Project. Appropriate authorization from CDFW may include an Incidental Take Permit (ITP) or a consistency determination in certain circumstances, among other options (Fish & G. Code, §§ 2080.1, 2081, subds. (b) and (c)). Early consultation is encouraged, as significant modification to a Project and mitigation measures may be required to obtain a CESA Permit.

To ensure CDFW will be able to use the City's CEQA document for the issuance of an ITP, the DEIR should address all Project impacts to CESA-listed species and specify a mitigation, monitoring, and reporting program that will meet the requirements of an ITP.

2) Lemonade Berry Scrub Mitigation. According to the NOP, mitigation for the adverse impacts to lemonade berry scrub habitat are not proposed. CDFW considers plant communities, alliances, and associations with a statewide ranking of S1, S2, S3 and S4 as sensitive and declining at the local and regional level (Sawyer et al. 2008). An S3 ranking indicates there are 21-80 occurrences of this community in existence in California, S2 has 6-20 occurrences, and S1 has less than 6 occurrences. The Project proposes to have direct effects to lemonade berry scrub which is considered sensitive at S3 statewide ranking; therefore, adverse impacts may be significant and should be compensated as such.

   If complete avoidance of any sensitive vegetation community is unattainable, the Project proponent shall provide compensatory mitigation to offset the Project's impact on the species observed on site at no less than 2:1. The total habitat acreage within the mitigation land shall be no less than 2:1. The Project proponent shall acquire CDFW approved mitigation land that has presence of the impacted special-status plant species and ensure they are located in the same watershed as the Project site. The mitigation land shall also provide equivalent or greater habitat value than that of the Project site. The Project proponent shall protect replacement habitat in perpetuity under a conservation easement dedicated to a local land conservancy or other appropriate entity that has been approved to hold and manage mitigation lands pursuant to Government Code § 65967(c). Recordation of the conservation easement shall occur prior to commencement of Project activities. An appropriate endowment shall also be provided for the long-term monitoring and management of mitigation lands.

3) Monarchs. There have been multiple observations of monarchs within one mile of the Project site through the CNDDB (CDFW 2025a). Additionally, the Project site falls within monarch Areas of Conservation Emphasis ACE, which displays the Project site having potential monarch overwintering habitat (CDFW 2025c). As the Project site may provide suitable habitat for monarchs, Project activities such as

Docusign Envelope ID: 6189D8AC-AD90-4ED4-A203-D05C1964E54D

tree and vegetation removal may directly impact monarch butterfly overwintering habitat. Additionally, noise from construction activities may disturb overwintering roosts. The DEIR should evaluate the Project's potential direct, indirect, and cumulative impacts on monarchs and overwintering habitat during the construction and operational phase of the Project. Findings should be incorporated in the DEIR for public review.

CDFW recommends the City retain a qualified biologist to assess the Project site for monarchs and overwintering habitat. The qualified biologist should survey trees within the Project site that are suitable for overwintering monarchs. The qualified biologist should conduct multiple surveys for overwintering monarchs where potential overwintering habitat has been identified. Monitoring should be done as frequently as possible during the overwintering season (typically September 15 through March 11) to capture changing distributions throughout the season and in response to storm events.

CDFW also recommends the City consult the following resources to develop appropriate measures to mitigate the Project's potential impacts on monarchs.

- Western Monarch Butterfly Conservation Plan (WAFWA 2019);
- Overwintering Site Management and Protection (Western Monarch Count 2022);
- Protecting California's Butterfly Groves (Xerces Society 2017);
- Managing Monarch Habitat in the West (Xerces Society 2025a);
- Pollinator-Friendly Native Plant Lists (Xerces Society 2025b); and,
- CDFW's Monarch Butterfly webpage (CDFW 2025d).

Given the candidate listing under the ESA, we also recommend the City scope the impacts to this species and possible mitigation options with the United States Fish and Wildlife Service (USFWS).

4) Fully Protected Species. The IS notes that white-tailed kite has moderate potential to forage within the Project site. Fully Protected Species may not be taken or possessed at any time according to the Fish and Game Code § 3511. CDFW cannot authorize take for white-tailed kite, and the City must completely avoid impacts to these species during Project's construction and operational activities. CDFW recommends that the DEIR contain a discussion of full avoidance of impacts to white-tailed kite and include a mitigation measure, if appropriate.

5) Nesting Birds and Raptors. The vegetation communities and trees within the Project site provide suitable habitat for nesting birds and raptors. Implementation of the Project activities, such as tree removal, during bird breeding and nesting season may result in the incidental loss of fertile eggs or nestlings, or otherwise lead to nest abandonment. CDFW recommends the City provide a discussion of the Project's

Docusign Envelope ID: 6189D8AC-AD90-4ED4-A203-D05C1964E54D

impact on nesting birds and raptors. Additionally, the City should incorporate measures in the DEIR to fully avoid impacts on nesting birds.

To avoid impacts to nesting birds, CDFW recommends that clearing of vegetation occur outside of the peak avian breeding season, which generally runs from February 1 through September 1 (as early as January 1 for some raptors). If Project construction is necessary during the bird breeding season, a qualified biologist with experience in conducting breeding bird surveys should conduct a nesting bird survey within three days prior to work in the area. If an active nest is identified, a buffer shall be established between the construction activities and the nest so that nesting activities are not interrupted. For the given Project site, CDFW generally recommends a 100-foot buffer from common avian species, 300 feet for listed or highly sensitive, and 500 feet for raptors. The buffer should be delineated by temporary fencing and remain in effect as long as construction is occurring. No Project construction shall occur within the nest zone until the young have fledged, are no longer being fed by the parents, have left the nest, and will no longer be impacted by the Project. Reductions in the nest buffer distance may be appropriate depending on the avian species involved, ambient levels of human activity, screening vegetation, or possibly other factors.

The California Fish and Game Code (Sections 3503, 3503.5, and 3513), prohibits take of all birds and their active nests, including raptors and other migratory nongame birds as listed under the Federal Migratory Bird Treaty Act of 1918 (Code of Federal Regulations, Title 50, § 10.13). It is unlawful to take, possess, or needlessly destroy the nest or eggs of any nesting bird.

General Comments

1) Disclosure. The DEIR should provide an adequate, complete, and detailed disclosure about the effects which a proposed project is likely to have on the environment (Pub. Resources Code, § 20161; CEQA Guidelines, § 15151). Such disclosure is necessary so CDFW may provide comments on the adequacy of proposed avoidance, minimization, or mitigation measures, as well as assess the significance of the specific impact relative to plant and wildlife species impacted (e.g., current range, distribution, population trends, and connectivity).

2) Project Description and Alternatives. To enable adequate review and comment on the proposed Project from the standpoint of the protection of fish, wildlife, and plants, CDFW recommends the following information be included in the DEIR.

   a. A complete discussion of the purpose and need for, and description of the proposed Project.

   b. A range of feasible alternatives to the Project location to avoid or otherwise minimize direct and indirect impacts on sensitive biological resources and wildlife movement areas. CDFW recommends the City select Project designs

Docusign Envelope ID: 6189D8AC-AD90-4ED4-A203-D05C1964E54D

and alternatives that would avoid or otherwise minimize direct and indirect impacts on biological resources. CDFW also recommends the City consider establishing appropriate setbacks from sensitive and special status biological resources. Setbacks should not be impacted by ground disturbance or hydrological changes from any future Project-related construction, activities, maintenance, and development. As a general rule, CDFW recommends reducing or clustering a development footprint to retain unobstructed spaces for vegetation and wildlife and provide connections for wildlife between properties and minimize obstacles to open space.

c. Project alternatives should be thoroughly evaluated, even if an alternative would impede, to some degree, the attainment of the Project objectives or would be more costly (CEQA Guidelines, § 15126.6). The DEIR shall include sufficient information about each alternative to allow meaningful evaluation, public participation, analysis, and comparison with the proposed Project (CEQA Guidelines, § 15126.6).

d. Where the Project may impact aquatic and riparian resources, CDFW recommends the City select Project designs and alternatives that would fully avoid impacts to such resources. CDFW also recommends an alternative that would not impede, alter, or otherwise modify existing surface flow, watercourse and meander, and water-dependent ecosystems and natural communities. Project designs should consider elevated crossings to avoid channelizing or narrowing of watercourses. Any modifications to a river, creek, or stream may cause or magnify upstream bank erosion, channel incision, and drop in water level, which may cause the watercourse to alter its course of flow.

3) Biological Baseline Assessment. An adequate biological resources assessment should provide a complete assessment and impact analysis of the flora and fauna within and adjacent to the Project site and where the Project may result in ground disturbance. The assessment and analysis should place emphasis on identifying endangered, threatened, rare, and sensitive species; regionally and locally unique species; and sensitive habitats. An impact analysis will aid in determining the Project's potential direct, indirect, and cumulative biological impacts, as well as specific mitigation or avoidance measures necessary to offset those impacts. CDFW also considers impacts to Species of Special Concern (SSC) a significant direct and cumulative adverse effect without implementing appropriate avoidance and/or mitigation measures. The DEIR should include the following information.

a. Information on the regional setting that is critical to an assessment of environmental impacts, with special emphasis on resources that are rare or unique to the region (CEQA Guidelines, § 15125(c)). The DEIR should include measures to fully avoid and otherwise protect Sensitive Natural Communities. CDFW considers Sensitive Natural Communities as threatened habitats having both regional and local significance. Natural communities, alliances, and

Docusign Envelope ID: 6189D8AC-AD90-4ED4-A203-D05C1964E54D

associations with a State-wide rarity ranking of S1, S2, and S3 should be considered sensitive and declining at the local and regional level. These ranks can be obtained by visiting the Vegetation Classification and Mapping Program - Natural Communities webpage[3].

b. A thorough, recent, floristic-based assessment of special status plants and natural communities following CDFW's *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities*[4]. Botanical field surveys should be comprehensive over the entire Project site, including areas that will be directly or indirectly impacted by the Project. Adjoining properties should also be surveyed where direct or indirect Project effects could occur, such as those from fuel modification, herbicide application, invasive species, and altered hydrology. Botanical field surveys should be conducted in the field at the times of year when plants will be both evident and identifiable. Usually, this is during flowering or fruiting. Botanical field survey visits should be spaced throughout the growing season to accurately determine what plants exist in the Project site. This usually involves multiple visits to the Project site (e.g., in early, mid, and late season) to capture the floristic diversity at a level necessary to determine if special status plants are present.

c. Floristic alliance- and/or association-based mapping and vegetation impact assessments conducted in the Project site and within adjacent areas. The Manual of California Vegetation[5], second edition, (Sawyer, Keeler-Wolf, & Evens, 2009) should also be used to inform this mapping and assessment. Adjoining habitat areas should be included in this assessment where the Project's construction and activities could lead to direct or indirect impacts offsite.

d. A complete and recent assessment of the biological resources associated with each habitat type in the Project site and within adjacent areas. A full literature review includes but is not limited to CDFW's California Natural Diversity Database[6] (CNDDB). The CNDDB should be accessed to obtain current information on any previously reported sensitive species and habitat. An assessment should include a minimum nine-quadrangle search of the CNDDB to determine a list of species potentially present in the Project site. A nine-quadrangle search should be provided in the Project's CEQA document for adequate disclosure of the Project's potential impact on biological resources.

e. A complete, recent, assessment of endangered, rare, or threatened species and other sensitive species within the Project site and adjacent areas, including SSC and California Fully Protected Species (Fish & G. Code, §§ 3511, 4700, 5050,

[3] https://wildlife.ca.gov/Data/VegCAMP/Natural-Communities
[4] https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=18959&inline
[5] https://vegetation.cnps.org/
[6] https://wildlife.ca.gov/Data/CNDDB

Docusign Envelope ID: 6189D8AC-AD90-4ED4-A203-D05C1964E54D

and 5515). Species to be addressed should include all those which meet the CEQA definition of endangered, rare, or threatened species (CEQA Guidelines, § 15380). Seasonal variations in use of the Project site should also be addressed such as wintering, roosting, nesting, and foraging habitat. Focused species-specific surveys, conducted at the appropriate time of year and time of day when the sensitive species are active or otherwise identifiable, may be required if suitable habitat is present. See CDFW's Survey and Monitoring Protocols and Guidelines[7] for established survey protocol. Acceptable species-specific survey procedures may be developed in consultation with CDFW and U.S. Fish and Wildlife Service.

f. A recent wildlife and rare plant survey. A lack of records in the CNDDB does not mean that rare, threatened, or endangered plants and wildlife do not occur. Field verification for the presence or absence of sensitive species is necessary to provide a complete biological assessment for adequate CEQA review (CEQA Guidelines, § 15003(i)). CDFW generally considers biological field assessments for wildlife to be valid for a one-year period, and assessments for rare plants may be considered valid for a period of up to three years. Some aspects of the proposed Project may warrant periodic updated surveys for certain sensitive taxa, particularly if Project implementation build out could occur over a protracted time frame or in phases.

4) Direct and Indirect Impacts on Biological Resources. The DEIR should provide a thorough discussion of direct and indirect impacts expected to affect biological resources with specific measures to offset such impacts. The DEIR should address the following.

a. A discussion of potential impacts from lighting, noise, temporary and permanent human activity, and exotic species, and identification of any mitigation measures. A discussion regarding Project-related indirect impacts on biological resources. These include resources in nearby public lands, open space, adjacent natural habitats, riparian ecosystems, and any designated and/or proposed or existing reserve lands (e.g., preserve lands associated with a Natural Community Conservation Plan (Fish & G. Code, § 2800 et. seq.)).

b. A discussion of both the short-term and long-term effects of the Project on species population distribution and concentration, as well as alterations of the ecosystem supporting those species impacted (CEQA Guidelines, § 15126.2(a)).

c. Impacts on, and maintenance of, wildlife corridor/movement areas, including access to undisturbed habitats in areas adjacent to the Project, should be fully analyzed and discussed in the DEIR.

[7] https://wildlife.ca.gov/conservation/survey-protocols

Docusign Envelope ID: 6189D8AC-AD90-4ED4-A203-D05C1964E54D

d. A discussion of post-Project fate of drainage patterns, surface flows, and soil erosion and/or sedimentation in streams and water bodies. The discussion should also address the potential water extraction activities and the potential resulting impacts on habitat supported by the groundwater. Measures to mitigate such impacts should be included.

e. An analysis of impacts from proposed changes to land use designations and zoning, and existing land use designation and zoning located nearby or adjacent to natural areas that may inadvertently contribute to wildlife-human interactions. A discussion of possible conflicts and mitigation measures to reduce these conflicts should be included in the DEIR.

5) Cumulative Impact. Cumulative impacts on biological resources can result from collectively significant projects which are individually insignificant. The Project, when considered collectively with prior, concurrent, and probable future projects, may have a significant cumulative effect on biological resources. The Project may have the potential to substantially reduce the number or restrict the range of endangered, rare, or threatened species. Species that may be impacted by the Project include, but are not limited to, the biological resources described in this letter.

   Accordingly, CDFW recommends the DEIR evaluate the Project's potential cumulative impacts on biological resources. The Project may have a "significant effect on the environment" if the possible effects of the Project are individually limited but cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects (Pub. Resources Code, § 21083(b)). The City's conclusions regarding the significance of the Project's cumulative impact should be justified and supported by evidence to make those conclusions. Specifically, if the City concludes that the Project would not result in cumulative impacts on biological resources, the City, "shall identify facts and analysis supporting the Lead Agency's conclusion that the cumulative impact is less than significant" (CEQA Guidelines section § 15130(a)(2)).

6) Mitigation Measures. Public agencies have a duty under CEQA to prevent significant, avoidable damage to the environment by requiring changes in a project through the use of feasible alternatives or mitigation measures (CEQA Guidelines, §§ 15002(a)(3), 15021). Pursuant to CEQA Guidelines section 15126.4, an environmental document shall describe feasible measures which could mitigate impacts below a significant level under CEQA. Mitigation measures must be feasible, effective, implementable, and fully enforceable/imposed by the lead agency through permit conditions, agreements, or other legally binding instruments (Pub. Resources Code, § 21081.6(b); CEQA Guidelines, § 15126.4).

Docusign Envelope ID: 6189D8AC-AD90-4ED4-A203-D05C1964E54D

a. The DEIR should provide mitigation measures that are specific and detailed (i.e., responsible party, timing, specific actions, location) in order for a mitigation measure to be fully enforceable and implemented successfully via a mitigation monitoring and/or reporting program (Pub. Resources Code, § 21081.6; CEQA Guidelines, § 15097).

b. If a proposed mitigation measure would cause one or more significant effects, in addition to impacts caused by the proposed Project, the DEIR should include a discussion of the effects of proposed mitigation measures (CEQA Guidelines, § 15126.4(a)(1)). In that regard, the DEIR should provide an adequate, complete, and detailed disclosure about the Project's proposed mitigation measure(s). Adequate disclosure is necessary so CDFW may assess the potential impacts of proposed mitigation measures.

7) Compensatory Mitigation. The DEIR should include compensatory mitigation measures for the Project's significant impacts (direct and/or through habitat modification) to sensitive and special status plants, animals, and habitats. Mitigation measures should emphasize avoidance and minimization of Project-related impacts. For unavoidable impacts, on-site habitat restoration or enhancement should be discussed in detail. If on-site mitigation is not feasible or would not be biologically viable and therefore inadequate to mitigate the loss of biological functions and values, off-site mitigation through habitat creation and/or acquisition and preservation in perpetuity should be addressed. Areas proposed as mitigation lands should be protected in perpetuity with a conservation easement and financial assurance and dedicated to a qualified entity for long-term management and monitoring.

8) Long-term Management of Mitigation Lands. For proposed mitigation lands, the DEIR should include measures to protect the targeted habitat values in perpetuity. The mitigation should offset Project-induced qualitative and quantitative losses of biological resources. Issues that should be addressed include (but are not limited to) restrictions on access, proposed land dedications, monitoring and management programs, control of illegal dumping, water pollution, and increased human intrusion. An appropriate endowment should be set aside to provide for long-term management of mitigation lands.

9) Translocation/Salvage of Plants and Animal Species. Translocation and transplantation is the process of removing plants and wildlife from one location and permanently moving it to a new location. CDFW generally does not support the use of translocation or transplantation as the primary mitigation strategy for unavoidable impacts to endangered, rare, or threatened plants and animals. These efforts are experimental, and the outcome is unreliable. CDFW has found that permanent preservation and management of habitat capable of supporting these species is often a more effective long-term strategy for conserving plants and animals and their habitats.

Docusign Envelope ID: 6189D8AC-AD90-4ED4-A203-D05C1964E54D

10) Scientific Collecting Permit and Voucher Collecting Permit. A Scientific Collecting Permit would be necessary if there is a plan to capture and relocate wildlife. Pursuant to the California Code of Regulations, title 14, section 650, qualified biologist(s) must obtain appropriate handling permits to capture, temporarily possess, and relocated wildlife to avoid harm or mortality in connection with Project-related activities. CDFW has the authority to issue permits for the take or possession of wildlife, including mammals; birds, nests, and eggs; reptiles, amphibians, fish, plants; and invertebrates (Fish & G. Code, §§ 1002, 1002.5, 1003). A Scientific Collecting Permit is required to monitor project impacts on wildlife resources, as required by environmental documents, permits, or other legal authorizations; and, to capture, temporarily possess, and relocate wildlife to avoid harm or mortality in connection with otherwise lawful activities (Cal. Code Regs., tit. 14, § 650). For more information, please see CDFW's Scientific Collecting Permit webpage[8].

    A voucher collection permit is required to collect state-listed plant species for identification purposes during field surveys, or to collect voucher specimens to document a newly-discovered or previously unvouchered occurrence of a state-listed plant. There is no charge to apply for a voucher collection permit. Anyone who collects scientific plant specimens of state-listed species, or who may encounter a state-listed species during field surveys should have a plant voucher collection permit. To apply for a Voucher Collecting Permit please see CDFW's Voucher Collecting Permit Page[9].

11) Lake and Streambed Alteration. CDFW has regulatory authority over activities in streams that will divert or obstruct the natural flow, or change the bed, channel, or bank (which may include associated riparian resources) of any river, stream, or lake or use material from a river, stream, or lake. For any such activities, the Project applicant (or "entity") must provide written notification to CDFW pursuant to section 1600 et seq. of the Fish and Game Code. Based on this notification and other information, CDFW determines whether a Lake and Streambed Alteration Agreement (LSAA) with the applicant is required prior to conducting the proposed activities. CDFW's issuance of a LSAA for a project that is subject to CEQA will require CEQA compliance actions by CDFW as a Responsible Agency. CDFW recommends that the City assess whether notification is appropriate. A Notification package for a LSAA may be obtained by accessing CDFW's Lake and Streambed Alteration Program website[10].

12) Wetland Resources. CDFW, as described in Fish and Game Code section 703(a), is guided by the Fish and Game Commission's (Commission) policies[11]. Through its Wetlands Resources policy, the Commission "…seek[s] to provide for the

[8] https://wildlife.ca.gov/Licensing/Scientific-Collecting
[9] https://wildlife.ca.gov/Conservation/Plants/Permits
[10] http://www.wildlife.ca.gov/Conservation/LSA
[11] https://fgc.ca.gov/About/Policies/Miscellaneous

Docusign Envelope ID: 6189D8AC-AD90-4ED4-A203-D05C1964E54D

protection, preservation, restoration, enhancement, and expansion of wetland habitat in California" (California Fish and Game Commission, 2005). It is the policy of the Commission to strongly discourage development in or conversion of wetlands. It opposes, consistent with its legal authority, any development or conversion that would result in a reduction of wetland acreage or wetland habitat values. To that end, the Commission opposes wetland development proposals unless, at a minimum, project mitigation assures there will be 'no net loss' of either wetland habitat values or acreage. The Commission strongly prefers mitigation which would achieve expansion of wetland acreage and enhancement of wetland habitat values."

a. The Wetlands Resources policy provides a framework for maintaining wetland resources and establishes mitigation guidance. CDFW encourages avoidance of wetland resources as a primary mitigation measure and discourages the development or type conversion of wetlands to uplands. CDFW encourages activities that would avoid the reduction of wetland acreage, function, or habitat values. Once avoidance and minimization measures have been exhausted, a project should include mitigation measures to assure a "no net loss" of either wetland habitat values, or acreage, for unavoidable impacts to wetland resources. Conversions include, but are not limited to, conversion to subsurface drains, placement of fill or building of structures within the wetland, and channelization or removal of materials from the streambed. All wetlands and watercourses, whether ephemeral, intermittent, or perennial, should be retained and provided with substantial setbacks, which preserve the riparian and aquatic values and functions benefiting local and transient wildlife populations. CDFW recommends mitigation measures to compensate for unavoidable impacts be included in the DEIR and these measures should compensate for the loss of function and value.

b. The Fish and Game Commission's Water policy guides CDFW on the quantity and quality of the waters of this State that should be apportioned and maintained respectively so as to produce and sustain maximum numbers of fish and wildlife; to provide maximum protection and enhancement of fish and wildlife and their habitat; encourage and support programs to maintain or restore a high quality of the waters of this State; prevent the degradation thereof caused by pollution and contamination; and, endeavor to keep as much water as possible open and accessible to the public for the use and enjoyment of fish and wildlife. CDFW recommends avoidance of water practices and structures that use excessive amounts of water, and minimization of impacts that negatively affect water quality, to the extent feasible (Fish & G. Code, § 5650).

13) Use of Native Plants and Trees. CDFW recommends the City require the Project Applicant to provide a native plant palette for the Project. The Project's landscaping plan should be disclosed and evaluated in the DEIR for potential impacts on biological resources such as natural communities adjacent to the Project site (e.g.,

Docusign Envelope ID: 6189D8AC-AD90-4ED4-A203-D05C1964E54D

introducing non-native, invasive species). CDFW supports the use of native plants for the Project especially considering the Project's location adjacent to protected open space and natural areas. CDFW strongly recommends avoiding non-native, invasive species for landscaping and restoration, particularly any species listed as 'Moderate', 'High', 'Limited', and 'Watch' by the California Invasive Plant Council[12] CDFW supports the use of native species found in naturally occurring plant communities within or adjacent to the Project site. In addition, CDFW supports planting native species of trees, such as oaks (Quercus genus), and understory vegetation (e.g., ground cover, vines, subshrubs, and shrubs) that create habitat and provide a food source for birds. CDFW recommends retaining any standing, dead, or dying tree (snags) where possible because snags provide perching and nesting habitat for birds and raptors. Finally, CDFW supports planting species of vegetation with high insect and pollinator value.

ENVIRONMENTAL DATA

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations. (Pub. Resources Code, § 21003, subd. (e).) Accordingly, please report any special status species and natural communities detected during Project surveys to the California Natural Diversity Database (CNDDB). The CNDDB website[13] provides direction regarding the types of information that should be reported and allows on-line submittal of field survey forms.

In addition, information on special status native plant populations and sensitive natural communities, should be submitted to CDFW's Vegetation Classification and Mapping Program using the Combined Rapid Assessment and Relevé Form[14].

The City should ensure data collected for the preparation of the DEIR is properly submitted.

FILING FEES

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying project approval to be operative, vested, and final. (Cal. Code Regs, tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089.)

CONCLUSION

CDFW appreciates the opportunity to comment on the NOP to assist the City in identifying and mitigating Project impacts on biological resources.

Questions regarding this letter or further coordination should be directed to Joleena De La Fe, Environmental Scientist[15].

Kelly Bourque
City of Santa Barbara
630 Garden Street
Santa Barbara CA 93101

Re 2025110233 Vic Trace Reservoir Replacement Project, Santa Barbara County

Dear Ms. Bourque:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

- **a.** A brief description of the project.
- **b.** The lead agency contact information.
- **c.** Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
- **d.** A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

- **a.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

- **a.** Alternatives to the project.
- **b.** Recommended mitigation measures.
- **c.** Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

- **a.** Type of environmental review necessary.
- **b.** Significance of the tribal cultural resources.
- **c.** Significance of the project's impacts on tribal cultural resources.
- **d.** If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

- **a.** Whether the proposed project has a significant impact on an identified tribal cultural resource.
- **b.** Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).

2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.

3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).

4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:

- **a.** The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
- **b.** Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (https://ohp.parks.ca.gov/?page_id=30331) for an archaeological records search. The records search will determine:

- **a.** If part or all of the APE has been previously surveyed for cultural resources.
- **b.** If any known cultural resources have already been recorded on or adjacent to the APE.
- **c.** If the probability is low, moderate, or high that cultural resources are located in the APE.
- **d.** If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.

- **a.** The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
- **b.** The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:

a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.

b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.

a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.

b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.

c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Mathew.Lin@NAHC.ca.gov.

Sincerely,

Mathew Lin

Vic Trace Reservoir Replacement Project
SCH# 2025110233
Santa Barbara County

Dear Ms. Bourque:

The Division of Safety of Dams (DSOD) has reviewed the Notice of Preparation (NOP) for the Vic Trace Reservoir Replacement Project, submitted by the City of Santa Barbara, which describes work to replace and upgrade water infrastructure and improve existing facilities.

As defined in section 6004(a) of the California Water Code, a circular tank constructed of steel or concrete, or both, shall not be considered a dam.

Based on the plans provided in the submitted NOP, the proposed project consists of circular concrete tanks which impound the reservoirs and therefore will not be subject to State jurisdiction. If changes to the design of the reservoirs are made which alter the shape of the tank, the structure may be subject to State jurisdiction for dam safety. In the event the project will result in a State jurisdictional structure, a construction application, together with plans, specifications, and the appropriate filing fees must be filed with DSOD prior to proceeding with the project.

If an application is required, all dam safety related issues must be satisfactorily addressed prior to our approval of the application and all work must be performed under the direction of a Civil Engineer registered in California. Our Design Engineering Branch Manager Ian Maki is responsible for the application process and can be reached at (916) 820-7795.

If you have any questions or need additional information, you may contact Area Engineer Cameron Lancaster at (916) 565-7830 or me at (916) 565-7827.

Sincerely,

Brandon Cruz

Re: Santa Barbara County Air Pollution Control District Response to Notice of Preparation of an Environmental Impact Report for the Vic Trace Reservoir Replacement Project, PRE2025-00035

Dear Ms. Bourque:

The Santa Barbara County Air Pollution Control District (District) appreciates the opportunity to provide comments on the Notice of Preparation (NOP) of a Draft Environmental Impact Report (EIR) for the Vic Trace Reservoir Replacement Project. The City of Santa Barbara proposes to replace the existing 10 million gallon (MG) City of Santa Barbara drinking water reservoir with two new, underground 5 MG finished drinking water storage reservoirs and other on- and off-site improvements. The Vic Trace Reservoir parcel covers 14.726 acres and is located on City owned property in the Alta Mesa neighborhood at 740 Dolores Drive, Santa Barbara (Assessor's Parcel Number [APN] 035-033-031). Construction of the proposed Project is expected to occur over approximately three years, anticipated to begin in July 2028 and end in August 2031. Aspects of the projects that may involve air quality impacts and/or District permitting include construction activities, the re-abandonment of an existing abandoned oil well, and the installation and operation of a standby 150 kilowatt (kW) diesel generator at the new Valve Building and a 50 kW diesel generator at the IT building.

District staff reviewed the Initial Study and NOP of a Draft EIR and concurs that air quality impacts will be potentially significant and should be addressed in the EIR. Air quality impacts should be avoided as much as feasible through project design features, efficiencies, mitigation, and monitoring. The proposed project will include equipment and operations that may be subject to District permit requirements and prohibitory rules. Therefore, the District will be a responsible agency under the California Environmental Quality Act (CEQA) and will seek to rely on the EIR when evaluating any District permits for proposed equipment. In order to avoid additional CEQA documentation related to District permit issuance, the EIR should include the air pollutant emissions for all proposed operations and equipment in the project's air quality impact analysis, adequately analyze all potential air quality impacts (including health risk from toxic air contaminants) and include mitigation as appropriate to reduce the impacts. The District's guidance document, entitled *CEQA Handbook* (updated October 2025), is available online at www.ourair.org/environmental-review-resources-and-notices. This document should be referenced for general guidance in assessing air quality impacts in the Draft EIR.

We recommend the EIR closely evaluate the following potential impacts related to the project:

1. **Health Risk Assessment for Proposed Diesel Generator Engines**: The proposed diesel standby engines will require a District permit. As part of District permit issuance, a Health Risk Assessment (HRA) will be required to determine the potential level of health risk associated with the emission of toxic air contaminants (TACs) from proposed operations. The District will not issue a permit if an HRA shows that a significant impact will occur. Therefore, we recommend that the HRA be performed upfront during the land use permitting process to ensure that the project will not result in a significant impact under the Lead Agency's health risk thresholds and that the project as proposed will be permissible by the District. The District-approved results of the HRA should be included in the CEQA document for the project.

   Please perform either a screening-level HRA and/or refined HRA and submit to the District for review and approval. The applicant is advised to consult with the District to verify the adequacy of modeling parameters before running either a screening-level or refined HRA. If the results from the screening-level HRA show that health risk from the project exceeds the Lead Agency's significance thresholds, a refined HRA should be performed in accordance with the latest District *Modeling Guidelines for Health Risk Assessments*, Form-15i, available at www.ourair.org/permit-applications. Alternatively, at their option, the applicant may forgo the initial screening-level assessment and proceed directly to preparation of a refined HRA. Please contact David Harris, Manager of the District's Engineering Division, at HarrisD@sbcapcd.org or (805) 979-8311 for HRA-related inquiries and refer to the District's webpage www.ourair.org/air-toxics-for-business for general information on HRAs.

2. **Construction Impacts.** Construction of the project will involve a substantial use of off-road equipment, heavy-duty diesel trucks, and earth-movement within close proximity to existing sensitive receptors, including residences. As noted in the Initial Study, potential impacts related to dust and particulates from grading and exhaust emissions during project construction, as well as particulate matter, ozone precursors, and toxic air contaminants from use of diesel and gasoline powered construction equipment are potentially significant and should be evaluated in the EIR. As recommended in the District's preliminary comments on the project (letter dated April 10, 2025), we recommend that the project commits to project design measures for the reduction of equipment exhaust (and diesel particulate matter) including the following:

   - Exhaust emissions shall be minimized during construction activities with the use of off-road equipment engines that meet or exceed CARB's Tier 4 Final engine emissions standards for off-road equipment exceeding 50 horsepower (hp). At a minimum, all construction equipment shall be certified as compliant with the Tier 4 Final engine emissions standards as provided in CCR, Title 13, section 2423(b)(1)(B). Engines can achieve these standards through the use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, aftertreatment products, add-on devices such as particulate filters, or other options as they become available. Where available, off-road construction equipment should be zero-emission.

   - All portable generators are required to be powered by a source other than diesel fuel or gasoline (i.e. battery, natural gas, propane etc.).

We note that the Initial Study includes Standard Conditions of Approval AQ-1: *Construction Phase Dust and Diesel Exhaust Control*. However, the condition dictates that several of the measures "should be" adhered to (i.e. measure "l" and "n" related to Tier 4 or zero-emission equipment and prohibition on diesel or gasoline generators). If the City intends to make these measures enforceable conditions of approval, we request that the language be revised to "shall be" and that these measures are included in the project's Mitigation Monitoring and Reporting Plan to establish a clear mechanism for enforcement. If the project is not required to implement the above noted measures, our recommendation to conduct a construction HRA as part of the impact evaluation remains applicable.

3. **Global Climate Change/Greenhouse Gas Impacts**. The EIR should include a quantification of GHG emissions from all project sources (direct and indirect), present significance thresholds, and make a determination regarding the significance of impacts. In addition, we recommend that climate change impacts be mitigated to the extent reasonably possible, whether they are determined to be significant. At a minimum, the project should be constructed and operated to minimize GHG emissions. Some potential measures include, but are not limited to:
    - Energy use (energy efficiency, low carbon fuels, renewable energy)
    - Water conservation (improved practices and equipment, landscaping)
    - Waste reduction (material re-use/recycling, composting, waste diversion/minimization)
    - Architectural features (green building practices, cool roofs)
    - Incorporate high efficiency process equipment
    - Reduction in vehicle trips from haul vehicles
    - Utilization of a truck fleet with the newest/cleanest possible vehicles
    - Utilization of a truck fleet with alternatively fueled vehicles

We hope you find our comments useful and look forward to reviewing the Draft EIR. Please contact me at (805) 979-8337 or via email at BarhamC@sbcapcd.org if you have questions.

Sincerely,

Carly Barham

Dear Kelly, Bronwyn and Mike,

We the undersigned are the owners of the 6 homes that directly abut the Dolores Drive open space below Vic Trace reservoir. Most of us have occupied these homes for several decades. The undeveloped natural state of this open space has been a source of enjoyment for all of us and our neighbors from the surrounding area. It's a great place to walk, to explore with kids, have a picnic, bring a pet or just sit and have some quiet time.

This small area is also the natural home and habitat to many of our native flora and fauna, including generations of Red-Tailed Hawks, Red-Shouldered Hawks and Great Horned Owls maintaining regular seasonal nesting sites here.

We are writing to let you know that we unanimously request that this area remain as-is as much as possible after the necessary modifications required for the reservoir are completed. It's a unique place, a bit wild, well preserved and loved and appreciated by many for the past 70 years now.

We hope that we can continue to enjoy it.

Thank you for your consideration.

Subject: Fw: VTRP-concerns about noise intrusion

To the Project Managers of The Vic Trace Project,

This Vic Trace work is not sustainable for residents. The noise has been harmful to us. We are deeply concerned about the ground beneath us, all of the mature trees you plan to chop down, the environmental impact, the noise impact, etc. on our personal properties.

We don't need disconnected,
ivory tower talking heads making decisions neck up that are hurting the bodies of long time Santa Barbara Mesa residents. Please stop this madness. It is hurting real people. Otherwise, neighbors are forced to band together to fight this. It has caused enough disruption and chaos already. You say the plans will go from 7 am until 5:50 Monday through Friday, through 2031?! The idea of YEARS more of this is unimaginable.

To The Project Managers of The Vic Trace Resevoir Project,

We have a few questions we would like addressed about the noise pollution of The Vic Trace Resevoir Project,

Who is responsible for addressing homeowner grievances?

What is our legal recourse to the flagrant disregard of legal decibel limits?

How were residents included in decision making on the Vic Trace Resevoir Project?

Going forward, how will residents be included in decision making on the Vic Trace Resevoir Project?

What are resident rights with regard to the Vic Trace Resevoir Project?

Is it possible to limit and reduce the number of hours of noise per day on the Vic Trace Resevoir Project?

Who is measuring the decibels in n The Vic Trace Resevoir Project?

How often is the noise level being measured on The Vic Trace Resevoir Project?

We can tell you that you would not stand for this level of disruption and noise levels outside if your home, in your own neighborhood.

Sincerely, Mesa Neighbors

I was not able to attend the zoom meeting tonight, but do have serious concerns about the Vic Trace Resevoir Project thus far. I got updated by some neighbors. My concerns are the SEVERE noise , the environmental impact and safety of the land , the geology and soil damages, the disruptions, the noisy trucks and the yelling workmen, how the noise will impact our renters, how the volume of the noise is having a detrimental effect on our health, the potential impact to our water quality, the hydrology, the waste of government money. Residents and renters of Alta Mesa are FED UP & do not want The Vic Trace Intrusions to continue.

Kindly,
Kathy

Subject: Vic Trace Project questions SOS

Hi,

1. How are you keeping La Coronilla /Alta Mesa residents informed of the noise and disruptions of the Vic Trace Project?

2. How long is the Vic Trace Project expected go on?

3. What, specifically, are you doing to mitigate the noise pollution & disruption to resident people and animals? The constant loud vibrating and booming noise is impacting our right to the enjoyment of our property.

4. Are any further steps that Alta Mesa residents can take to limit the scope,

volume, and/or length of the intrusively loud Vic Trace Project?

5. Who do we go to, specifically, to address and measure the unhealthy, exceeding loud decibel concerns we have?

Thank you, Scott Family

Subject: Cutting trees down

[You don't often get email from pagejacqui@msn.com. Learn why this is important at https://aka.ms/LearnAboutSenderIdentification]

My house borders the Vic Trace property on La Vista Del Oceano. The reservoir grounds have always been plagued by golfers that have tunneled extensively even causing drainage problems on my property. Fortunately we have a population of Great Horned Owls and Hawks that call the large tress on Vic Trace home and prey on these destructive rodents. I was told that the tress would be removed and replaced with small trees. Great Horned Owls and hawks need LARGE trees to nest. Please keep the existing trees. I feel that removing these trees is totally unnecessary and would increase the golfer problem. Please reconsider.

Hello,

I attended the Zoom Meeting on December 4th. Here is a list of many of the concerns about The Vic Trace Resevoir Project impact on our family, neighbors, pets, renters, and guests.

Our family and neighbors are deeply concerned about the untenable levels of noise of this Vic Trace Reservoir project.

The noise levels have ALREADY negatively impacted, hurt, and harmed us.

The proposed hours , days, months, and years you shared in your PowerPoint at the zoom meeting hit us hard. You probably don’t have to live with the consequences of the noise and disruptions of the project you oversee. It’s too much.

How will we continue to live in these conditions? The Vic Trace Project has already been so hard and troublesome to all of us living here, particularly, the sensory overwhelm of the noise. Our neighbor child with special needs is holding his hands over his ears, crying with the volume of the noise. Our neighbor who works from home says he can not concentrate at all under these conditions. I, personally, have had a serious increase in occurrence of migraine headaches from the incessant noise. It is impacting all of us in terrible ways.

Additionally, what will this Vic Trace Reservoir Project do to the ground and the soil here in Alta Mesa?

We have serious concerns here about erosion, landslides and mudslides already!

This digging is likely to destabilize this land further! And uprooting established trees will only weaken the land more! We don't want to lose our elder trees for this and many other reasons.

Erosion and potential landslides and/or mudslides deeply concern our particular Alta Mesa neighborhood, as we are built on eroding cliffs already.

Further, we have serious concerns about the greenhouse gas emissions from The Vic Trace Reservoir Project.

We also have serious concerns about the hazardous construction materials used, the dangerous impact it will have on our air, land and water quality on Alta Mesa.

The Vic Trace Reservoir Project trucks are so noisy, are big polluters, and are a nuisance for us just to try to go to our homes through our streets.

It is affecting a simple drive down our streets, where we can park, as well as where our renters and guests can park.

The trucks are dangerous for kids and pets. The trucks themselves are noisy, stinky, and the volume of the construction noise impact where kids can play safely in our neighborhood.

The workmen all yell to each other over the noise. They blast radio music over the construction noise all day. It adds to the cacophony.

The construction noise plus the noise of the yelling workmen have caused all of the neighborhood dogs to constantly bark on top of the construction noise. More cacophony.

There has been more trash left on the ground on our streets, as well.

Lastly, we were disappointed that the comments, questions, and answers were intentionally turned off on our Zoom meeting about the project.

Thank you, in advance, for listening to residents impacted by this project. Please do more to mitigate the damages.

Sincerely, Scott family
(La Coronilla homeowners)

We Want to Hear from You!

VIC TRACE RESERVOIR REPLACEMENT PROJECT

Environmental Issues and Impacts

What are the main environmental concerns you feel should be addressed in the Draft EIR?

- ☐ Aesthetics
- ☐ Agriculture/Forestry Resources
- ☒ Air Quality
- ☐ Biological Resources
- ☐ Cultural Resources
- ☐ Energy
- ☐ Geology and Soils Vibration
- ☐ Greenhouse Gas Emissions
- ☐ Hazards/Hazardous Materials
- ☐ Hydrology/Water Quality
- ☐ Land Use/Planning
- ☐ Mineral Resources
- ☒ Noise
- ☒ Population/Housing
- ☐ Public Services
- ☐ Recreation
- ☒ Transportation
- ☐ Tribal Cultural Resources
- ☐ Utilities/Service Systems
- ☐ Wildfire

Comments

Use the space below to provide input on environmental issues, project alternatives, and mitigation measures that should be considered in the preparation of the Draft EIR.

We are new home owners to the neighborhood & ~~on~~ Ricardo part of our street is a dead end and I'm very concerned about construction traffic on this street and access to our driveway.

I run my company from home (now for 14 years) and am very concerned about noise (and duration of noise that would be disruptive for daily zoom calls etc.

We are also concerned about heavy impact that could cause damage (cracks) etc to our home.

Santa Barbara, California 93102
Via email: KBourque@SantaBarbaraCA.gov

Subject: Federal Clean Air Act General Conformity Applicability Analysis for the Vic Trace Reservoir Replacement Project, Santa Barbara, California

Dear Kelly Bourque:

This letter has been prepared for the State Water Resources Control Board (SWRCB) on behalf of the City of Santa Barbara (City) and serves as the General Conformity Applicability Analysis for the Vic Trace Reservoir Replacement Project (herein referred to as "proposed action" or "Project"). The City intends to pursue federal funding opportunities for the proposed action, including funding from the Drinking Water State Revolving Fund (DWSRF). In California, administration of the DWSRF program has been delegated by the United States Environmental Protection Agency (USEPA) to the SWRCB. In turn, the SWRCB requires that all projects being considered under the DWSRF program comply with certain federal environmental protection laws, including the federal Clean Air Act (FCAA). The FCAA requires that any federal agency taking an action, including funding an action, make a determination that its action would not conflict with a State Implementation Plan (SIP). As part of the implementation of the FCAA, the USEPA has developed rules for transportation projects and non-transportation projects. The rule applicable to the proposed action is referred to as the "General Conformity Rule." Therefore, the purpose of this letter is to evaluate the proposed action's conformity to the applicable SIP and consistency with the FCAA General Conformity Rule.

Location and Description of Proposed Action

The Project site encompasses the Vic Trace Reservoir parcel, 1633 La Coronilla Drive, and various water infrastructure improvements in the Alta Mesa neighborhood in the City of Santa Barbara, California.

The Vic Trace Reservoir parcel covers approximately 15 acres (14.726 acres) and is located on City-owned property at 740 Dolores Drive, Santa Barbara (Assessor's Parcel Number [APN] 035-033-031). The parcel contains existing water infrastructure facilities, existing City communication facilities, and La Coronilla Park. Access to the Vic Trace Reservoir parcel is from La Coronilla Drive between residences at 1617 and 1633 La Coronilla Drive via an existing 20-foot-wide easement through the 1617 La Coronilla Drive property.

A single-family residence located at 1633 La Coronilla Drive is owned by the City of Santa Barbara and is proposed to be used for temporary construction offices during the Project.

Underground water main pipeline (main) work is proposed within the public right-of-way (ROW) paved roadways near the Vic Trace Reservoir Parcel, including La Coronilla Drive, Dolores Drive, Ricardo Avenue, and La Vista Del Oceano. The site supports an existing reservoir that consists of a 10-million-gallon (MG), buried, hopper bottom, concrete-lined reservoir with associated piping. The reservoir extends approximately 20 feet in depth and has an overall footprint of approximately 380 feet by 250

feet. Associated outbuildings, including a valve building and generator building, are located northeast of the reservoir.

The proposed Project would replace the existing reservoir with a new reservoir structure in roughly the same location with the same 10 MG capacity. While multiple design alternatives are being considered, the current preferred alternative consists of two 206-foot diameter, 5 MG, prestressed concrete tanks. Additionally, the Project will also include the construction of new valve and pump station building, retaining walls, a renewable energy system, paved access roads, piping to and from the new tanks, as well as the replacement and resizing of existing pipelines and utilities onsite and offsite in the right-of-way. In general, traditional cut-and-cover trenching techniques are anticipated for the installation of the piping and utilities.

As part of the Project, new water conveyance pipelines and a new Pressure Reducing Valve (PRV) station are to be constructed. These new improvements will generally be located along La Coronilla Drive and Dolores Drive.

Construction

Construction activities would generally occur from 7:00 A.M. to 5:00 P.M., Monday through Friday. While the majority of construction would occur during daytime hours and weekdays, occasional nighttime or weekend activities may be required to minimize water outages.

Construction of the proposed Project is expected to occur over approximately three years and begin in July 2028. Table 1 provides the estimated construction durations. Project activities may occur concurrently.

Table 1 Project Construction Schedule

Activity	Duration
Vic Trace Reservoir Shutdown, Drainage, and Demolition	4 months
Oil Well Re-abandonment	6 months
New Reservoir Construction	16.5 months
Vic Trace Reservoir Site Improvements	19.5 months
On and offsite Pipeline Construction	5.5 months
PRV Station Relocation	3.5 months

During the grading phase, approximately 83,000 cubic yards of soil would be excavated and exported off-site (based on preliminary design). Approximately 4,417 tons of concrete and steel would be demolished and exported offsite. Demolition and other debris would likely be hauled to the South Coast Recycling & Transfer Station (4430 Calle Real, Goleta), which would direct trash to the Tajiguas Landfill (14470 Calle Real, Goleta).

Project construction activities would include grading the site, re-abandoning the oil well, constructing two 5 MG reservoirs, constructing retaining walls to create terraced areas, and constructing the Valve and Pump Station Building.

The Relocated La Coronilla Transmission Main, New Vic Trace Outlet Main, Replaced Dolores Drive Main, and New Ricardo Avenue Main would be constructed using open-cut trench methods. Open-cut trench pipeline installation typically consists of trench excavation (including saw cutting of pavement where

applicable), removal of pipeline, pipe bedding stabilization, pipe installation, and backfill. The construction crew would typically operate a backhoe and/or excavator, compaction equipment (attachment on an excavator and hand-operated equipment), dump trucks for stockpiling of soils and delivery of backfill material, utility trucks (with truck-mounted or towed generator and hand tools), and water trucks/water buffalos.

Operation and Maintenance

Upon completion of construction activities, regular operation, maintenance, and IT activities at the Vic Trace Reservoir parcel would resume and would be similar to existing conditions. Compared to existing conditions, electricity consumption would increase by approximately 70,000 kWh per year to power the new Valve and Pump Station Building and new security systems not currently in place.

Existing Conditions

The Project site is located within the South Central Coast Air Basin (SCCAB), which includes San Luis Obispo, Santa Barbara, and Ventura counties. The Santa Barbara County Air Pollution Control District is responsible for local control and monitoring of criteria pollutants throughout the Santa Barbara County portion of the SCCAB. The Santa Barbara County portion of the SCCAB is designated attainment or unclassified for all National Ambient Air Quality Standards (NAAQS).[1]

Regulatory Framework

Section 176(c) of the FCAA, as amended (42 United States Code [U.S.C.] 7401 et seq.) prohibits federal agencies from engaging in, supporting, providing financial assistance to, or issuing permits for activities, which do not conform to an applicable SIP. As codified in Title 40 Code of Federal Regulations (CFR) Part 51 Subpart W and 40 CFR Part 93 Subpart B: General Conformity, the FCAA requires federal agencies to ensure that actions taken by those agencies conform to the applicable SIP. The FCAA applies only to direct and/or indirect emissions caused by the actions that occur in areas designated as nonattainment or maintenance areas with respect to NAAQS. These regulations require an applicability analysis to determine whether the federal action must be supported by a conformity determination. Under the General Conformity Rule, the FCAA applicability analysis is established for federal actions performed in locations with a history of non-compliance, as described below:

a. An area that is in nonattainment (i.e., has recorded violations of the NAAQS) for each criteria pollutant (such as ozone, carbon monoxide, and particulate matter) for which the area is designated nonattainment
b. An area designated as nonattainment that was later re-designated by the Administrator of the USEPA as an attainment area and that is therefore required to develop a maintenance plan under 42 U.S.C. Section 7505a with respect to the specific pollutant(s) for which the area was previously designated nonattainment

[1] United States Environmental Protection Agency. 2025. "Nonattainment Areas for Criteria Pollutants (Green Book). Last modified: July 31, 2025. https://www.epa.gov/green-book (accessed December 2025).

The applicability analysis involves calculation of the total emissions of criteria or precursor pollutants during the years of construction and operation of the federal action. If annual emissions exceed the *de minimis* rates outlined in the General Conformity Rule specified in 40 CFR Part 93.153(b), then the federal agency must prepare a formal General Conformity Determination for public comment. If the proposed action's annual emissions are below the applicable *de minimis* rates, the proposed action conforms to the SIP and is not subject to a formal general conformity determination.[2] As discussed under *Existing Conditions*, the SCCAB is designated attainment or unclassified for all NAAQS; therefore, no *de minimis* rates are applicable to the proposed action.

Methodology

Air pollutant emissions generated by Project construction were estimated using the California Emissions Estimator Model (CalEEMod), version 2022.1.1.29. CalEEMod uses project-specific information, including the project's land uses, square footages, and location to model a project's construction and operational emissions. The Project would not introduce any new operational sources of air pollution; therefore, only construction emissions were modeled. The analysis reflects construction and operation of the proposed action as described under *Location and Description of Proposed Action*.

Construction emissions modeled include emissions generated by construction equipment used on-site and emissions generated by vehicle trips associated with construction, such as worker, vendor, and haul trips. Construction of the proposed action was analyzed based on the construction schedule and construction equipment list provided by the Project applicant. It is assumed all construction equipment would be diesel-powered.

General Conformity Applicability Assessment

The proposed action may be funded by a loan from the DWSRF, a USEPA loan program administered at the state level by the SWRCB. Therefore, the emissions generated during construction of the proposed action are subject to FCAA requirements under the General Conformity Rule.

Table 2 lists the total annual emissions that would be generated from construction activities associated with the proposed action. As detailed earlier, no *de minimis* rates are applicable to the proposed action. As such, because the proposed action would not exceed applicable *de minimis* rates, general conformity requirements do not apply, and the proposed action is exempt from a General Conformity Determination.

[2] State Water Resources Control Board. 2017. Appendix I: State Environmental Review Process – State Water Resources Control Board Clean Water State Revolving Fund Program. April 2017. https://www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/docs/policy0513/appendix_i_envguide.pdf (accessed September 2022).

Table 2 Total Annual Emissions of Proposed Action (tons/year)

Source	VOC[1]	NO_2[2]	CO	SO_2	PM_{10}	$PM_{2.5}$
Maximum Annual Construction Emissions	0.7	5.1	6.4	<0.1	0.5	0.2
De Minimis Rates[3]	N/A	N/A	N/A	N/A	N/A	N/A
De Minimis Rates Exceeded?	N/A	N/A	N/A	N/A	N/A	N/A

VOC: volatile organic compounds; NO_X: nitrogen oxides; NO_2: nitrogen dioxide; CO: carbon monoxide; SO_2: sulfur dioxide; PM_{10}: particulate matter 10 microns or less in size; $PM_{2.5}$: particulate matter 2.5 microns or less in size; N/A: not applicable

[1] VOC is equivalent to reactive organic gases (ROG) as calculated by CalEEMod.

[2] NO_2 was conservatively assumed to be equivalent to NO_X.

[3] Since the SCCAB is in attainment or unclassified for all NAAQS, there are no applicable *de minimis* rates for the proposed action.

Notes: All numbers have been rounded to the nearest tenth. All emissions modeling was completed using CalEEMod. See Attachment 1 for modeling results.

Regardless of basin attainment status, the SWRCB requires that estimates of criteria pollutant emissions associated with the proposed action and supporting calculations be submitted with Attachment E1 of the DWSRF Environmental Package. The results of this assessment will be summarized in Attachment E1 of the DWSRF Environmental Package, and this memorandum will be included as supporting documentation.

Sincerely,

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	TOG	ROG	NOx	CO	SO2	PM10E	PM10D	PM10T	PM2.5E	PM2.5D	PM2.5T	BCO2	NBCO2	CO2T	CH4	N2O	R	CO2e

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	6.89000	annual days of extreme heat
Extreme Precipitation	6.85000	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00000	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	20.8463
AQ-PM	12.2589
AQ-DPM	47.3180
Drinking Water	17.2849
Lead Risk Housing	40.1512
Pesticides	0.00000
Toxic Releases	11.2028
Traffic	27.7250
Effect Indicators	—
CleanUp Sites	46.3419
Groundwater	82.5004
Haz Waste Facilities/Generators	47.4123
Impaired Water Bodies	66.7367

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	35.0000
Healthy Places Index Score for Project Location (b)	83.0000
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

8.1. Justifications

Screen	Justification
Land Use	Per preliminary design report and applicant provided KMZ files. Full site acreage assumed to be graded/paved. Reservoir structure modeled as unenclosed parking structure. Linear activity modeled as user defined linear and includes new PRV and La Vista Del Oceano entry/exit pits.
Construction: Construction Phases	Phase lengths based on PDR and PD with adjustments to reflect start date of 7/1/2028. Phase overlap based on PDR. PRV installation assumed to occur simultaneously with all other pipe install.
Construction: Off-Road Equipment	Per applicant provided information.
Construction: Dust From Material Movement	Per preliminary design report
Construction: Trips and VMT	Per project-specific traffic analysis memorandum. Building Construction trips attributed to "Site Improvements & Utilities" Phase because it fully overlaps with Reservoir Construction phase.
Operations: Energy Use	Per project description.

8.3. Land Use

Model Parameter	Units	Default Value	New Value
Lot Area	acre	12,574.0	12.5700
Landscape Area	sq. ft	—	0.00000

1 Project Description

1.1 Introduction

This Health Risk Assessment (HRA) analyzes the possible health effects associated with toxic air contaminant (TAC) emissions from construction and operation of the Vic Trace Reservoir Replacement Project ("Project" or "proposed Project") on residents located in proximity to the Project site and offsite infrastructure improvements. The proposed Project includes the following main elements: Vic Trace Reservoir Parcel Improvements, offsite underground water pipelines, and an offsite underground Pressure Reducing Valve (PRV) station relocation.

1.2 Executive Summary

This HRA reviews toxic air emissions from construction and operation of the Project to sensitive receptors near the Project site. Sensitive receptors are more susceptible to adverse health effects from diesel particulate matter (DPM) due to their age and health status. The Santa Barbara County Air Pollution Control District (SBCAPCD) identifies schools, residences, daycares, and eldercare facilities as examples of sensitive receptors.[1] Therefore, this HRA reviews toxic air emissions from construction and operation to offsite sensitive receptors.

The proposed Project includes the replacement of the existing Vic Trace Reservoir and implementation of various infrastructure replacements and improvements. The proposed Project would replace the existing reservoir with a new reservoir structure in roughly the same location with the same 10 MG capacity. Additionally, the Project will also include the construction of new valve and pump station building, retaining walls, a renewable energy system, paved access roads, piping to and from the new tanks, as well as the replacement and resizing of existing pipelines and utilities onsite and in the right-of-way. In general, traditional cut-and-cover trenching techniques are anticipated for the installation of the piping and utilities. Multi-purpose buildings may also be constructed at the site at a future date. Once the Project is operational, standby power would be provided by a 250 kilowatt (kW) diesel-powered emergency backup generator located adjacent to the proposed valve and pump station building.

This HRA conducts site-specific air dispersion modeling to determine whether health risks to offsite residents would exceed the SBCAPCD's health risk criteria for residences. The model includes construction sources and the proposed onsite generator source.

Cancer risk is expressed as the maximum number of new cases of cancer projected to occur in a population of one million people due to exposure to the cancer-causing substance, typically over a specific exposure duration, such as the high-end residency (95th percentile) of 30 years.[1] For example, a cancer risk of one in one million means that in a population of one million people, not more than one additional person would be expected to develop cancer as the result of the exposure to the substance causing that risk. Thirty years is the exposure duration scenario recommended by the SBCAPCD for residential receptors in Assembly Bill 2588 and the SBCAPCD's Modeling Guidelines for Health Risk Assessments.[1]

[1] Santa Barbara County Air Pollution Control District (SBCAPCD). 2025. Modeling Guidelines for Health Risk Assessment. November 2025. https://www.ourair.org/wp-content/uploads/apcd-15i.pdf (accessed November 2025)

An analysis using the Lakes Environmental American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) View model (version 13.0.0, MPI version 24142) and standalone health risk calculation spreadsheets determined the maximum exposed individual receptor (MEIR) from both construction and operation within 1,000 feet of the Project site. The MEIR would be exposed to an unmitigated, high end (95th percentile), 30-year excess cancer risk from construction of approximately 27.54 in one million, and a high end 30-year excess cancer risk from operation of approximately 0.15 in one million. Combined cancer risk at the MEIR would be approximately 27.57, which exceeds SBCAPCD's recommended cancer risk criteria of 10 excess cases of cancer in one million individuals (1.0E-05).[2] Implementation of Mitigation Measure AQ-1 would reduce construction-related cancer risk and combined cancer risk to 5.529 and 5.534, respectively. Therefore, cancer risk would be below SBCAPCD's recommended cancer risk criteria of 10 excess cases of cancer in one million individuals (1.0E-05).[2] Potential chronic (such as lung inflammation, immune suppression, and immune sensitization) health risks for on-site residential units were also determined to be within SBCAPCD health risk criteria.

1.3 Project Site and Description

The Project site encompasses the Vic Trace Reservoir parcel, 1633 La Coronilla Drive, and various water infrastructure replacements and improvements in the Alta Mesa neighborhood in the City of Santa Barbara, California.

The Vic Trace Reservoir parcel covers approximately 15 acres (14.726 acres) and is located on City-owned property at 740 Dolores Drive, Santa Barbara (Assessor's Parcel Number [APN] 035-033-031). The parcel contains existing water infrastructure facilities, existing City communication facilities, and La Coronilla Park. Access to the Vic Trace Reservoir parcel is from La Coronilla Drive between residences at 1617 and 1633 La Coronilla Drive via an existing 20-foot-wide easement through the 1617 La Coronilla Drive property.

A single-family residence located at 1633 La Coronilla Drive is owned by the City of Santa Barbara and is proposed to be used for temporary construction offices during the Project.

Underground water main pipeline (main) work is proposed within the public right-of-way (ROW) paved roadways near the Vic Trace Reservoir Parcel, including La Coronilla Drive, Dolores Drive, Ricardo Avenue, and La Vista Del Oceano. The site supports an existing reservoir that consists of a 10-million-gallon (MG), buried, hopper bottom, concrete-lined reservoir with associated piping. The reservoir extends approximately 20 feet in depth and has an overall footprint of approximately 380 feet by 250 feet. Associated outbuildings, including a valve and pump station building, are located northeast of the reservoir.

The proposed Project would replace the existing reservoir with a new reservoir structure in roughly the same location with the same 10 MG capacity, in addition to demolishing an existing valve building and constructing new valve and pump station building, retaining walls, a renewable energy system, paved access roads, piping to and from the new tanks, as well as the replacement and resizing of existing pipelines and utilities onsite and in the right-of-way. A single-family home at 1633 La Coronilla Drive would be used temporarily as construction offices during Project construction. Figure 1 shows the Project's regional location. Figure 2 shows the Project site location.

Figure 1 Regional Location

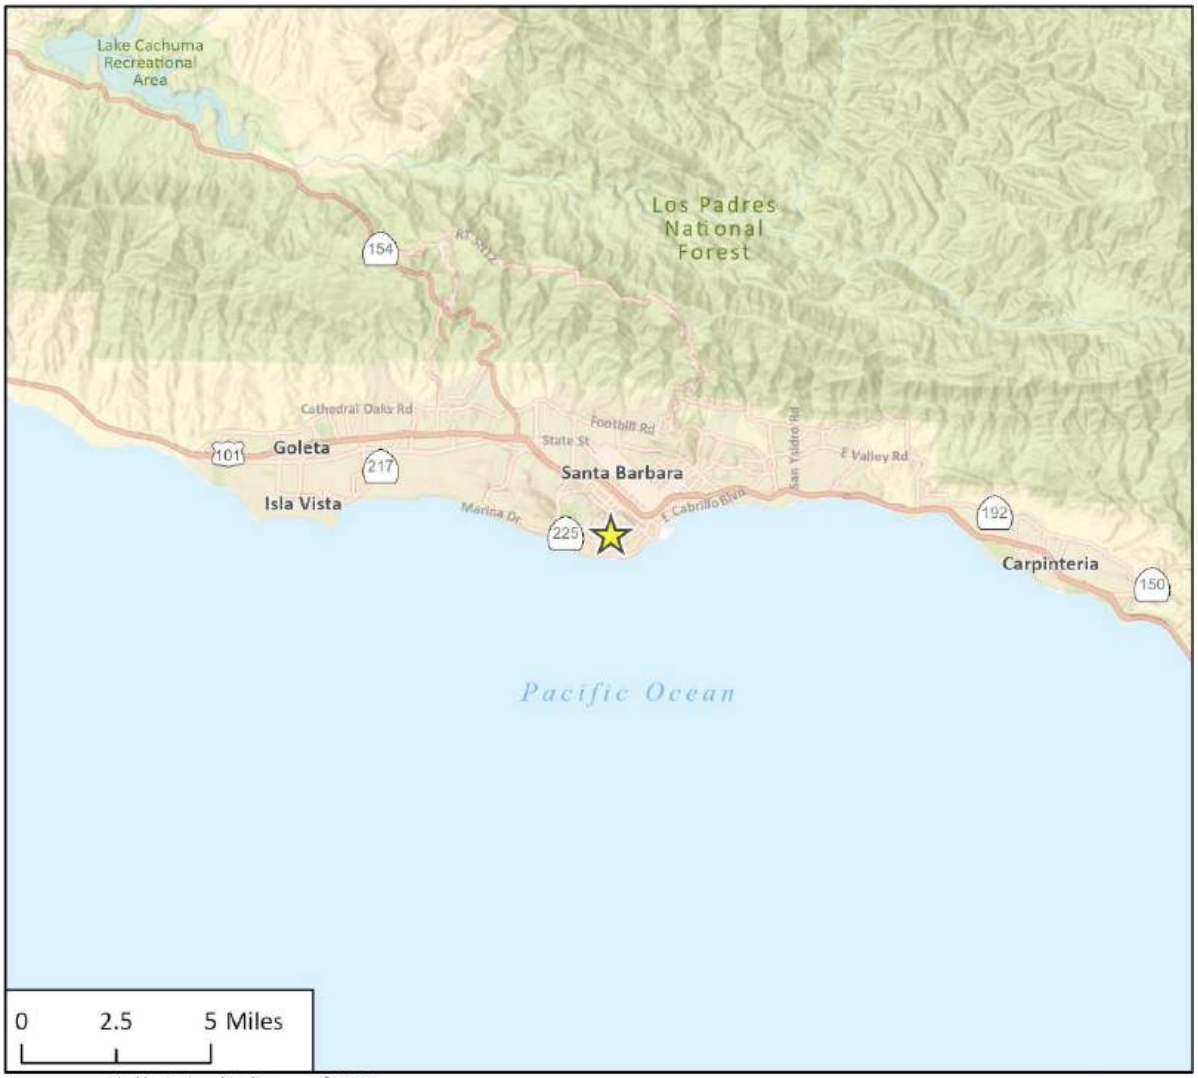

Figure 2 Project Location

2 Background

2.1 Local Climate and Meteorology

California is divided geographically into 15 air basins for managing the air resources of the state on a regional basis. Areas within each air basin are considered to share the same air masses and, therefore, are expected to have similar ambient air quality. The Project site is located in the South Central Coast Air Basin (SCCAB), which covers San Luis Obispo, Santa Barbara, and Ventura counties. SBCAPCD monitors and regulates local air quality in Santa Barbara County. The climate of the SCCAB is strongly influenced by its proximity to the Pacific Ocean and the location of the high-pressure cell in the northeastern Pacific. With a Mediterranean-type climate, Santa Barbara County is characterized by warm, dry summers and cool winters with occasional rainy periods.

The predominant wind direction in the vicinity of the Project site is from the west, and the average wind speed is approximately 5.7 miles per hour (mph). The maximum average daily temperature in the area is approximately 69 degrees Fahrenheit (°F), and the minimum average daily temperature is approximately 49°F. Total precipitation in the area averages approximately 17 inches annually.[3]

2.2 Toxic Air Contaminants

A TAC is an air pollutant that may cause or contribute to an increase in mortality or serious illness or which may pose a present or potential hazard to human health. TACs may result in long-term health effects such as cancer, birth defects, neurological damage, asthma, or genetic damage, or short-term acute effects such as eye watering, respiratory irritation, runny nose, throat pain, and headaches. TACs are considered either carcinogenic or non-carcinogenic based on the nature of the health effects associated with exposure. For carcinogenic TACs, potential health impacts are evaluated in terms of overall relative risk expressed as excess cancer cases per one million exposed individuals. Non-carcinogenic TACs differ in that there is generally assumed to be a safe level of exposure below which no negative health impact is believed to occur. These levels are determined on a pollutant-by-pollutant basis.

Diesel Particulate Matter

Fine particulates are generally associated with combustion processes and form in the atmosphere as a secondary pollutant through chemical reactions. PM_{10} (particulate matter measuring no more than 10 microns in diameter) is a by-product of fuel combustion and wind erosion of soil and unpaved roads, and it is directly emitted into the atmosphere through these processes. Chemical reactions in the atmosphere also create PM_{10}. Fine particulate matter poses a serious health threat to all groups, but particularly to the elderly, children, and those with respiratory problems. More than half of the fine particulate matter inhaled into the lungs remains there, which can cause permanent lung damage. These materials can damage health by interfering with the body's mechanisms for clearing the respiratory tract or by acting as carriers of an adsorbed toxic substance.

[3] Iowa State University. 2025. Iowa Environmental Mesonet: Santa Barbara Airport (SBA) Station. https://mesonet.agron.iastate.edu/sites/monthlysum.php?station=SBA&network=CA_ASOS (accessed December 2025).

Diesel engine fuel combustion forms an important fraction of the particulate matter emission inventory, as particulates in diesel emissions are very small and readily respirable. The particles have hundreds of chemicals adsorbed onto their surfaces, including many known or suspected mutagens and carcinogens. The Office of Environmental Health Hazard Assessment (OEHHA) reviewed and evaluated the potential for diesel exhaust to affect human health, and the associated scientific uncertainties.[4] Based on the available scientific evidence, it was determined that a level of diesel PM exposure, below which no carcinogenic effects are anticipated, has not been identified. The Scientific Review Panel that approved the OEHHA report determined that, based on studies to date, 3×10^{-4} micrograms per cubic meter ($\mu g/m^3$) is a reasonable estimate of the unit risk for diesel PM. This means that a person exposed to a diesel PM concentration of 1 $\mu g/m^3$ continuously over the course of a lifetime has a 3 in 10,000 chance (or 300 in one million chance) of contracting cancer due to this exposure. According to SBCAPCD, the estimated background cancer risk in some areas of Santa Barbara County are; 524 cancer cases per million in Downtown Santa Barbara; 98 cancer cases per million in Santa Maria; 47 cancer cases per million in Gaviota; and 40 cancer cased in Lompoc.[5]

DPM has a significant impact on California's population. It is estimated that about 70 percent of total known cancer risk related to air toxics in California is attributable to DPM. Based on 2012 estimates of statewide exposure, DPM is estimated to increase statewide cancer risk by 520 cancers per million residents exposed over a lifetime.[6]

2.3 Air Quality Regulation

Federal and state governments have established ambient air quality standards for the protection of public health. USEPA is the federal agency designated to administer air quality regulation, while the CARB is the state equivalent in the California Environmental Protection Agency (CalEPA). County-level Air Quality Management Districts (AQMDs) provide local management of air quality. The CARB has established air quality standards and is responsible for the control of mobile emission sources, while the local AQMDs are responsible for enforcing standards and regulating stationary sources. SBCAPCD is the designated air quality control agency in Santa Barbara County.

Toxic Air Contaminants

In 1983, the California Legislature enacted a program to identify the health effects of TACs and to reduce exposure to these contaminants to protect the public health (Assembly Bill [AB] 1807: Health and Safety Code Sections 39650–39674). The Legislature established a two-step process to address the potential health effects from TACs. The first step is the risk assessment (or identification) phase. The second step is the risk management (or control) phase of the process.

The California Air Toxics Program establishes the process for the identification and control of TACs and includes provisions to make the public aware of significant toxic exposures and for reducing risk. Additionally, the Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, 1987, Connelly Bill) was enacted in 1987 and requires stationary sources to report the types and quantities of certain substances routinely released into the air. The goals of the Air Toxics "Hot Spots" Act are to

[4] California Air Resources Board (CARB). 1998. *Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant" Part A, Exposure Assessment*. As approved by the Scientific Review Panel. https://ww2.arb.ca.gov/sites/default/files/classic//toxics/dieseltac/part_a.pdf.
[5] Santa Barbara County Air Pollution Control District. 2025b. Significant Risk Facilities. 2025. https://www.ourair.org/significant-risk-facilities/#:~:text=Among%20the%20largest%20contributors%20of,Requirements%20of%20Significant%20Risk%20Facilities (accessed December 2025)
[6] California Air Resources Board (CARB). 2025. Overview: Diesel Exhaust & Health. https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health. (accessed December 2025).

collect emission data, identify facilities having localized impacts, ascertain health risks, notify nearby residents of significant risks, and reduce those significant risks to acceptable levels. The Children's Environmental Health Protection Act, California Senate Bill 25 (Chapter 731, Escutia, Statutes of 1999), focuses on children's exposure to air pollutants. The act requires CARB to review its air quality standards from a children's health perspective, evaluate the statewide air quality monitoring network, and develop any additional air toxic control measures needed to protect children's health.

SBCAPCD regulates TAC emissions in the Santa Barbara County. The SBCAPCD air toxics program implements state and federal regulations regarding air toxics from stationary sources of air pollution. SCBACPD Rule 808, *New Source Review for Major Sources of Hazardous Air Pollutants,* evaluates health risk associated with new or modified facilities during the permit process when issuing new Authority to Construct permits. The goal for the District's new source review health risk program is to prevent a new or modified facility from creating a significant risk to the community.

Passage of Proposition 65 (encoded in California Health and Safety Code Section 25249.6) in 1986 prohibits a person in the course of doing business from knowingly and intentionally exposing any individual to a chemical that has been listed as known to the state to cause cancer or reproductive toxicity without first giving clear and reasonable warning. For a chemical that is listed as a carcinogen, the "no significant risk" level under Proposition 65 is defined as the level that is calculated to result in not more than one excess case of cancer in 100,000 individuals (1.0E-05). The SBCAPCD recommends the use of this risk level (also reportable as 10 in one million) as the significance threshold for toxic air contaminants.[2]

The Air Toxic "Hot Spots" Information and Assessment Act of 1987 (AB 2588) seeks to identify and evaluate risk from air toxics sources but does not directly regulate air toxics emissions. Under AB2588, TAC emissions from individual facilities are quantified and prioritized. "High priority" facilities are required to perform a health risk assessment and, if specific thresholds are violated, are required to communicate the results to the public in the form of notices and public meetings. Although TACs and $PM_{2.5}$ tend to be localized and are found in relatively low concentrations in ambient air, exposure to low concentrations over long periods can result in increased risk of cancer and/or adverse health effects in local communities.

2.4 Sensitive Receptors

CARB and OEHHA have identified the following groups of individuals as the most likely to be affected by air pollution: the elderly over 65, children under 14, infants (including in utero in the third trimester of pregnancy), and persons with cardiovascular and chronic respiratory diseases such as asthma, emphysema, and bronchitis.[7,8] Some land uses considered more sensitive to air pollution than others due to the types of population groups present or activities involved are referred to as sensitive receptors. Examples of these sensitive receptors are residences, schools/daycare centers, and hospitals. The Project site is located in the Alta Mesa neighborhood in the City of Santa Barbara. As shown in Figure 2, residences exist adjacent to the Project site boundary and along the Project alignment for offsite improvements.

3 Impact Analysis

3.1 Methodology

3.1.1 Air Dispersion Modeling

Dispersion modeling was performed using the U.S. EPA-approved *American Meteorological Society/Environmental Protection Agency Regulatory Model* (AERMOD) with meteorological data from the representative SBCAPCD monitoring station at 700 East Canon Perdido Street located in Santa Barbara. The Santa Barbara meteorological station is the nearest representative station with available data and is approximately two miles east of the Project site. Vehicle exhaust emissions sources for the Project were located on the Project site corresponding to the areas of construction activity. Construction activities, including the offsite pipeline alignments, were modeled as line volume sources[9] in AERMOD with an assumed release height of 3.4 meters, corresponding to the approximate height of heavy-duty off-road equipment mufflers from which exhaust emissions would be released.[1] Line volume sources were used to represent the haul route to U.S. Highway 101.

The operational emergency generator was modeled as a point source in AERMOD, with release parameters (including stack height, exit temperature, and flow rate) based on manufacturer's specifications. On-site buildings near the generator were evaluated for downwash effects on the modeled point source. AERMOD's building downwash algorithms account for the plume dispersion effects of the aerodynamic wakes and eddies produced by buildings and structures. Modeled buildings include the proposed pump station and valve buildings, in addition to the above-ground hydropneumatic fluid tank. Generator specifications are included as Appendix C.

Construction emissions would not be generated during nighttime hours; therefore, the dispersion modeling allocates the emissions during active construction hours, Monday to Friday from 7:00 a.m. to 5:00 p.m. Operational emissions, which would occur during generator maintenance and testing, were modeled during the hours of Monday to Friday from 9:00 a.m. to 5:00 p.m. Consistent with SBCAPCD guidance, a flagpole height of 1.5 meters was used for all receptors.

Health Risk Modeling

Health risk impacts were assessed using health risk calculation methodology consistent with the 2015 OEHHA Guidance. This health risk assessment addresses construction and operational DPM emissions and the effects on nearby sensitive uses (residential).

Health impacts were evaluated using a dose-response assessment, which describes the relationship between the level of exposure to a substance (i.e., the dose) and the incidence or occurrence of injury (i.e., the response). To determine the total dose to off-site sensitive receptors, the applicable pathways of exposure were identified. The applicable exposure pathways (e.g., inhalation) were identified for the emitted substances, and the receptor locations were identified. The applicable exposure pathways determine the exposure algorithms that are used to estimate dose. After the exposure pathways were identified, the applicable fate and transport algorithms were used to estimate concentrations in the applicable exposure media (e.g., air) and the exposure algorithms were used to determine the substance-specific dose. In accordance with the OEHHA Guidance, the

[9] A series of volume sources with a plume height and width along a line segment based on vehicle height and roadway width.

inhalation pathway was evaluated for construction-related and operational-related DPM. For the inhalation pathway, the dose is directly proportional to the breathing rate. As a conservative (i.e., health protective) approach, maximum breathing rates were used in this analysis.

Once dose was calculated, cancer risk was calculated by accounting for cancer potency of the specific pollutant, age sensitivity, exposure duration, averaging time for lifetime cancer risk, and fraction of time spent at home (sensitive receptor). The cancer potency factor (CPF) is specific for each pollutant and is determined through peer-reviewed scientific studies. For example, the Scientific Review Panel recommends a CPF for DPM of 3.0×10^{-4} $(\mu g/m^3)^{-1}$ and a slope factor of 1.1 $(ppm\text{-}day)^{-1}$.[10] The ASFs account for greater susceptibility in early life as compared to adult exposure, starting from the third trimester of pregnancy to 16 years. The fraction of time at home (FAH) takes into account the time actually residing at the sensitive receptor location for various age groups. For example, newborns are expected to reside at home for longer periods of time compared to school-age children, and the elderly (retirees) are expected to spend more time at home compared to people of working age. FAH consistent with OEHHA guidelines were used for the analysis.

Each age group has different exposure parameters which require cancer risk to be calculated separately for each age group. The estimation of cancer risk uses the following algorithms:

Risk = Dose inhalation × Inhalation CPF × ASF (Equation 1)

Where:

Dose inhalation = CAIR × DBR × A × EF × ED × FAH/AT (Equation 2)

Inhalation CPF = inhalation cancer potency factor

ASF = age-sensitivity factor

Where:

CAIR = concentration of compound in air in micrograms per cubic meter (µg/m3)

DBR = breathing rate in liter per kilogram of body weight per day (L/kg-body weighty/day)

A = inhalation absorption factor (1 for DPM)

EF = exposure frequency in days per year (day/year)

ED = exposure duration in years (year)

FAH = fraction of time at home

AT = averaging time period over which exposure is averaged in days (day)

The OEHHA recommended values for the equations and daily breathing rates (DBR) described above were used in the HRA. Specific modeling details are included in Appendix A.

The incremental increase in cancer risk is the result of multiplying the dose by the pollutant-specific CPF values. Cancer risk is calculated by multiplying the inhalation dose by the inhalation CPF to yield the potential inhalation excess cancer risk. Cancer risk was evaluated for residences in the surrounding area. Risk for all receptors is included as part of Appendix A. The modeling output is included as Appendix B.

In addition to analyzing health risk during construction and operation, the analysis also considered combined health risk. Construction activity would occur over approximately 33 months; therefore, the combined health risk analysis assumed construction would begin at 3rd trimester age group and

[10] CPF and slope factors are built into the HARP2 model used for quantifying risk.

would be completed during the first 18 months of the 0-2 years age group, based on OEHHA guidance. In order to provide a more conservative analysis, the operational HRA also began the health risk evaluation at the 3rd trimester age group, because of the greater sensitivity to carcinogens during early-in-life exposure. Because this approach essentially assumes concurrent (instead of consecutive) construction and operation for the 3rd trimester and 0-2 age groups, the combined health risk assessment increases the health risk for these age groups which results in a conservative analysis compared to assuming consecutive construction and operation.

Non-Cancer Risk

Non-cancer chronic impacts affect specific target organ systems (also called toxicological endpoints), such as the eye, nervous system, reproductive system, and respiratory system. Non-cancer chronic impacts were assessed based on the hazard index (HI). The evaluation of chronic impacts is based on the maximum annual emissions over a 12-month period of construction activity. The chronic HI is calculated by dividing the maximum modeled annual average concentration at the maximum impacted sensitive receptor by the recommended exposure limit (REL). The REL is the concentration at or below which no adverse health effects are anticipated.

For example, OEHHA has recommended an ambient concentration of 5 µg/m^3 as the chronic inhalation REL for DPM exhaust. Therefore, a sensitive receptor exposed to an annual average DPM concentration of 5 µg/m^3 or less would not result in a chronic impact. The chronic health impact with the maximum HI for the same target organ system is used for health risk determination.

3.2 Significance Thresholds

SBCAPCD recommends the use of this risk level (also reportable as 10 in one million cancer risk) as the significance threshold for toxic air contaminants.[2] SBCAPCD also recommends that the non-carcinogenic hazards of toxic air contaminants should not exceed a hazard index (the summation of the hazard quotients for all chemicals to which an individual would be exposed) of 1.0 for either chronic or acute effects.[2] These recommended thresholds are applied herein.

3.3 Results

3.3.1 Air Dispersion Modeling and Risk Analysis Results

In order to accurately characterize sensitive receptor locations surrounding the Project site and offsite components, 453 receptors points using 25-meter spacing were used in AERMOD. Sensitive receptors identified for modeling were placed at the location of nearby sensitive land uses, which includes residences within 1,000 feet from the Project site, along offsite pipeline alignments, and along the trucking route.

Cancer risk was determined for a 30-year residency scenario at all receptor locations. Chronic risk was also determined based on the maximum annual exposure. Risk levels for the MEIR are shown in Table 1. Refer to Appendix A for more detailed accounting of total health risks for all receptors of concern.

Construction Risk

The maximum unmitigated risk from construction of the proposed Project was identified for all sensitive receptors within 1,000 feet of the Project site boundary and alignment as detailed in

Appendix A. The maximum off-site residential cancer risk from construction would be 27.54 in one million at one of the single-family homes south of the Project site along La Vista del Oceano. In addition, the chronic risk at the maximum off-site receptor would be exposed to a hazard index of 0.026. Project construction would exceed the SBCAPCD's threshold of 10 in one million for cancer risk. Project construction would not exceed the hazard index of 1 for chronic risk. Given that the cancer risk would exceed SBCAPCD thresholds, Project construction would potentially expose sensitive receptors to substantial TAC concentrations, and this impact would be potentially significant without mitigation.

Operation and Combined Risk

The maximum unmitigated risk from operation of the proposed generator was identified for all sensitive receptors within 1,000 feet of the generator source. The maximum off-site residential cancer risk from generator operation would be 0.15 in one million at one of the single-family homes northwest of the Project site along Dolores Drive. In addition, the chronic risk at the maximum off-site receptor would be exposed to a hazard index of <0.001.

Combined risk from construction and operation was identified for all aforementioned sensitive receptors. As shown in Table 1, the MEIR would be exposed to a high end (95th percentile), 30-year excess cancer risk of approximately 27.57 in one million, which would exceed the threshold of ten excess cases of cancer in one million individuals (1.0E-05).

Potential chronic health risk is approximately 0.006, which does not exceed the hazard index threshold of 1.0[11]. Therefore, sensitive receptors near the Project site would potentially experience cancer or chronic health risk exceeding the health risk thresholds. Impacts would be potentially significant without mitigation.

Table 1 Potential Health Risks at the MEIR - Unmitigated

	Maximum Exposed Individual Resident (MEIR)
Cancer Risk	
Construction Cancer Risk	27.54 in one million
Operation Cancer Risk	0.15 in one million
Combined Cancer Risk[1]	27.57 in one million
Threshold	10 in one million
Threshold Exceeded?	**Yes**
Chronic Risk[2]	
Construction Chronic Hazard Index	0.026
Operation Chronic Hazard Index	<0.001
Threshold	1.0
Threshold Exceeded?	**No**

[1] Maximum Exposed Residential Receptor is on La Vista del Oceano along the southern boundary of the Project site.

See Appendix A for risk calculation results and Appendix B for modeling outputs.

[11] It is the sum of hazard quotients for substances that affect the same target organ or organ system. As with the hazard quotient, aggregate exposures below 1.0 derived using target organ specific hazard quotients likely will not result in adverse non-cancer health effects over a lifetime of exposure.

Mitigation Measures

Implementation of Mitigation Measure AQ-1 is required.

AQ-1 Tier 4 Construction Equipment

All mobile off-road equipment (wheeled or tracked) greater than 50 horsepower used during construction activities shall meet the USEPA's Tier 4 final standards. Tier 4 certification can be for the original equipment or equipment that is retrofitted to meet the Tier 4 Final standards. In the event where Tier 4 Final equipment is not viable at the time of the award of the construction contract, the equipment shall meet Tier 3 standards at a minimum. A copy of each equipment's certified tier specification or model year specification shall be available upon request at the time of mobilization of each piece of equipment. The City Environmental Analyst or designee shall ensure these requirements are incorporated into construction contract documents.

Significance After Mitigation

Mitigation Measure AQ-1 would require the use of off-road diesel-powered construction equipment that meets or exceeds the most stringent and environmentally protective CARB and USEPA Tier 4 off-road emissions standards, or alternatively fueled equipment which would substantially reduce DPM emissions. Table 2 present the maximum estimated cancer risk and non-cancer chronic risk associated with Project construction and construction combined with operation at the maximum exposed off-site residential receptors. As shown therein, none of the estimated cancer or chronic risk numbers would exceed the SBCAPCD's threshold of 10 in one million for cancer risk or hazard index of 1 for chronic risk. Thus, with implementation of Mitigation Measure AQ-1, construction-related and combined health impacts would be reduced to a less than significant level. Therefore, the Project would not expose sensitive receptors to substantial pollutant concentrations, and impacts would be less than significant with mitigation incorporated.

Table 2 Potential Health Risks at the MEIR - Mitigated

	Maximum Exposed Individual Resident (MEIR)
Cancer Risk	
Construction Cancer Risk	5.53 in one million
Operation Cancer Risk	0.15 in one million

Unmitigated Results		
Scenario	Excess Cancer Risk (per million)	Chronic Health Risk[1]
Construction (Unmitigated)	27.54	0.026
Generator Only	0.15	0.000
Construction + Generator	27.57	0.026
SBCAPCD Significance Threshold	>10	>1
Threshold Exceeded?	No	No

$PM_{2.5}$ = particulate matter less than 2.5 microns in size; $\mu g/m^3$ = micrograms per cubic meter

[1] Noncancer health impacts are determined by dividing the airborne concentration at the receptor by the appropriate Reference Exposure Level (REL) for that substance. A REL is defined as the concentration at which no adverse noncancer health effects are anticipated. Because noncancer health impacts are assessed as the ratio of airborne concentration versus the REL, the resulting hazard index is unitless.

Vic Trace Reservoir Combined Construction + Operational Health Risk Assessment

Health Risk Assessment Risk Factors

Residential Risk	Abbreviation	UOM	3rd Trimester	0<2	2<16	16<30
Daily Breathing Rate (95th %'ile)	DBR	L/kg-day	361	1090	572	261
Fraction Of Time At Home	FAH	unitless	1	1	1	0.73
Exposure Frequency	EF	days/year	0.96	0.96	0.96	0.96
Age Sensitivity Factor	ASF	unitless	10	10	3	1
Inhalation Absorption Factor	A	unitless	1	1	1	1
Conversion Factor	CF_1	m^3/L	0.001	0.001	0.001	0.001
Conversion Factor	CF_2	$\mu g/m^3$	0.001	0.001	0.001	0.001
Cancer Potency Factor (diesel exhaust)	CPF	$mg/kg\text{-}day^{-1}$	1.1	1.1	1.1	1.1
Averaging Time (for residential exposure)	AT	years	70.00	70.00	70.00	70.00

Vic Trace Reservoir Construction Health Risk Assessment

Health Risk Assessment Results Summary

Unmitigated

Scenario	Excess Cancer Risk (per million)	Chronic Health Risk[1]
Residences	27.54	0.026
SBCAPCD Significance Threshold	>10	>1
Threshold Exceeded?	Yes	No

$PM_{2.5}$ = particulate matter less than 2.5 microns in size; $\mu g/m^3$ = micrograms per cubic meter

[1] Noncancer health impacts are determined by dividing the airborne concentration at the receptor by the appropriate Reference Exposure Level (REL) for that substance. A REL is defined as the concentration at which no adverse noncancer health effects are anticipated. Because noncancer health impacts are assessed as the ratio of airborne concentration versus the REL, the resulting hazard index is unitless.
