Generator Specification Sheet

Cat® D250 GC
Diesel Generator Sets

Standby : 60 Hz

Image shown may not reflect actual configuration

Engine Model	Cat® C9 In-line 6, 4-cycle Diesel
Bore x Stroke	112 mm x 149 mm (4.4 in x 5.9 in)
Displacement	8.8 L (538 in³)
Compression Ratio	16.3:1
Aspiration	Turbocharged Air-to-Air Aftercooled
Fuel Injection System	HEUI
Governor	Electronic ADEM™ A4 - G2 Class* capable

Model	Standby	Emission Strategy
D250 GC	250 ekW, 312.5 kVA	EPA Certified for Stationary Emergency Application

PACKAGE PERFORMANCE

Performance	Standby
Frequency	60 Hz

APPLICABLE CODES AND STANDARDS:

CSA C22.2 No 100-04, UL142, UL489, UL869, cUL/UL2200, NFPA 37, NFPA 70,NFPA 99,NFPA 110, IBC, IEC60034-1, ISO 3046, ISO 8528, NEMA MG 1-33.
Note: Codes may not be available in all model configurations. Please consult your local Cat Dealer representative for availability.

STANDBY: Output available with varying load for the duration of the interruption of the normal source power. Average power output is 70% of the standby power rating. Typical operation is 200 hours per year, with maximum expected usage of 500 hours per year.

RATINGS: Ratings are based on SAE J1349 standard conditions. These ratings also apply at ISO3046 standard conditions.

FUEL RATES: Based on fuel oil of 35º API [16º C (60º F)] gravity having an LHV of 42 780 kJ/kg (18,390 Btu/lb) when used at 29º C (85º F) and weighing 838.9 g/litre (7.001 lbs/U.S. gal.). Additional ratings may be available for specific customer requirements, contact your Caterpillar representative for details. For information regarding Low Sulfur fuel and Biodiesel capability, please consult your Cat dealer.

DEFINITIONS AND CONDITIONS

[1] For ambient and altitude capabilities consult your Cat dealer. Air flow restriction (system) is added to existing restriction from factory.

[2] Emissions data measurement procedures are consistent with those described in EPA CFR 40 Part 89, Subpart D & E and ISO8178-1 for measuring HC, CO, PM, NOx. Data shown is based on steady state operating conditions of 77° F, 28.42 in HG and number 2 diesel fuel with 35° API and LHV of 18,390 BTU/lb. The nominal emissions data shown is subject to instrumentation, measurement, facility and engine to engine variations. Emissions data is based on 100% load and thus cannot be used to compare to EPA regulations which use values based on a weighted cycle.

[3] UL 2200 Listed packages may have oversized generators with a different temperature rise and motor starting characteristics. Generator temperature rise is based on a 40° C ambient per NEMA MG1-32.

* Governing Class capability as per ISO8528-5.Consult your local Cat dealer for configuration and site specific transient performance classification.

D250 GC – D600 GC Sound Attenuated Enclosures

60 Hz

Features

Robust/Highly Corrosion Resistant Construction

- Factory installed on skid base or tanks base
- Environmentally friendly, polyester powder baked paint
- Enclosure constructed with 18-gauge steel
- Interior zinc plated fasteners
- Internally mounted exhaust silencing system
- Comply with ASCE /SEI 7 for Wind loads up to 100 mph
- Designed and tested to comply with UL 2200 Listed generator set package

Excellent Access

- Large cable entry area for installation ease.
- Accommodates side mounted single or multiple breakers.
- Two doors on both sides.
- Vertically hinged allow 180° opening rotation
- Radiator fill cover.

Security and Safety

- Lockable access doors which give full access to control panel and breaker.
- Cooling fan and battery charging alternator fully guarded.
- Fuel fill, oil fill and battery can only be reached via lockable access.
- Externally mounted emergency stop button (Optional).
- Designed for spreader bar lifting to ensure safety.
- Stub-up area is rodent proof.

Sound Attenuated Level 2

- Caterpillar white paint
- UL Listed integral fuel tank with 24 hours running time capacity (Optional).
- DC lighting package (Optional)

Enclosure Package Operating Characteristics

Executive Summary

The Vic Trace Reservoir Replacement Project (Project) is located within the Alta Mesa neighborhood in Santa Barbara and would replace the water infrastructure currently located onsite and implement various infrastructure improvements. The Project site encompasses the Vic Trace Reservoir parcel, 1633 La Coronilla Drive, and various infrastructure improvements in the Alta Mesa neighborhood.

The Study Area encompasses approximately 17 acres and includes the Vic Trace Reservoir parcel, 1633 La Coronilla Drive, La Coronilla Park, La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road. Within the Study Area, nine vegetation and land cover types are present: California Sagebrush Scrub, Coast Live Oak Woodland, Developed/Disturbed, Eucalyptus Groves, Iceplant Mats, Lemonade Berry Scrub, Landscape/Ornamental, Quailbush Scrub, and Wild Oats and Annual Brome Grassland. Out of these nine vegetation and land cover types, only Lemonade Berry Scrub is designated by the California Department of Fish and Wildlife (CDFW) as a sensitive vegetation community.

There are five special-status plant species with potential to occur within the Study Area: Douglas' fiddleneck (*Amsinckia douglasiana*), Miles' milk-vetch (*Astragalus didymocarpus* var. *milesianus*), Brewer's calandrinia (*Calandrinia breweri*), Catalina mariposa-lily (*Calochortus catalinae*), and Hubby's phacelia (*Phacelia hubbyi*). All five species have low potential to occur within the Study Area.

There are five special-status wildlife species with potential to occur within the Study Area: coastal whiptail (*Aspidoscelis tigris stejnegeri*), coast horned lizard (*Phrynosoma blainvillii*), coast patch-nosed snake (*Salvadora hexalepis virgultea*), white-tailed kite (*Elanus leucurus*), and western red bat (*Lasiurus frantzii*). The white-tailed kite has a moderate potential to occur within the Study Area, whereas the rest of the species have low potential to occur.

No potentially jurisdictional water resources or wildlife movement corridors are present within the Study Area.

Impacts to special-status plants and animals would be less than significant and would be further reduced through Mitigation Measures BIO-1 through BIO-6, which would establish a worker environmental training program for the Project, require preparation of Nesting Bird Management Plan, require special-status wildlife species surveys, require the presence of a biological monitor, require preparation of a Lemonade Berry Scrub Restoration Plan, and require preparation of a Tree Protection Plan.

This Biological Resources Assessment addresses requirements of the California Environmental Quality Act (CEQA) as well as relevant federal laws and requirements, and was prepared to support compliance with the CEQA-Plus environmental review process.

1 Introduction

This report documents the findings of a Biological Resource Assessment (BRA) conducted by Rincon Consultants, Inc. (Rincon) for the City of Santa Barbara's (City) Vic Trace Reservoir Replacement Project (Project). The Project is located within the city of Santa Barbara, California. This BRA documents existing site conditions via a desktop analysis and field survey and evaluates potential impacts to regulated biological resources based upon current Project plans. This BRA also describes existing biological conditions within an approximately 17-acre area (Study Area) that includes the Vic Trace Reservoir parcel improvements, underground water pipelines, and an underground Pressure Reducing Valve (PRV) station relocation.

The Project may seek federal funding, including through the Drinking Water State Revolving Fund (DWSRF), administered by the State Water Resources Control Board (SWRCB) on behalf of the United States Environmental Protection Agency (EPA). Therefore, it may also be subject to the National Environmental Policy Act (NEPA). This BRA was prepared to support compliance with CEQA and address relevant federal laws and requirements. The City of Santa Barbara is the lead agency for this project under CEQA.

1.1 Project Location

The Project site encompasses the Vic Trace Reservoir parcel, 1633 La Coronilla Drive, and various water infrastructure improvements in the Alta Mesa neighborhood in the City of Santa Barbara, California.

The Vic Trace Reservoir parcel covers approximately 15 acres (14.726 acres) and is located on City-owned property at 740 Dolores Drive, Santa Barbara (Assessor's Parcel Number [APN] 035-033-031). The parcel contains existing water infrastructure facilities, existing City communication facilities, and La Coronilla Park. Access to the Vic Trace Reservoir parcel is from La Coronilla Drive between residences at 1617 and 1633 La Coronilla Drive via an existing 20-foot-wide easement through the 1617 La Coronilla Drive property.

A single-family residence located at 1633 La Coronilla Drive is owned by the City of Santa Barbara and is proposed to be used for temporary construction offices during the Project.

Underground water main pipeline (main) work is proposed within the public right-of-way (ROW) paved roadways near the Vic Trace Reservoir Parcel, including La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road. For a tabular summary of the Project components, refer to Table 1.

Table 1 Location of Project Components

Project Components	Location
Vic Trace Reservoir Parcel Improvements	
Vic Trace Reservoir Parcel Improvements and Reservoir Replacement	740 Dolores Drive, Santa Barbara (Assessor's Parcel Number 035-033-031)
Offsite Improvements	
Relocated La Coronilla Transmission Main	Public ROW in roadway from intersection of Meigs Road westward to Vic Trace Reservoir driveway entrance
Temporary construction offices	1633 La Coronilla Drive, Santa Barbara (APN 035-033-007)
Replaced Vic Trace Outlet Main	Public ROW in roadway from Vic Trace Reservoir driveway entrance west along La Coronilla Drive, then south along Dolore Drive to the intersection of Meigs Road and Dolores Drive, then south on Meigs Road to Red Rose Way
Replaced Dolores Drive Main	Public ROW in road from intersection of La Coronilla Drive and Dolores Drive southwest towards Meigs Road
New Ricardo Avenue Main	Public ROW in roadway from the intersection of Dolores Drive and Ricardo Avenue westward towards La Vista Del Oceano
Entry/Exit Pits for La Vista Del Oceano Main Lining	Public ROW in roadway – temporary entry pit located in roadway at 652 Ricardo Avenue, temporary exit pit located in roadway west of 1528 La Vista Del Oceano
Existing PRV Station (to be abandoned)	Public ROW in roadway west of 1521 La Vista Del Oceano
Proposed PRV Station (to be constructed)	Public ROW east of intersection of Dolores Drive and Meigs Road on Dolores Drive between curb and private property at 1740 Cliff Drive

ROW = right of way
Main = water pipeline
PRV = pressure regulating valve

1.2 Project Description

Originally constructed in 1956, Vic Trace Reservoir is the City of Santa Barbara's largest water storage reservoir. It serves as a vital component of the City's water distribution system, serving nearly 60,000 people or approximately 70 percent of Santa Barbara's population.

In 2021, the City's Water Distribution Infrastructure Plan developed recommendations to address the City's water distribution and supply needs through 2050. The Water Distribution Infrastructure Plan recommended replacement of Vic Trace Reservoir due to its age, increasing repair needs, and importance to the City's overall water storage portfolio. Related offsite water infrastructure improvements in the Alta Mesa neighborhood were also identified to replace aging infrastructure, improve water system hydraulics, and address worker safety issues (safe facility ingress and egress).

The proposed Project includes the following main elements:

- **Vic Trace Reservoir Parcel Improvements**: Replacement of the existing 10 million gallon Vic Trace Reservoir with two 5 million gallon reservoirs at the same site, re-abandonment of the abandoned oil well, building replacements, earthwork, and site improvements on the parcel, including possible renewable energy generation and storage.
- **Offsite Improvements**:
  - **Underground Water Mains:** Replacements, repairs, abandonments, and relocations of aging water mains in neighborhood areas near the Vic Trace Reservoir parcel.
  - **Underground PRV Station Relocation**: Relocation of the reservoir's downstream PRV station to an improved location with safer entry.
  - **Construction Offices:** Use of a City-owned single-family residential property for temporary construction offices for safer and more accessible neighbor engagement with Project personnel.

1.3 Regulatory Summary

Regulated or sensitive resources studied and analyzed herein include special-status plant and animal species, nesting birds and raptors, sensitive plant communities, jurisdictional waters and wetlands, wildlife movement, and locally protected resources, such as protected trees. Regulatory authority over biological resources is shared by federal, State, and local authorities. Primary authority for regulation of general biological resources typically lies in the local land use control and planning authority, in this instance, the City of Santa Barbara's Community Development Department.

1.3.1 Definition of Special-Status Species

For the purposes of this report, special-status species include:

- Species listed as threatened or endangered under the federal Endangered Species Act (ESA);
- Species listed as candidate, threatened, endangered, or rare by CDFW under the California Endangered Species Act (CESA) or Native Plant Protection Act;
- Plant species occurring on lists 1 and 2 of the CDFW and California Native Plant Society (CNPS) California Rare Plant Rank (CRPR) system;
- Wildlife species designated as Fully Protected (FP) or Species of Special Concern (SSC) by the CDFW;

- Plant species designated as Locally Rare (LR) by the Santa Barbara Botanic Garden (SBBG); and
- Species designated as sensitive or protected by the City and/or otherwise protected through ordinance or local policy.

1.3.2 Environmental Statutes

For the purpose of this report, analysis of potential impacts to biological resources was guided by the following statutes (Appendix A):

- ESA
- Federal Clean Water Act (CWA)
- Migratory Bird Treaty Act (MBTA)
- The Bald and Golden Eagle Protection Act
- Coastal Zone Management Act
- Floodplain Management – Executive Order 11988
- Protection of Wetlands – Executive Order 11990
- Wild and Scenic Rivers Act
- Magnuson-Stevens Fishery Conservation and Management Act
- Fish and Wildlife Coordination Act
- Coastal Barriers Resources Act
- Rivers and Harbors Act
- CESA
- CEQA
- California Fish and Game Code (CFGC)
- Porter-Cologne Water Quality Control Act
- City of Santa Barbara General Plan (2011)
- City of Santa Barbara Municipal Code (2025)
- SBBG Rare Plants of Santa Barbara County (Wilken 2018)

1.3.3 Guidelines for Determining CEQA Significance

The following threshold criteria, as defined by the *CEQA Guidelines* Appendix G Initial Study Checklist, are used to evaluate potential environmental effects. Based on these criteria, the proposed Project would have a significant effect on biological resources if it would:

a) Have substantial adverse effects, either directly or through habitat modifications, on any species identified as a candidate, sensitive or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.

c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan

2 Methodology

2.1 Study Area

Biologists conducted the survey within the Study Area, defined for this Project as the approximately 17 acres where the proposed construction will occur (Figure 2). The Study Area includes the Vic Trace Reservoir parcel and the location of offsite improvements within the paved roadways near the Vic Trace Reservoir parcel, including La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road.

2.2 Literature Review

Rincon conducted a literature review to characterize the nature and extent of biological resources on and adjacent to the Study Area. The literature review included an evaluation of current and historical aerial photographs of the site (Google Earth), regional and site-specific topographic maps, and climatic data.

Queries of the U.S. Fish and Wildlife Service (USFWS) Information for Planning and Consultation system (IPaC; UFWS 2025a), CDFW California Natural Diversity Database (CNDDB; 2025a), and CNPS online Inventory of Rare and Endangered Plants of California (2020) were conducted to obtain comprehensive information regarding State and federally listed species and other special-status species considered to have potential to occur within the Santa Barbara, California USGS 7.5-minute topographic quadrangle and the surrounding five quadrangles (*Goleta, San Marcos Pass, Little Pine Mountain, Hildreth Peak,* and *Carpinteria*). The results of database queries and lists of special-status species were reviewed by Rincon's regional biological experts for accuracy and completeness. The final list of special-status biological resources (species and sensitive natural communities) was evaluated based on documented occurrences within the nine-quadrangle search area and biologists' expert opinions on species known to occur in the region. The evaluation results and justification were compiled into a table (Appendix D).

The following resources were reviewed for additional information on existing conditions relating to biological resources within the Study Area:

- United States Department of Agriculture (USDA), Natural Resources Conservation Service (NRCS) Web Soil Survey (2025)
- USFWS Critical Habitat Portal (2025)
- CDFW Biogeographic Information and Observation System (CDFW 2025a)
- CDFW Special Vascular Plants, Bryophytes, and Lichens List (2025c)
- CDFW Special Animals List (2025d)
- USFWS National Wetlands Inventory (NWI; USFWS 2025a)
- United States Geological Survey (USGS) National Hydrography Dataset (NHD; USGS 2025)

The vegetation community characterizations for this analysis were based on the classification systems presented in *A Manual of California Vegetation, Second Edition* (MCV2; Sawyer et al. 2009).

The potential for wildlife movement corridors was evaluated based on the California Essential Habitat Connectivity Project commissioned by the California Department of Transportation and CDFW (Spencer et al. 2010).

2.3 Field Reconnaissance Survey

A reconnaissance-level field survey and delineation (field survey) was conducted between 0900 and 1400 hours on July 13, 2023 by Rincon Biologists Melissa Pechter and Casey Clark. An additional site visit for the entry and exit pits for La Vista Del Oceano Main Lining was conducted between 1320 and 1340 hours on July 30, 2025 by Rincon Biologist Elizabeth Shoemaker. The field surveys characterized the existing conditions within the Study Area and investigated the presence, or potential presence, of regulated biological resources including special-status plant and wildlife species, sensitive plant communities, jurisdictional waters and wetlands, wildlife migration and movement corridors, and nesting bird habitat. Aquatic and biological resources, where observed, were photographed and recorded using a submeter-accurate global positioning system (GPS) unit. Weather conditions during the survey included temperatures ranging between 65 to 75 degrees Fahrenheit, winds between 0 to 10 miles per hour, and sunny skies.

3 Existing Conditions

3.1 Vic Trace Reservoir Parcel

The Vic Trace Reservoir parcel (site) covers approximately 15 acres and contains Lavigia Hill. The peak of Lavigia Hill sits approximately 460 feet above sea level, 50 feet higher than the site entrance at La Coronilla Drive.

The parcel hosts existing City-owned infrastructure facilities, including:

- **Vic Trace Reservoir:** Vic Trace Reservoir is a partially buried drinking water storage reservoir with a storage capacity of 10 million gallons. Located in the center of the parcel at the top of Lavigia Hill, the reservoir was constructed in 1956 of rectangular concrete and measures 248 feet in width, 380 feet in length, and with a side water depth of 20 feet. The concrete-lined reservoir sits primarily below ground, surrounded by a raised concrete foundation. Above ground, the reservoir is covered by a low-pitched side gabled roof sheathed in corrugated metal siding on a low concrete wall. The existing reservoir extends approximately 4 feet above ground level and is not visible from adjacent public roads.
- **Valve Building:** The Valve Building is located at the northern entrance to the Vic Trace Reservoir parcel, adjacent to the driveway/easement from La Coronilla Drive. The structure was built in 1956 and is 25 feet long, 20 feet wide, and 14 feet tall. It is constructed of poured concrete and capped by a flat roof. The Valve Building contains control valves for the reservoir, the La Coronilla Pump Station, post-water disinfection (chlorine) storage and feed equipment, and an adjacent metering vault and hydropneumatic tank.
- **Telecommunications Facilities:** City radio equipment and a communication facility are situated on the parcel, which is also leased by AT&T and Santa Barbara Wireless Foundation (previously known as the Santa Barbara Amateur Radio Club) , both vacating the site by 2026. A City-owned Information Technology (IT) Building 30 feet long by 27 feet wide houses a generator, with a connected 250-gallon diesel fuel tank outside of the building. A second mobile structure is owned by the Santa Barbara Wireless Foundation and will be removed by October 31, 2025.
- **Abandoned Oil Well:** An existing, previously abandoned oil well (drilled and abandoned in 1935) is located in the vicinity of the north-east corner of the existing Vic Trace Reservoir. The oil well was drilled to a depth of 1,555 feet. The oil well did not produce any oil and was abandoned per State of California Division of Oil and Gas abandonment procedures in the same year.

One ingress and egress driveway provides site access to the Vic Trace Reservoir parcel. A one-lane, 20-foot wide paved road runs from La Coronilla Drive southward up Lavigia Hill to the existing reservoir and telecommunication facilities. An unpaved approximately 8-foot wide access road continues intermittently around the perimeter of the reservoir. A combination of chain link and shepherds hook fencing (5-8 ft tall) surround the perimeter of the property (with the exception of La Coronilla Park). A second internal chain link fence (7 ft tall) encloses the reservoir roof area. A locked, chain link security gate is located at the property entrance.

The western portion of the Vic Trace Reservoir parcel also contains La Coronilla Park, an undeveloped, vegetated neighborhood park situated between 726 and 812 Dolores Drive.

Other than the developments described above, the remainder of the Vic Trace Reservoir parcel is generally undeveloped with vegetation communities such as grassland, coast live oak woodland, eucalyptus grove, sagebrush, and ice plant mats. The parcel is regularly mowed and vegetation is maintained for fire suppression. Unauthorized pedestrian gates have been installed by private property owners along the perimeter fencing.

3.2 Offsite Improvements

Offsite of the Vic Trace Reservoir parcel, the existing pipelines and the existing La Vista Del Oceano PRV station are located underground in paved roadways in the Alta Mesa residential neighborhood surrounding the Vic Trace Reservoir site. PRV stations convey and regulate water between zones of different water pressure across the City. The proposed PRV station relocation site is located on undeveloped land in public ROW, in between a paved curb, sidewalk, and a fenced private property.

3.2.1 Physical Characteristics

Topography and Geography

The weather in Santa Barbara is typical of a Mediterranean climate. Summers are warm and dry, while winters are cool and wet with most of the precipitation falling between November and March. The Study Area is located within the South Coast geographic subregion of California (Baldwin et al. 2012), approximately 0.6 miles north of the Pacific Ocean at an elevation of 210 to 475 feet above mean sea level. The Study Area is located on the moderately sloped foothills of the Santa Ynez Mountains, with the Vic Trace Reservoir located at its highest point. It is surrounded primarily by urban/developed land to the east, south, and west and is bordered by undeveloped natural woodland habitat on a steep north aspect slope to the north. The Study Area is relatively buffered from natural habitats by local development of residences, streets, and other infrastructure. The Vic Trace Reservoir parcel is regularly mowed and vegetation is maintained for fire suppression, which further limits the establishment of natural habitats within that area.

Hydrology

The Study Area is located within the Mission Creek-Frontal Santa Barbara Channel Subwatershed (Hydrologic Unit Code [HUC] 12-180600130203; USGS 2025). No aquatic features were observed within the Study Area during the field survey. In addition, no streams or wetlands are documented by the NWI or the NHD within the Study Area. Sheet flow created through precipitation events in the Study Area drains generally outward and downslope from the constructed reservoir, which is located at the highest elevation point in the Study Area. Precipitation runoff flows through various culverts serving residential neighborhoods and roadways, which all drain into the Pacific Ocean to the south of the Study Area.

Soils

The USDA, NRCS Web Soil Survey depicts four soil map units within the Study Area: Arnold Loamy Sand, 15 to 30 Percent Slopes, Eroded, Major Land Resource Area 20 (AgE2; MLRA), Ayar Clay, 15 to 30 Percent Slopes, Eroded (AhE2), Ayar Clay, 50 to 75 Percent Slopes (AhG), and Concepcion Fine Sandy Loam, 2 to 9 Percent Slopes (CgC). The site-specific soil observations from the field survey

were generally consistent with those mapped by the Web Soil Survey.[1] None of the soil map units within the Study Area are listed as hydric (USDA, NRCS 2025). Figure 4 depicts the location of the soil map units within the Study Area.

- **Arnold Loamy Sand, 15 to 30 Percent Slopes, Eroded, MLRA 20 (AgE2)** is a somewhat excessively drained soil that occurs on the backslopes of hillsides. It is a residuum soil that is weathered from soft sandstone and a typical soil profile contains three horizons. The first two horizons occur to a depth of 58 inches and contain loamy sand, and the third horizon occurs to a depth of 79 inches and contain bedrock. Available water storage is moderate (about 7.5 inches). This soil is not prone to flooding or ponding and the runoff class is low. AgE2 is mapped along La Coronilla Drive and within the northern portion of the Vic Trace Reservoir and covers approximately 47 percent of the Study Area.
- **Ayar Clay, 15 to 30 Percent Slopes, Eroded (AhE2)** is a well-drained soil that occurs on the backslope of hillsides. It is a residuum soil that is weathered from mudstone or calcareous shale and a typical soil profile contains two distinct horizons. The first horizon occurs to a depth of 40 inches and contains clay and the second horizon occurs to a depth of 44 inches and contains weathered bedrock. Available water storage is moderate (about 6.4 inches). This soil is not prone to flooding or ponding and the runoff class is very high. AhE2 is generally mapped along Dolores Drive and within the southern portion of the Vic Trace Reservoir and covers approximately 43 percent of the Study Area.
- **Ayar Clay, 50 to 75 Percent Slopes (AhG)** is a well-drained soil that occurs on the backslope of hillsides. It is a residuum soil that is weathered from mudstone or calcareous shale and a typical profile contains two horizons. The first horizon occurs to a depth of 40 inches and contains clay and the second horizon occurs to a depth of 44 inches and contains weathered bedrock. Available water storage is moderate (about 6.4 inches). This soil is not prone to flooding or ponding and the runoff class is very high. AhG is mapped within the eastern corner of the Vic Trace Reservoir and covers approximately five percent of the Study Area.
- **Concepcion Fine Sandy Loam, 2 to 9 Percent Slopes (CgC)** is a moderately well drained soil that occurs on the footslope of terraces. It is formed from mixed alluvium and a typical soil profile contains three distinct horizons. The first horizon occurs to a depth of 26 inches and contains fine sandy loam, the second horizon occurs to a depth of 37 inches and contains clay, and the third horizon occurs to a depth of 64 inches and contains clay loam. Available water storage is low (about 3.6 inches). This soil is not prone to flooding or ponding and the runoff class is very high. CgC is mapped along the western extent of Dolores Road and along the majority of Meigs Road and covers approximately six percent of the Study Area.

[1] Published soil surveys are documented at a broad scale, and may not match the level of detail or refinement captured during formal jurisdictional delineation surveys, which were not relevant to this Project.

Additional data provided by NRCS SSURGO, 2024.

3.2.2 Vegetation and Other Land Cover

Nine vegetation communities and land cover types were documented within the Study Area during the field survey. Table 2 lists each vegetation community and land cover type documented and provides their approximate acreage and the percent area covered in the Study Area. Figure 4 depicts the locations of each vegetation community and land cover type in the Study Area. Brief descriptions of the vegetation communities and land cover types are provided in the subsections below and representative photographs are provided in Appendix C.

The vegetation classification used for this analysis is based on *A Manual of California Vegetation, Second Edition* (MCV2; Sawyer et al. 2009). The land cover types that are not described in MCV2 were classified using conventional naming practices (i.e., nonnative/ornamental and developed/disturbed). One CDFW sensitive natural community, lemonade berry scrub, is present in the Study Area (CDFW 2025b).

Table 2 Summary of Vegetation Communities and Land Cover Types within the Study Area

Type	Approximate Acreage	Approximate Percent Area
California Sagebrush Scrub	0.07	0.4%
Coast Live Oak Woodland	0.67	3.5%
Developed/Disturbed	9.78	51.3%
Eucalyptus Groves	0.51	2.7%
Iceplant Mats	2.76	14.5%
Lemonade Berry Scrub*	0.29	1.5%
Landscape/Ornamental	0.47	2.5%
Quailbush Scrub	0.23	1.2%
Wild Oats and Annual Brome Grassland	4.3	22.5%
Total	**19.08**	**100.00%**

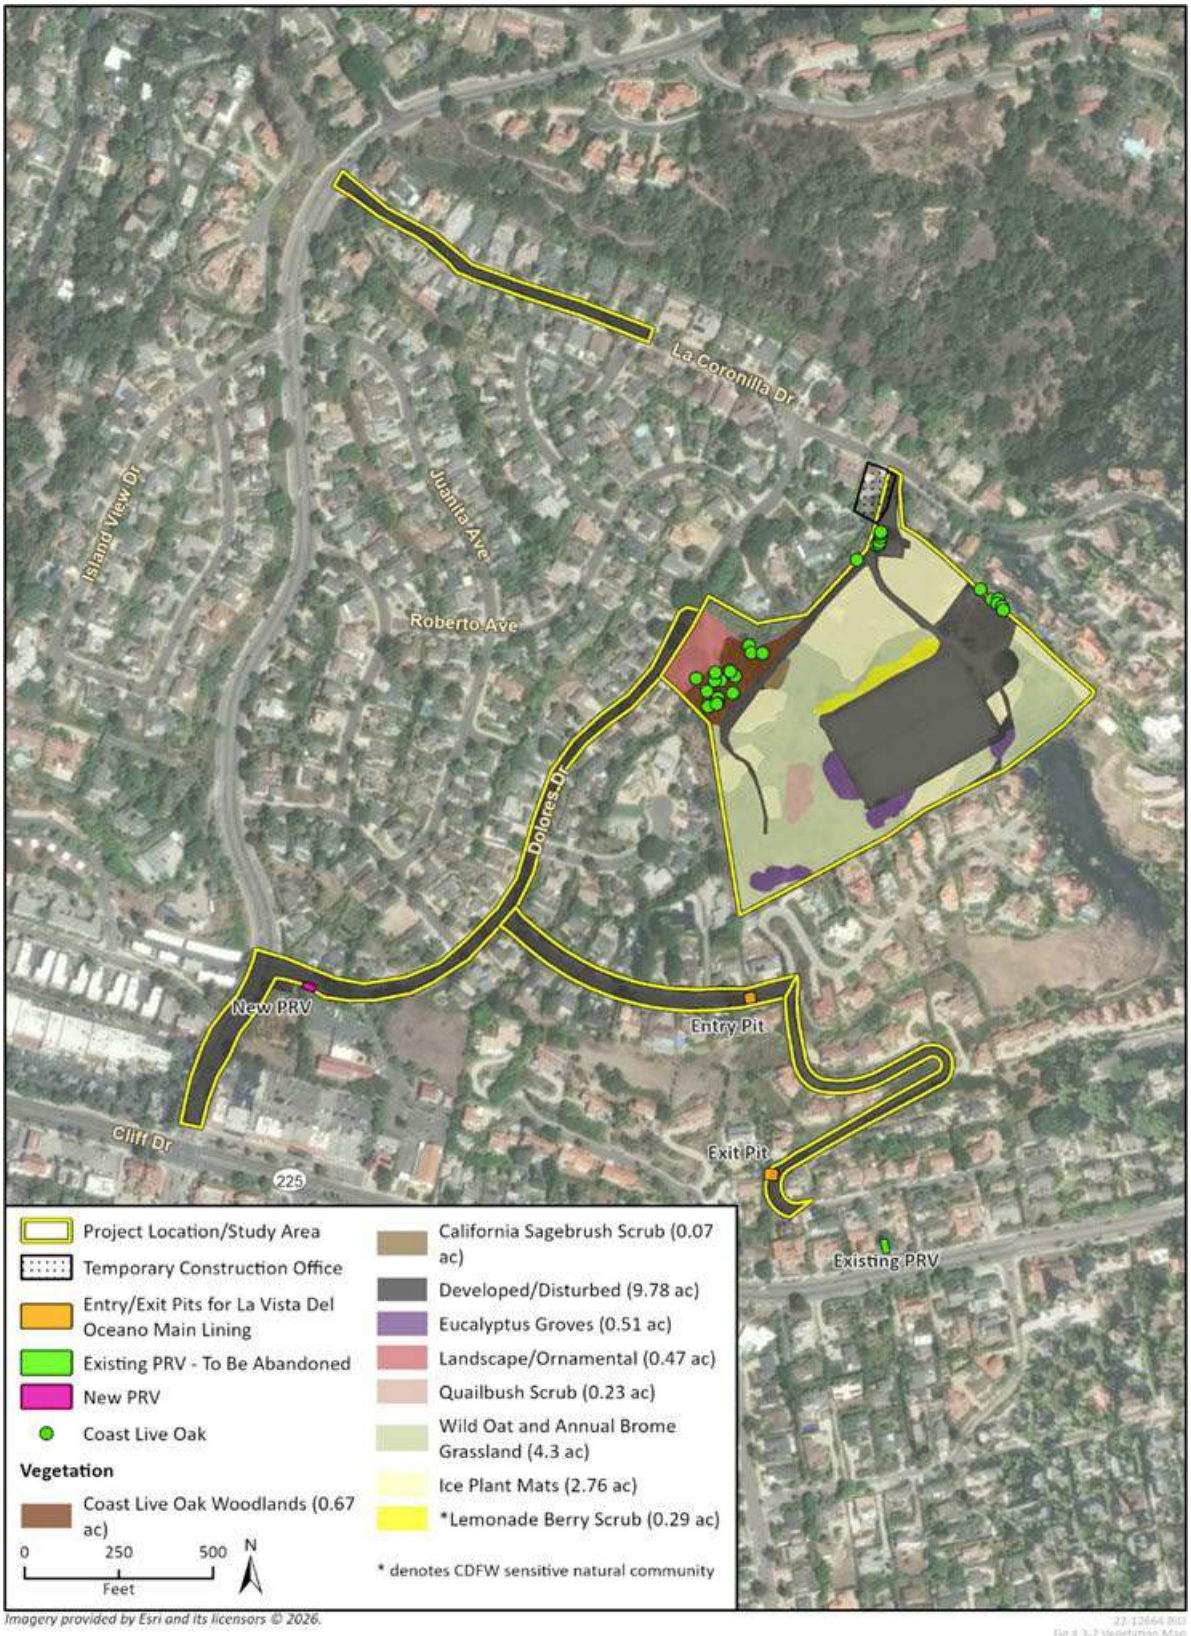
*Classified as a CDFW-designated sensitive vegetation community.

California Sagebrush Scrub (*Artemisia californica* Shrubland Alliance)

California sagebrush scrub (*Artemisia californica* Shrubland Alliance) is typically found along slopes that are steep and rarely flooded, or on low-gradient deposits along streams between zero and 3,940 feet above mean sea level. Soils are alluvial or colluvial derived and shallow. California sagebrush (*Artemisia californica*) contributes to at least 60 percent relative cover in the shrub layer (Sawyer et al. 2009). This vegetation community is not considered sensitive (CDFW 2025b).

California sagebrush scrub is present in the Study Area and is located generally east of La Coronilla Park within the Vic Trace Reservoir property on a northwest facing slope. California sagebrush is the dominant species with sparse herbaceous understory of non-native grasses. This community is surrounded by non-native grassland and iceplant mats where it occurs in the Study Area.

Figure 4 Vegetation Communities and Land Cover Types



Coast Live Oak Woodland and Forest (*Quercus agrifolia* Forest and Woodland Alliance)

Coast live oak woodland and forest (*Quercus agrifolia* Forest and Woodland Alliance) is a warm temperate woodland/forest vegetation community that occurs along canyon bottoms, slopes, and flats. The soils are deep, high in organic matter, and contain sand or loam. Coast live oak is the dominant or codominant in the tree canopy where it must contain 50 percent or greater relative cover. Common co-dominants and associates include big leaf maple (*Acer macrophyllum*), valley oak (*Quercus lobata*), and California bay (*Umbellularia californica*). The tree canopy is open to continuous, the shrub layer is sparse to intermittent, and the herbaceous layer is sparse to continuous. This vegetation alliance is not considered sensitive (CDFW 2025b).

This vegetation community is located on a northwest facing slope between La Coronilla Park and the Vic Trace Reservoir property. Coast live oak is the dominant species and contains continuous to intermittent canopy cover. The shrub stratum was generally dominated by California sagebrush and coyote brush (*Baccharis pilularis*). The herbaceous understory is sparse and consists of non-native forbs and annual grasses.

Disturbed/Developed

The disturbed/developed land cover type consists of areas that have been developed or otherwise physically altered to the extent that they no longer support most vegetation. Developed land is characterized by the presence of structures, gravel lots, pavement, or hardscape. This land cover type may also contain areas that are sparsely vegetated, primarily with ornamental and/or invasive species.

Within the Study Area, disturbed/developed land is associated with the roadways and infrastructure serving the Vic Trace Reservoir, and developed streets outside the reservoir property along La Coronilla Drive, Dolores Drive, Meigs Road, Ricardo Avenue, and La Vista Del Oceano. The groundcover generally contains asphalt, pavement, or modified soils. A trace amount of landscape/ornamental and/or non-native annual herbaceous species is present surrounding these features but do not provide enough cover to constitute their own land cover type. Disturbed/developed land is not officially identified in MCV2 (Sawyer et al. 2009).

Eucalyptus Grove (*Eucalyptus* spp. Semi-Natural Alliance)

Eucalyptus grove (*Eucalyptus* spp. Semi-Natural Alliance) is found planted as trees, groves, and windbreaks, as well as in settings where it has become naturalized on uplands or bottomlands and adjacent to stream courses, lakes, or levees from sea level to 1,900 meters in elevation. Eucalyptus species consist of over 80 percent cover within the tree layer. The understory of this community is generally poorly developed or composed of low-growing forbs and non-native grasses due to the excessive shade and possibly toxic properties produced by the eucalyptus leaf litter. This vegetation community is not considered a CDFW sensitive natural community (CDFW 2025b).

Stands of red iron bark (*Eucalyptus sideroxylon*) border the south side of the reservoir structure within the Vic Trace Reservoir property. Black locust (*Robinia pseudoacacia*) trees are also present intermittently throughout this vegetation community, with non-native grasslands, lemonade berry, and iceplant mats growing outside the tree canopy.

Ice Plant Mats (*Carpobrotus* spp. Herbaceous Semi-Natural Alliance)

Ice plant mats (*Carpobrotus* spp. Herbaceous Semi-Natural Alliance) typically occur on bluffs, disturbed, land, and sand dunes near the coastline between sea level and 10 meters in elevation. This alliance is characterized by an intermittent to continuous herbaceous layer. Iceplant species (*Carpobrotus* spp.) are dominant with over 50 percent relative cover (Sawyer et al. 2009). This community is not considered a CDFW sensitive natural community (CDFW 2025b).

Ice plant mats are present in several areas within the Vic Trace Reservoir property with ice plant forming a dense carpet, limiting the presence of other vegetation. California sagebrush occurs infrequently among the ice plant with non-native grasses and forbs filling gaps in the ice plant mats.

Landscape/Ornamental

The landscape/ornamental land cover type consists of human-altered vegetative landscapes for aesthetical or recreational purposes. Within the Study Area, this land cover type is located within La Coronilla Park between Dolores Drive and the coast live oak woodland to the east, where the park is planted with landscape succulents and shrubs along the sidewalk and maintained for access by park users. Open areas within this cover type are dominated by non-native grasses. This land cover type is not officially identified in the MCV2 (Sawyer et al. 2009).

Lemonade Berry Scrub (*Rhus integrifolia* Shrubland Alliance)

Lemonade berry scrub (*Rhus integrifolia* Shrubland Alliance) typically occurs in sloped landscapes and on coastal bluffs where loam and clay soils are present. This community occurs between 5 and 750 meters in elevation, generally along the coast in southern California. Lemonade berry consists of 50 percent or more of the relative cover within the shrub stratum (Sawyer et al. 2009). Lemonade berry scrub is considered a CDFW sensitive natural community (CDFW 2025b).

Within the Study Area, there is a stand of lemonade berry scrub along the northwest side of the constructed reservoir. Lemonade berry scrub is the dominant species in this area with California sagebrush and toyon also present. Eucalyptus is intermittent in tree canopy and non-native forbs and shrubs are present in the herbaceous understory where canopy gaps occur.

Quailbush Scrub (*Atriplex lentiformis* Shrubland Alliance)

Quailbush scrub is an alkaline saltbush scrub community that typically occurs on south facing slopes or adjacent to alkaline washes or dry lakebeds on clay soils. Quailbush (*Atriplex lentiformis*) or Torrey's saltbush (*Atriplex torreyi*) are dominant where either species must have greater than 50 percent relative cover in the shrub canopy (CNPS 2025b). The shrub canopy is open to intermittent and California sagebrush (*Artemisia californica*), four-wing saltbush (*Atriplex canescens*), arrow weed (*Plucea sericea*) and tamarisk (*Tamarix* spp.) may be present as common associates. The herbaceous layer is variable, and the emergent trees may be present at low cover. This vegetation community is not considered sensitive (CDFW 2025b).

Within the Study Area quailbush scrub is present southwest of the constructed reservoir on the Vic Trace Reservoir property. Quailbush scrub cover is dominant where it occurs and has a contiguous to intermittent canopy. Non-native grasses and forbs are present in the understory between shrubs.

Wild Oats and Annual Brome Grasslands (*Avena* spp. – *Bromus* spp. Herbaceous Semi-Natural Alliance)

Wild oats and annual brome grasslands (*Avena* spp. – *Bromus* spp. Herbaceous Semi-Natural Alliance) are generally found in open areas in valleys and foothills throughout coastal and interior California. It typically occurs on soils consisting of fine-textured loams or clays that are somewhat poorly drained. Non-native annual grasses and weedy annual and perennial forbs, primarily of Mediterranean origin, dominate this vegetation type, probably as a result of human disturbance. Scattered native grass and wildflower species, representing remnants of the original vegetation may also be common (Sawyer et al. 2009). This vegetation alliance is not considered sensitive (CDFW 2025).

Wild oats and annual brome grasslands occur on the Vic Trace Reservoir property within the Study Area, in open areas that separate the iceplant mats, shrub/scrub areas, and tree stands. These areas are dominated by non-native grasses such as wild oat (*Avena barbata*), brome species (*Bromus* spp.), Bermuda grass (*Cynodon dactylon*), short-podded mustard (*Hirschfeldia incana*), and other species that were unidentifiable due to mowing of the vegetation.

3.2.3 General Wildlife

Common woodland, ruderal, and urban wildlife species were observed during the survey. The most notable and abundant species observed included northern mockingbird (*Mimus polyglottos*), Eurasian collared dove (*Streptopelia decaocto*), and house finch (*Haemorhous mexicanus*). A complete list of all the plant and wildlife species observed within the Study Area is included in Appendix C.

4 Sensitive Biological Resources

This section discusses special-status species and sensitive biological resources observed on the Project site, and evaluates the potential for the Project site to support additional sensitive biological resources. Assessments for the potential occurrence of special-status species are based upon known ranges, habitat preferences for the species, species occurrence records from the CNDDB and other sources, species occurrence records from other sites in the vicinity of the survey area, previous reports for the Project site, and the results of surveys of the Project site. The potential for each special-status species to occur in the Study Area was evaluated according to the following criteria:

- **No Potential.** Habitat on and adjacent to the site is clearly unsuitable for the species requirements (foraging, breeding, cover, substrate, elevation, hydrology, plant community, site history, disturbance regime), and species would have been identifiable on the site if present (e.g., oak trees). Protocol surveys (if conducted) did not detect species.
- **Low Potential.** Few of the habitat components (foraging, breeding, cover, substrate, elevation, hydrology, plant community, site history, disturbance regime) meeting the species requirements are present, and/or the majority of habitat on and adjacent to the site is unsuitable or of very poor quality. The species is not likely to be found on the site. Protocol surveys (if conducted) did not detect species.
- **Moderate Potential.** Some of the habitat components (foraging, breeding, cover, substrate, elevation, hydrology, plant community, site history, disturbance regime) meeting the species requirements are present, and/or only some of the habitat on or adjacent to the site is unsuitable. The species has a moderate probability of being found on the site.
- **High Potential.** All the habitat components (foraging, breeding, cover, substrate, elevation, hydrology, plant community, site history, disturbance regime) meeting the species requirements are present and/or most of the habitat on or adjacent to the site is highly suitable. The species has a high probability of being found on the site.
- **Present.** Species is observed on the site or has been recorded (e.g., CNDDB, other reports) on the site recently (within the last 5 years).

4.1 Special-Status Species

The literature and database review identified 69 special-status plant and animal species that are known to occur in the vicinity of the Study Area. Of these 69 species, ten species (five plants and five animals) were determined to have a potential to occur in the Study Area. Each of these ten special-status species, its listing status, and its determination of potential to occur are presented in Table 3. Nine of the species were determined to have a low potential to occur. While the site contains elements of potentially suitable habitat for these species, this habitat is limited in size, previously disturbed, surrounded by development, and isolated from larger stands of contiguous habitat. These factors substantially reduce the potential for occurrence.

The remaining special-status species identified during the literature and database review are not anticipated to occur based on a variety of factors, including the lack of suitable habitat and/or the Study Area location in relation to the species known geographic and/or elevation range(s). Species which are likely to only traverse through the area during limited foraging or migratory periods were not considered to have a potential to occur in the Study Area. Appendix D includes the potential to

occur determinations and justification on those determinations for all special-status species identified during the literature and database review along with their listing statuses, habitat requirements, and habitat suitability/observation notes. A more detailed analysis of the State fully protected species that has a moderate potential to occur, white-tailed kite (*Elanus leucurus*), is provided below.

Table 3 Special-Status Species with Potential to Occur within the Study Area

Scientific Name	Common Name	Status[1]	Potential to Occur
Plants			
Amsinckia douglasiana	Douglas' fiddleneck	LR	Low
Astragalus didymocarpus var. *milesianus*	Miles' milk-vetch	CRPR 1B.2	Low
Calandrinia breweri	Brewer's calandrinia	LR	Low
Calochortus catalinae	Catalina mariposa-lily	LR	Low
Phacelia hubbyi	Hubby's phacelia	LR	Low
Reptiles			
Aspidoscelis tigris stejnegeri	Coastal whiptail	SSC	Low
Phrynosoma blainvillii	Coast horned lizard	SSC	Low
Salvadora hexalepis virgultea	Coast patch-nosed snake	SSC	Low
Birds			
Elanus leucurus	White-tailed kite	FP	Moderate
Mammals			
Lasiurus frantzii	Western red bat	SSC	Low

[1] FP = State Fully Protected; SCE = State Candidate Endangered; SSC = Species of Special Concern; LR = Locally Rare (Santa Barbara Botanical Gardens, Wilken 2018); CRPR 1B.2 = Plants rare, threatened, or endangered in California and elsewhere

4.1.1 Special-Status Plant Species

There are no special-status plant species with moderate or higher potential to occur within the Project site.

4.1.2 Special-Status Wildlife Species

White-Tailed Kite

White-tailed kite, a State fully protected species, regularly breeds along the Santa Barbara coastline. This species nests in trees, usually with a dense canopy, but nest trees can vary from single, isolated trees to trees within large woodlands, including (in order of frequency used) oaks, pines, Monterey cypress, eucalyptus, and willows. Nest and roost trees are often located in woodlands adjacent to grasslands, meadows, or marshes which are utilized as foraging habitat (CDFW 2005).

The Study Area provides suitable nesting and roosting habitat for the species, as large coast live oak, eucalyptus, and other ornamental trees are present within the Study Area. Additionally, this species has been recently documented within 5 miles of the Study Area with the closest occurrence record located approximately 4 miles west of the Study Area within the More Mesa Open Space (CDFW 2025a). However, the Study Area appears to be frequently mowed, contains a degree of disturbance, and is completely surrounded by urban/developed land, factors which reduce the suitability of the habitat.

4.1.3 Other Protected Species

Nesting Birds

The Study Area contains habitat that can support nesting birds, including raptors, protected under CFGC Section 3503 and the MBTA (16 United States Code Sections 703–712). Potential nesting sites for raptors are located within the eucalyptus, coast live oak, and ornamental trees scattered throughout the Study Area. These trees, along with the Study Area's native shrubs, landscape/ornamental vegetation, and developed structures also have the potential to support other species of nesting birds.

4.2 Sensitive Natural Communities and Critical Habitat

Vegetation communities are considered sensitive biological resources if they have limited distributions, have high-wildlife value, include special-status species, or are particularly susceptible to disturbance. The CDFW ranks natural and sensitive communities using NatureServe's Heritage Methodology, the same system used to assign global and state rarity ranks for plant and animal species in the CNDDB. Plant communities with a rating of S1, S2, or S3 are considered sensitive communities by the CDFW.

The current Sensitive Natural Communities List (CDFW 2025b) was referenced to determine sensitivity status of the vegetation communities within the Study Area. Lemonade berry scrub is present within the Study Area and is currently ranked as an S3. S3 plant communities are vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making them vulnerable to extirpation (NatureServe 2025).

4.3 Jurisdictional Waters and Wetlands

No potentially jurisdictional aquatic features are located within the Study Area.

4.4 Wildlife Movement

Wildlife corridors, or habitat linkages, are generally defined as connections between habitat patches that allow for physical and genetic exchange between otherwise isolated animal populations. Such linkages may serve a local purpose, such as between foraging and denning areas, or they may be regional in nature, allowing movement across the landscape. Some habitat linkages may serve as migration corridors, wherein animals periodically move away from an area and then subsequently return. Others may be important as dispersal corridors for young animals. A group of habitat linkages in an area can form a wildlife corridor network.

The habitats in the linkage do not necessarily need to be the same as the habitats that are being linked. Rather, the linkage merely needs to contain sufficient cover and forage to allow temporary inhabitation by ground-dwelling species. Typically, habitat linkages are contiguous strips of natural areas, though dense plantings of landscape vegetation can be used by certain disturbance-tolerant species. Depending upon the species using a corridor, specific physical resources (e.g., rock outcroppings, vernal pools, or oak trees) may need to be in the habitat link at certain intervals to allow slower-moving species to traverse the link. For highly mobile or aerial species, habitat linkages

may be discontinuous patches of suitable resources spaced sufficiently close together to permit travel along a route in a short period of time.

Wildlife movement corridors can be both large- and small-scale. Due to the urban setting and isolated nature of the Study Area, it does not likely support terrestrial wildlife movement on a large or small scale.

4.5 Resources Protected by Local Policies and Ordinances

The Study Area occurs within the jurisdiction of the City. The General Plan and Municipal Code of the City include goals, policies, and ordinances intended to protect, preserve, and enhance natural habitats and biological resources to varying degrees, including trees, riparian areas, and water resources (City of Santa Barbara 2011). Specifically, Environmental Resources (ER) Policy ER11, ER15, and ER17 apply to this Project. These policies state the following:

- **ER11: Native and Other Trees and Landscaping.** Protect and maintain native and other urban trees, and landscaped spaces, and promote the use of native or Mediterranean drought-tolerant species in landscaping to save energy and water, incorporate habitat, and provide shade.
- **ER15: Creek Resources and Water Quality.** Encourage development and infrastructure that is consistent with City policies and programs for comprehensive watershed planning, creeks restoration, water quality protection, open space enhancement, storm water management, and public creek and water awareness programs.
- **ER17: Creek Setbacks, Protection, and Restoration.** Protection and restoration of creeks and their riparian corridors is a priority for improving biological values, water quality, open space and flood control in conjunction with adaptation planning for climate change.

Chapter 15.20 and 14.56 of the Santa Barbara Municipal Code (SBMC) are the relevant ordinances that pertain to this Project.

- Chapter 15.20 of the SBMC requires a permit to "plant, prune, trim, perform maintenance on, or remove any tree planted in a parkway strip, tree well, public area[2] or street right-of-way trees" in a City street Right of Way (ROW).
- Chapter 14.56 of the SBMC includes ordinances related to the protection of natural watercourses and City storm drain systems, requiring a permit for activities that may:
  - Discharge pollutants to a watercourse,
  - Grade or place fill within a watercourse, or
  - Construct within a watercourse (including the placement of structures, pipe, impervious material, or channel lining).

Chapter 14.56 mentions that the implementation of these ordinances will adhere to the applicable federal or state statute or regulation that allocates for the greatest protection of the environment.

[2] "Public Areas" includes parks, playgrounds, areas around public buildings and all other areas under the supervision and maintenance of the City not including any street right-of-way.

4.5.1 Protected Trees

Several coast live oak trees were documented and mapped within the Study Area as shown on Figure 3. In addition, street trees occur within the Study Area. These trees are likely regulated by the City under Municipal Code Section 15.20.

4.6 Habitat Conservation Plans

The Project is not subject to an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan.

4.7 Floodplain Management, Protection of Wetlands, Critical Habitat, Coastal Zone, Wild and Scenic Rivers, Essential Fish Habitat, Coastal Barrier Resources, and Fish and Wildlife Coordination Act

The Study Area is located outside of designated flood hazard areas, as defined by Executive Order (EO) 11988.

Under EO 11990, federal agencies must avoid affecting wetlands unless it is determined no practical alternative is available. As described in the previous *Jurisdictional Waters and Wetlands* section, no jurisdictional wetlands occur within the Study Area.

Additionally, the Study Area is not within the Coastal Zone or any federally designated Wild and Scenic Rivers. The Study Area does not contain critical habitat as designated by the USFWS or National Marine Fisheries Service (NMFS) for threatened or endangered plant or wildlife species. The closest USFWS-designated critical habitat is for tidewater goby (*Eucyclogobius newberryi*), located approximately 1.3 miles east of the Vic Trace Reservoir parcel in Arroyo Burro Creek (USFWS 2025b). The closest NMFS-designated critical habitat is for steelhead – southern California DPS (*Oncorhynchus mykiss irideus* pop. 10), approximately 1.3 miles east of the Vic Trace Reservoir parcel in the Arroyo Burro Creek (NMFS 2025). Furthermore, the Study Area is not within or adjacent to any Essential fish habitat, within lands covered by the Coastal Barrier Resources System, nor does it contain resources regulated by the Fish and Wildlife Coordination Act.

5 Impact Analysis and Mitigation Measures

The findings of the assessment are considered in the impact analysis below.

5.1 Special-Status Species

The proposed Project would have a significant effect on biological resources if it would:

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.

5.1.1 Special-Status Plant Species

No special-status plant species were observed within the Study Area during the reconnaissance-level field survey. No federally threatened or endangered plant species have potential to occur within the Study Area, and no designated critical habitat occurs within or adjacent to the Study Area. Therefore, the Project would have no effect on special-status plant species under NEPA.

Five special-status plant species have a low potential to occur within the Study Area, including Douglas' fiddleneck (*Amsinckia douglasiana*), Miles' milk-vetch (*Astragalus didymocarpus* var. *milesianus*), Brewer's calandrinia (*Calandrinia breweri*), Catalina mariposa-lily (*Calochortus catalinae*), and Hubby's phacelia (*Phacelia hubbyi*). While the Study Area contains elements of potentially suitable habitat for these species, this habitat is limited in size, previously disturbed, surrounded by development, and isolated from larger stands of contiguous habitat. These factors substantially reduce the potential for occurrence.

Direct impacts to special-status plant species could include mortality or habitat destruction, should ground disturbance or other construction activities occur within the vicinity of special-status plant species. However, due to the limited habitat within the Study Area and low potential for non-listed special-status plant species to occur, the number of individuals affected by the Project would be low, if any, and would not result in population-level effects on these species. Indirect impacts to special-status plant species potentially occurring outside of the Study Area could occur from dust or run-off material generated during construction but would be minor as the Study Area is surrounded by development. Impacts to special-status plant species under CEQA would be less than significant and would be further reduced through Mitigation Measure BIO-1 and BIO-4. These mitigation measures would require a worker environmental training program for identification of special-status plant species (BIO-1) and biological monitoring during construction (BIO-4).

5.1.2 Special-Status Wildlife Species

No federally listed special-status wildlife species were determined to have a moderate or high potential to occur in the Study Area, based on prior development, ongoing disturbances, and lack of suitable plant communities. Therefore, the Project would have no effect on federally listed special-status wildlife species under NEPA.

Vegetation surrounding the Vic Trace Reservoir and associated workspaces, staging, and parking areas has the potential to support State-listed special-status wildlife species.

One fully protected species, white-tailed kite (*Elanus leucurus*), has a moderate potential to occur within the Study Area. This species may utilize suitable nesting and roosting habitat, such as large coast live oak, eucalyptus, and other ornamental trees located within the Study Area. Suitable nesting habitat for the species may be impacted by the Project, and potentially significant impacts may result if construction occurs while the species is present within or adjacent to the work areas. However, implementation of Mitigation Measures BIO-1 through BIO-4 would mitigate potential impacts to a less-than-significant level.

Five additional special-status wildlife species, which were not observed or detected during the biological survey, were determined to have potential to occur within the Study Area based upon known ranges, habitat preferences for the species, and species occurrence records from CNDDB. Coastal whiptail (*Aspidoscelis tigris stejnegeri*), coast horned lizard (*Phrynosoma blainvillii*), coast patch-nosed snake (*Salvadora hexalepis virgultea*), and western red bat (*Lasiurus frantzii*) have a low potential to occur within the Study Area. Marginally suitable habitat for these species (rocky or vegetated drainages with limited or no riparian vegetation) is present adjacent but outside of the Study Area.

These impacts would be potentially significant absent mitigation, but would be reduced to a less-than-significant level under CEQA through implementation of Mitigation Measures BIO-1 through BIO-4. These mitigation measures would require a worker environmental training program for identification of special-status wildlife species (BIO-1), a Nesting Bird Management Plan (BIO-2), special-status wildlife species surveys (BIO-3), and biological monitoring during construction (BIO-4). Indirect impacts for these species would not be significant because the proposed activities would be temporary and localized.

In addition to special-status species, the Vic Trace Reservoir parcel contains habitat which can support nesting birds, including raptors, protected under the CFGC and the MBTA. The native, non-native, and ornamental vegetation throughout the Study Area provides suitable nesting habitat for avian species. Specifically, the mature coast live oak and eucalyptus trees throughout the Study Area contain suitable habitat for raptor species while the various ornamental and coastal scrub shrub layers provide suitable habitat for passerine species. Potentially significant direct impacts to raptors and other nesting birds may result if construction occurs while they are present within or adjacent to the Project footprint, through direct mortality or abandonment of nests. Though localized impacts to common avian species do not constitute potentially significant impacts under CEQA, the destruction of nests during construction activities would be a violation of the MBTA and CFGC Section 3503 and therefore must be avoided. Implementation of Mitigation Measures BIO-1 through BIO-4 would maintain compliance with these federal and State laws.

Therefore, impacts related to candidate, sensitive, or special-status wildlife species would be less than significant with mitigation incorporated.

LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED

5.1.3 Mitigation Measures

BIO-1 Worker Environmental Awareness Program

Prior to the start of construction, all Project construction personnel shall attend an in-person Worker Environmental Awareness Program (WEAP) training, conducted by a City-approved biologist, to assist workers in recognizing biological resources which may occur in the Project area. The specifics of this program shall include:

- Identification of special-status species with potential to occur in the Project area;
- A description of the regulatory status and general ecological characteristics of special-status species with potential to occur;
- A review of the limits of construction and measures required to avoid and minimize impacts to biological resources within the work area; and
- Information regarding nesting birds.

The City-approved biologist shall have the discretion to determine whether additional sensitive biological resources are included within the WEAP training. Project construction personnel shall sign a form provided by the trainer documenting they have attended the WEAP and understand the information presented to them. The Project contractor shall be responsible for ensuring crew members adhere to the guidelines and restrictions designed to avoid impacts to special-status species. When new construction personnel are added to the Project, the contractor shall confirm the new personnel receive the WEAP training before starting work. The training of personnel can include a video recording and/or the use of written materials rather than in-person training by the City-approved biologist.

BIO-2 Nesting Bird Management Plan

Prior to the start of construction, the City shall approve a Nesting Bird Management Plan for the Project. The Nesting Bird Management Plan shall be prepared by a City-approved biologist and shall include measures to avoid the unauthorized take or destruction of birds, eggs, or active nests, consistent with the Migratory Bird Treaty Act and Sections 3503, 3503.5, 3511, and 3513 of the California Fish and Game Code. At a minimum, the Plan shall include:

- Procedures, such as surveys, for determining whether nesting birds are present at or near Project work areas;
- Procedures for assessing the species, nesting stage, and expected fledge date if nesting birds are present;
- Procedures for establishing protective buffers, to be assessed on a nest-specific basis considering the species concerned, the stage of nesting, the proposed work activities in proximity to the nest, and intervening vegetation or other factors that could attenuate impacts;
- Descriptions of allowed and prohibited activities within specific nest buffers, as well as procedures for allowing encroachment into buffers;
- Procedures for addressing pauses in construction which may result in changed environmental conditions or presence of new nests; and
- Procedures for addressing inadvertent injury to birds, including identification of appropriate wildlife rehabilitation facilities.

Requirements in the Nesting Bird Management Plan shall consider the season at which activities are occurring, and corresponding levels of avian activity and sensitivity.

BIO-3 Pre-Construction Presence/Absence Survey for Special-Status Wildlife Species

Within seven days prior to the commencement of ground-disturbing activities, a City-approved biologist shall be retained to perform a survey for white tailed kite, Coastal whiptail, coast horned lizard, coast patch-nosed snake, and western red bat in natural habitat areas within the Project

footprint and an appropriate buffer to determine the presence/absence of these species. The pre-construction survey shall be conducted on foot within the Project footprint and buffer. The City-approved biologist shall temporarily move any identified special-status species to outside of the construction area, and if appropriate temporary barriers shall be employed to prevent the animal's ingress to the Project area. Construction shall not proceed until the work area is determined to be free of special-status species. The results of these surveys shall be documented in a technical memorandum and provided to the City.

BIO-4 Biological Construction Monitoring

A City-approved biological monitor shall be present during initial ground disturbing activities and vegetation removal to confirm impacts to special-status plant and wildlife species are avoided. The monitor shall have the authority to halt construction activities to avoid potential impacts to special-status species. The results of biological monitoring shall be recorded and provided to the City.

5.2 Sensitive Natural Communities and Critical Habitat

The proposed Project would have a significant effect on biological resources if it would:

b) Have a substantial adverse impact on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or US Fish and Wildlife Service.

As shown in Table 2, one sensitive natural community occurs within the Study Area: lemonade berry scrub (*Rhus integrifolia* shrubland alliance), which is listed on the CDFW's Sensitive Natural Communities List (CDFW 2025b).

The proposed Project would result in the complete removal of the existing, 0.29-acre lemonade berry scrub, which is located entirely within the footprint of the proposed reservoir, via excavation and grading around the reservoir during construction. As the existing area of lemonade berry scrub would be completely redeveloped, restoration or re-establishment of the lemonade berry scrub within its current location would not be feasible. Consequently, this direct impact would constitute a permanent loss of lemonade berry scrub, and would represent a potentially significant impact requiring compensatory mitigation to offset the loss of this sensitive natural community. The Project would include implementation of Mitigation Measure BIO-5, which would require preparation of a Habitat Restoration Plan to offset the loss of the lemonade berry scrub. Following implementation of Mitigation Measure BIO-5, impacts related to lemonade berry scrub would be less than significant with mitigation incorporated.

LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED

5.2.1 Mitigation Measures

BIO-5 Lemonade Berry Scrub Restoration Plan

The City shall retain a City-approved biologist/restoration ecologist to prepare a Lemonade Berry Scrub Restoration Plan (RP) designed to offset construction-related impacts to lemonade berry scrub within the Project site.

The RP shall provide compensatory restoration at a minimum ratio of 1:1 (e.g. 0.29 acre of lemonade berry scrub). Performance standards to be included in the RP shall be tied to measurable outcomes, such as percent native cover, species composition, and shrub survival rates.

The RP shall include the following:

- A description of the impacted lemonade berry scrub
- A plant palette and methods of salvaging (including topsoil salvage), propagating, seeding, and/or planting the site to be restored;
- A schedule for restoration activities, that may include weed abatement, propagating and planting, soil preparation, and/or erosion control, ;
- Performance standards including: (1) survival of installed shrubs (e.g., 80 percent survival after two years), (2) native cover targets matched to reference conditions, and (3) absence thresholds for invasive species;
- Maintenance and monitoring necessary to confirm the restoration area meets the success criteria; and
- Identification of contingency and adaptive management measures to address unforeseen changes in site conditions or other components of the restoration project.

5.3 Jurisdictional Waters and Wetlands

The proposed Project would have a significant effect on biological resources if it would:

c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

The Project is not located within or adjacent any jurisdictional waters or wetlands (including marshes, vernal pools, etc.). No impacts to these resources would occur.

NO IMPACT

5.4 Wildlife Movement

The proposed Project would have a significant effect on biological resources if it would:

d) Interfere substantially with the movement of any resident or migratory fish or wildlife species or with established resident or migratory wildlife corridors, or impede the use of wildlife nursery sites.

No wildlife movement corridors or wildlife nursery sites are present within the Study Area. The Study Area is surrounded by development and does not serve as a connector between larger habitat areas. Additionally, no water sources or features are present besides the reservoir, which is covered and does not allow wildlife access. The Study Area likely supports local wildlife for foraging needs; however it is expected that construction activities may temporarily affect these species by causing them to avoid the area. Construction will be limited to daylight hours, and presumably not disturb nocturnal animals. All the disturbance described will be temporary, and the wildlife can resume using the area undisturbed once the Project is completed. Impacts involving wildlife movement would be less than significant.

LESS THAN SIGNIFICANT IMPACT

5.5 Resources Protected by Local Policies and Ordinances

The proposed Project would have a significant effect on biological resources if it would:

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance

Several coast live oak trees are documented and mapped within the Study Area, and street trees also occur adjacent to the paved roadways where pipeline improvements would occur. Coast live oak trees are regulated by the City of Santa Barbara under Santa Barbara Municipal Code Section 22.10, and street trees are regulated under Santa Barbara Municipal Code Section 15.20. The Project would include the removal of approximately seven coast live oak trees, which would be replaced on the Vic Trace Reservoir parcel. Additionally, a Tree Management Technical Memorandum would be created for this Project to further outline tree impacts and mitigation measures. Implementation of Mitigation Measure BIO-6 would require the City to inventory all trees protected by Municipal Code Sections 15.20 and 22.10 and outline tree protection measures for all protected trees within the Study Area. Therefore, impacts related to local policies or ordinances protecting biological resources would be less than significant with mitigation incorporated.

LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED

5.5.1 Mitigation Measures

BIO-6 Tree Protection Plan

Prior to the start of construction, an International Society of Arboriculture Certified Arborist shall prepare a Tree Protection Plan (TPP) for any City-protected trees to be retained on site, including trees with a root zone or crown that may be affected by Project activities. Protected trees shall be defined as trees regulated under SBMC 15.20 and 15.24 with at least one trunk measuring 4 inches or greater in diameter at 4 feet 6 inches above the highest natural grade adjacent to the trunk, consistent with City Standards. The TPP shall include, at minimum, the following:

- An inventory of Project site trees with a root zone and/or crown that may be impacted by the Project.
- A graphic depiction of each protected tree and the limits of proposed Project activities that could affect protected trees, including ground disturbance and any clearance trimming.
- Tree protection measures, including:
  - Tree protection fencing, signage, and maintained condition for the duration of construction.
  - Prohibited activities near trees and specified limited activities permitted only under Certified Arborist supervision.
  - Root and crown protection and pruning standards.
  - Measures to maintain tree vigor during construction.
- Tree replacement measures and specifications that shall be incorporated into the Landscape Plan for the Project, including:
  - 75 replacement trees shall planted on site and shall include, *Populus fremontii*, Fremont cottonwood, and *Sambucus mexicana*, blue elderberry species.
  - Replace any unanticipated removed trees, with trees of like species at a minimum 1:1 ratio.

- Replacement trees shall be monitored and maintained for a minimum of two years or until success criteria is achieved earlier.
- Performance success criteria (e.g. 80 percent survival).

5.6 Habitat Conservation Plans

The proposed Project would have a significant effect on biological resources if it would:

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Conservation Community Plan, or other approved local, regional, or state habitat conservation plan.

The Project does not occur within the coverage area of any Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan, and would not cause any impact related to inconsistencies with such a plan. No impact would occur.

NO IMPACT

5.7 Floodplain Management, Protection of Wetlands, Critical Habitat, Coastal Zone, Wild and Scenic Rivers, Essential Fish Habitat, Coastal Barrier Resources, and Fish and Wildlife Coordination Act

The Project does not occur in an area that contains wetlands, floodplains, designated Wild and Scenic Rivers, or designated critical habitat. The Study Area is not within the Coastal Zone, and does not contain coastal barrier resources. Thus, the Project would have no effect on these features.

NO IMPACT

6 Conclusion

Under NEPA, the proposed Project would not significantly affect nesting birds protected by the MBTA or potentially jurisdictional waters, with implementation of the mitigation measures described in the *Impact Analysis and Recommended Measures* section. The proposed Project would not affect federally listed plant or wildlife species, sensitive natural communities, conservation plans, floodplains, wetlands, critical habitat, the Coastal Zone, Wild and Scenic Rivers, Essential Fish Habitat, Coastal Barrier Resources, or resources regulated by the Fish and Wildlife Coordination Act.

Under CEQA, potential impacts to special-status wildlife species, nesting birds, sensitive natural communities, and local policies and ordinances would be less than significant with implementation of the mitigation measures described in the *Impact Analysis and Recommended Measures* section. No potential impacts are expected to jurisdictional aquatic resources, wildlife movement, or conservation plans under CEQA.

7 Limitations, Assumptions, and Use Reliance

This Biological Resources Assessment has been performed in accordance with professionally accepted biological investigation practices conducted at this time and in this geographic area. The biological investigation is limited by the scope of work performed. Reconnaissance biological surveys for certain taxa may have been conducted as part of this assessment but were not performed during a particular blooming period, nesting period, or particular portion of the season when positive identification would be expected if present, and therefore, cannot be considered definitive. The biological surveys are limited also by the environmental conditions present at the time of the surveys. In addition, general biological (or protocol) surveys do not guarantee that the organisms are not present and will not be discovered in the future within the site. In particular, mobile wildlife species could occupy the site on a transient basis, or re-establish populations in the future. Our field studies were based on current industry practices, which change over time and may not be applicable in the future. No other guarantees or warranties, expressed or implied, are provided. The findings and opinions conveyed in this report are based on findings derived from site reconnaissance, review of CNDDB RareFind 5, and specified historical and literature sources. Standard data sources relied upon during the completion of this report, such as the CNDDB, may vary with regard to accuracy and completeness. In particular, the CNDDB is compiled from research and observations reported to CDFW that may or may not have been the result of comprehensive or site-specific field surveys. Although Rincon believes the data sources are reasonably reliable, Rincon cannot and does not guarantee the authenticity or reliability of the data sources it has used. Additionally, pursuant to our contract, the data sources reviewed included only those that are practically reviewable without the need for extraordinary research and analysis.

Regulatory Setting

Regulatory Setting

The following is a brief summary of the regulatory context under which biological resources are managed at the federal, state, and local levels. A number of federal and state statutes provide a regulatory structure that guides the protection of biological resources. Agencies with the responsibility for protection of biological resources within the Study Area include:

- U.S. Army Corps of Engineers (wetlands and other waters of the United States);
- U.S. Fish and Wildlife Service (federally listed species and migratory birds);
- Central Coast Regional Water Quality Control Board (waters of the State);
- California Department Fish and Wildlife (riparian areas, streambeds, and lakes; state-listed species; nesting birds, marine resources)
- California Coastal Commission; and
- City of Santa Barbara

United States Fish and Wildlife Service

The USFWS implements several laws protecting the Nation's fish and wildlife resources, including the ESA; 16 United States Code [USC] Sections 153 et seq, the MBTA; 16 USC Sections 703-711 and the Bald and Golden Eagle Protection Act (16 USC Section 668).

Endangered Species Act

The USFWS and National Marine Fisheries Service (NMFS) share responsibility for implementing the ESA. Generally, the USFWS implements the ESA for terrestrial and freshwater species, while the NMFS implements the ESA for marine and anadromous species. Projects that would result in "take" of any threatened or endangered animal species, or a threatened or endangered plant species if occurring on federal land, are required to obtain permits from the USFWS or NMFS through either Section 7 (interagency consultation with a federal nexus) or Section 10 (Habitat Conservation Plan) of the ESA, depending on the involvement by the federal government in funding, authorizing, or carrying out the Project. The permitting process is used to determine if a Project would jeopardize the continued existence of a listed species and what measures would be required to avoid jeopardizing the species. "Take" under federal definition means to harass, harm (which includes habitat modification), pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct. Proposed or candidate species do not have the full protection of the ESA; however, the USFWS and NMFS advise Project applicants that they could be elevated to listed status at any time.

Migratory Bird Treaty Act

The MBTA of 1918 implements four international conservation treaties that the U.S. entered into with Canada in 1916, Mexico in 1936, Japan in 1972, and Russia in 1976. It is intended to ensure the sustainability of populations of all protected migratory bird species. The law has been amended with the signing of each treaty, as well as when any of the treaties were amended, such as with Mexico in 1976 and Canada in 1995. The MBTA prohibits the take (including killing, capturing, selling, trading, and transport) of protected migratory bird species without prior authorization by the USFWS.

The list of migratory bird species protected by the law, in regulations at 50 CFR Part 10.13, is primarily based on bird families and species included in the four international treaties. A migratory bird species is included on the list if it meets one or more of the following criteria:

- It occurs in the United States or U.S. territories as the result of natural biological or ecological processes and is currently, or was previously listed as, a species or part of a family protected by one of the four international treaties or their amendments;
- Revised taxonomy results in it being newly split from a species that was previously on the list, and the new species occurs in the United States or U.S. territories as the result of natural biological or ecological processes; or
- New evidence exists for its natural occurrence in the United States or U.S. territories resulting from natural distributional changes and the species occurs in a protected family.

In 2004, the Migratory Bird Treaty Reform Act limited the scope of the MBTA by stating the MBTA applies only to migratory bird species that are native to the United States or U.S. territories, and that a native migratory bird species is one that is present as a result of natural biological or ecological processes. The MBTRA requires the USFWS to publish a list of all non-native, human-introduced bird species to which the MBTA does not apply, and an updated list was published in 2020. The 2020 update identifies species belonging to biological families referred to in treaties the MBTA implements but are not protected because their presence in the United States or U.S. territories is solely the result of intentional or unintentional human-assisted introductions.

Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act prohibits anyone, without a permit issued by the USFWS, from "taking" bald or golden eagles, including their parts (including feathers), nests, or eggs. The Act provides criminal penalties for persons who "take, possess, sell, purchase, barter, offer to sell, purchase or barter, transport, export or import, at any time or any manner, any bald eagle ... [or any golden eagle], alive or dead, or any part, nest, or egg thereof." The Act defines "take" as "pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb."

"Disturb" means "to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available, 1) injury to an eagle, 2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or 3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior."

In addition to immediate impacts, this definition also covers impacts that result from human-induced alterations initiated around a previously used nest site during a time when eagles are not present, if, upon the eagle's return, such alterations agitate or bother an eagle to a degree that interferes with or interrupts normal breeding, feeding, or sheltering habits, and causes injury, death or nest abandonment.

California Department of Fish and Wildlife

The California Department of Fish and Wildlife (CDFW) derives its authority from the Fish and Game Code of California and administers several State laws protecting fish and wildlife resources and the habitats upon which they depend.

California Endangered Species Act

The CESA (Fish and Game Code Section 2050 et. seq.) prohibits take of state listed threatened or endangered. Take under CESA is defined as "Hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill" (Fish and Game Code sec. 86). This definition does not prohibit indirect harm by way of habitat modification, except where such harm is the proximate cause of death of a listed species. Where incidental take would occur during construction or other lawful activities, CESA allows the CDFW to issue an Incidental Take Permit upon finding, among other requirements, that impacts to the species have been minimized and fully mitigated. Unlike the federal ESA, CESA's protections extend to candidate species during the period (typically one year) while the California Fish and Game Commission decides whether the species warrants CESA listing.

Native Plant Protection Act

The CDFW also has authority to administer the Native Plant Protection Act (NPPA) (Fish and Game Code Section 1900 et seq.). The NPPA requires the CDFW to establish criteria for determining if a species, subspecies, or variety of native plant is endangered or rare, and prohibits the take of listed plant species. Effective in 2015, CDFW promulgated regulations (14 CCR 786.9) under the authority of the NPPA, establishing that the CESA's permitting procedures would be applied to plants listed under the NPPA as "Rare." With this change, there is little practical difference for the regulated public between plants listed under CESA and those listed under the NPPA.

Fully Protected Species Laws

The CDFW enforces Sections 3511, 4700, 5050, and 5515 of the Fish and Game Code, which prohibit take of species designated as Fully Protected. The CDFW is not allowed to issue an Incidental Take Permit for Fully Protected species; therefore, impacts to these species must be avoided. The exception is situations where a Natural Community Conservation Plan (NCCP) is in place that authorizes take of the fully protected species.

Avian Protection Laws

California Fish and Game Code sections 3503, 3503.5, and 3513 describe unlawful take, possession, or destruction of native birds, nests, and eggs. Section 3503.5 of the Code protects all birds-of-prey and their eggs and nests against take, possession, or destruction of nests or eggs. Section 3513 makes it a State-level offense to take any bird in violation of the federal Migratory Bird Treaty Act.

City of Santa Barbara

The Study Area occurs within the jurisdiction of the City of Santa Barbara. The General Plans and Municipal Codes of the City of Santa Barbara include goals, policies, and ordinances intended to protect, preserve and enhance natural habitats and biological resources to varying degrees, including trees, riparian areas, and water resources.

City General Plan Policies

The *Santa Barbara General Plan* (2011) has several policies in its Environmental Resources Element that would offer protection for biological resources in the Study Area:

- **ER11.** Native and Other Trees and Landscaping. Protect and maintain native and other urban trees, and landscaped spaces, and promote the use of native or Mediterranean drought-tolerant species in landscaping to save energy and water, incorporate habitat, and provide shade.
- **ER12.** Wildlife, Coastal and Native Plant Habitat Protection and Enhancement. Protect, maintain, and to the extent reasonably possible, expand the City's remaining diverse native plant and wildlife habitats, including ocean, wetland, coastal, creek, foothill, and urban-adapted habitats.
- **ER13.** Trail Management. Existing and future trails along creeks or in other natural settings shall be managed for both passive recreational use and as native species habitat and corridors.
- **ER15.** Creek Resources and Water Quality. Encourage development and infrastructure that is consistent with City policies and programs for comprehensive watershed planning, creeks restoration, water quality protection, open space enhancement, storm water management, and public creek and water awareness programs.

City of Santa Barbara Municipal Code

Chapter 15.20 and 14.56 are the biological resources ordinances of the Santa Barbara Municipal Code (SBMC) that pertain to this Project.

Chapter 15.20 of the SBMC requires a permit to "plant, prune, trim, perform maintenance on, or remove any tree planted in a parkway strip, tree well, public area or street right-of-way trees" in a City street ROW.

Chapter 14.56 of the SBMC includes ordinances related to the protection of natural watercourses and City storm drain systems, requiring a permit for activities that may:

- Discharge pollutants to a watercourse,
- Grade or place fill within a watercourse, or
- Construct within a watercourse (including the placement of structures, pipe, impervious material, or channel lining).

Chapter 14.56 mentions that the implementation of these ordinances will adhere to the applicable federal or state statute or regulation that allocates for the greatest protection of the environment.

Appendix B

Site Photographs

Photograph 1. Southwest facing view of the non-native grassland land cover type, located within the southwestern portion of the Vic Trace Reservoir.

Photograph 2. Northeast facing view of the developed/disturbed land cover type, located within the northern portion of the Vic Trace Reservoir.

Photograph 3. North facing view of the eucalyptus grove, located adjacent to the southwestern boundary of the constructed Vic Trace Reservoir.

Photograph 4. View facing northeast of iceplant mats and California sagebrush scrub on the Vic Trace Reservoir property.

Photograph 5. South facing view of lemonade berry scrub on hilltop with ice plant mats and non-native grassland in the foreground.

Photograph 6. Southeast facing view of the coast live oak woodland located in La Coronilla Park along the west aspect slope of the Vic Trace Reservoir.

Photograph 7. Southwest facing view of the potential new location of the La Vista Del Oceano PRV Vault at the southeast corner of Meigs Road and Dolores Drive.

Photograph 8. North facing view of the Exit pit location on La Vista Del Oceano (July 30, 2025).

Photograph 9. West facing view of the Entry pit located on Ricardo Ave (July 30, 2025).

Appendix C

Floral and Faunal Compendium

Plant and Wildlife Species Detected in the Study Area on July 13, 2023 and July 30, 2025

Scientific Name	Common Name	Status	Native or Introduced
Plants			
Acacia spp.	acacia		Introduced
Ambrosia psilostachya	ragweed		Native
Artemisia californica	California sagebrush		Native
Atriplex lentiformis	big saltbush		Native
Avena barbata	slender wild oat	Cal-IPC Moderate	Introduced
Baccharis pilularis	coyote brush		Native
Bromus diandrus	ripgut brome	Cal-IPC Moderate	Introduced
Bromus madritensis	foxtail brome		Introduced
Carduus pycnocephalus	Italian thistle	Cal-IPC Moderate	Introduced
Carpobrotus edulis	ice plant	Cal-IPC High	Introduced
Convolvulus arvensis	field bindweed		Introduced
Croton setiger	turkey-mullien		Native
Cynodon dactylon	Bermuda grass	Cal-IPC Moderate	Introduced
Datura wrightii	jimsonweed		Native
Deinandra fasciculata	clustered tarweed		Native
Delairea odorata	cape ivy	Cal-IPC High	Introduced
Ehrharta erecta	upright veldt grass	Cal-IPC Moderate	Introduced
Erigeron canadensis	Canada horseweed		Native
Eucalyptus sideroxylon	red iron bark		Native
Foeniculum vulgare	fennel	Cal-IPC Moderate	Introduced
Frangula californica	coffeeberry		Native
Hedera helix	English ivy	Cal-IPC High	Introduced
Heteromeles arbutifolia	toyon		Native
Hirschfeldia incana	short-podded mustard	Cal-IPC Moderate	Introduced
Hordeum murinum	foxtail barley	Cal-IPC Moderate	Introduced
Isocoma menziesii	Menzies' goldenbush		Native
Lactuca serriola	prickly lettuce		Introduced
Ligustrum lucidum	glossy privet	Cal-IPC Limited	Introduced
Lysimachia arvensis	scarlet pimpernel		Introduced
Malva parviflora	cheeseweed		Introduced
Melilotus indicus	annual yellow sweetclover		Introduced
Nicotiana glauca	tree tobacco	Cal-IPC Moderate	Introduced
Olea europaea	olive	Cal-IPC Limited	Introduced
Phoenix canariensis	Canary Island date palm	Cal-IPC Limited	Introduced
Pinus eldarica	Afghan pine		Introduced
Pinus pinea	Italian stone pine		Introduced
Pittosporum undulatum	Australian cheesewood		Native
Plantago lanceolata	English plantain	Cal-IPC Limited	Introduced

Scientific Name	Common Name	Status	Native or Introduced
Prunus ilicifolia	holly leaf cherry		Native
Pseudognaphalium californicum	ladies' tobacco		Native
Pyracantha coccinea	scarlet firethorn	Cal-IPC Limited	Introduced
Quercus agrifolia	coast live oak		Native
Raphanus sativus	wild radish	Cal-IPC Limited	Native
Rhus integrifolia	lemonade berry		Native
Ricinus communis	castor bean	Cal-IPC Limited	Introduced
Robinia pseudoacacia	black locust	Cal-IPC Limited	Introduced
Rubus armeniacus	Himalayan blackberry	Cal-IPC High	Introduced
Sambucus nigra ssp. *Caerulea*	blue elderberry		Native
Sisyrinchium bellum	blue eyed grass		Native
Solanum douglasii	Douglas' nightshade		Native
Sonchus arvensis	field sow thistle		Introduced
Stipa miliaceae	smilo grass	Cal-IPC Limited	Introduced
Toxicodendron diversilobum	poison oak		Native
Vicia sativa	spring vetch		Introduced
Yucca spp.	unknown		Introduced
Animals			
Invertebrates			
Danaus plexippus	western monarch butterfly	ESA Candidate	Native
Reptiles			
Elgaria multicarinata	southern alligator lizard		Native
Sceloporus occidentalis	western fence lizard		Native
Birds			
Accipiter cooperii	Cooper’s hawk	CDFW Watch List Species	Native
Aphelocoma californica	California scrub-jay		Native
Bubo virginianus	great horned owl		Native
Buteo jamaicensis	red-tailed hawk		Native
Calypte anna	Anna’s hummingbird		Native
Columba livia	rock pigeon		Introduced
Corvus brachyrhynchos	American crow		Native
Falco sparverius	American kestrel		Native
Haemorhous mexicanus	house finch		Native
Icterus cucullatus	hooded oriole		Native
Melospiza melodia	song sparrow		Native
Melozone crissalis	California towhee		Native
Mimus polyglottos	northern mockingbird		Native
Passer domesticus	house sparrow		Introduced
Pipilo maculatus	spotted towhee		Native
Psaltriparus minimus	bushtit		Native

Scientific Name	Common Name	Status	Native or Introduced
Sayornis nigricans	black phoebe		Native
Selasphorus sasin	Allen's hummingbird		Native
Streptopelia decaocto	Eurasian collared dove		Introduced
Mammals			
Sylvilagus bachmani	brush rabbit		Native
Thomomys bottae	Botta's pocket gopher		Native

This page intentionally left blank.

Appendix D

Special Status Species Evaluation Tables

Special-Status Species in the Regional Vicinity of the Study Area

Scientific Name Common Name	Status	Habitat Requirements	Potential to Occur in Study Area	Habitat Suitability/Observations
Plants and Lichens				
Amsinckia douglasiana Douglas' fiddleneck	None/None G4/S4 4.2 SBBG	Annual herb. Cismontane woodland, valley and foothill grassland. Dry. Elevations: 0-6400ft. (0-1950m.) Blooms Mar-May.	Low	Eucalyptus groves and landscape trees surrounded by open, disturbed, habitat is present within the Study Area, mimicking a natural woodland. However, the Study Area is actively mowed and contained a moderate degree of disturbance.
Arctostaphylos refugioensis Refugio manzanita	None/None G3/S3 1B.2 SBBG	Perennial evergreen shrub. Chaparral. On sandstone. Elevations: 900-2690ft. (274-820m.) Blooms (May)Dec-Mar.	None	No suitable habitat is present within the Study Area.
Astragalus didymocarpus var. *milesianus* Miles' milk-vetch	None/None G5T2/S2 1B.2	Annual herb. Coastal scrub. Clay soils. Elevations: 65-295ft. (20-90m.) Blooms Mar-Jun.	Low	Marginal quality coastal scrub patches are present within the Study Area. However, the Study Area contains a moderate degree of disturbance.
Atriplex coulteri Coulter's saltbush	None/None G3/S1S2 1B.2	Perennial herb. Coastal bluff scrub, coastal dunes, coastal scrub, valley and foothill grassland. Alkaline (sometimes), clay (sometimes). Elevations: 10-1510ft. (3-460m.) Blooms Mar-Oct.	None	No suitable habitat is present within the Study Area. This species is a perennial and was not observed during the field survey.
Atriplex serenana var. *davidsonii* Davidson's saltscale	None/None G5T1/S1 1B.2	Annual herb. Coastal bluff scrub, coastal scrub. Alkaline. Elevations: 35-655ft. (10-200m.) Blooms Apr-Oct.	None	No suitable habitat is present within the Study Area.
Calandrinia breweri Brewer's calandrinia	None/None G4/S4 4.2 SBBG	Annual herb. Chaparral, coastal scrub. Burned areas, disturbed areas, loam (sometimes), sandy (sometimes). Elevations: 35-4005ft. (10-1220m.) Blooms (Jan)Mar-Jun.	Low	Small patches of marginal coastal scrub habitat are present within the Study Area along with disturbed areas. However, the Study Area is completely isolated to all known remnant populations of this species and is frequently disturbed through mowing.

Scientific Name Common Name	Status	Habitat Requirements	Potential to Occur in Study Area	Habitat Suitability/Observations
Calochortus catalinae Catalina mariposa-lily	None/None G3G4/S3S4 4.2 SBBG	Perennial bulbiferous herb. Chaparral, cismontane woodland, coastal scrub, valley and foothill grassland. In heavy soils, open slopes, openings in brush. Elevations: 50-2295ft. (15-700m.) Blooms (Feb)Mar-Jun.	Low	Small patches of marginal coastal scrub are present within the Study Along with open slopes. However, the Study Area is completely isolated to all known remnant populations of this species and is frequently disturbed through mowing.
Calochortus fimbriatus late-flowered mariposa-lily	None/None G3/S3 1B.3 SBBG	Perennial bulbiferous herb. Chaparral, cismontane woodland, riparian woodland. Serpentinite (sometimes). Elevations: 900-6250ft. (275-1905m.) Blooms Jun-Aug.	None	Suitable soils are not present within the Study Area and the Study Area is outside of this species documented range.
Calochortus palmeri var. *palmeri* Palmer's mariposa-lily	None/None G3T2/S2 1B.2 SBBG	Perennial bulbiferous herb. Chaparral, lower montane coniferous forest, meadows and seeps. Mesic. Elevations: 2330-7840ft. (710-2390m.) Blooms Apr-Jul.	None	No suitable habitat is present within the Study Area.
Calystegia sepium ssp. *binghamiae* Santa Barbara morning-glory	None/None G5TXQ/SX 1A	Perennial rhizomatous herb. Marshes and swamps. Elevations: 15-15ft. (5-5m.) Blooms Aug.	None	No suitable habitat is present within the Study Area.
Centromadia parryi ssp. *australis* southern tarplant	None/None G3T2/S2 1B.1 SBBG	Annual herb. Marshes and swamps, valley and foothill grassland, vernal pools. Often in disturbed sites near the coast at marsh edges; also in alkaline soils sometimes with saltgrass. Sometimes on vernal pool margins. Elevations: 0-1575ft. (0-480m.) Blooms May-Nov.	None	No suitable habitat is present within the Study Area.
Chloropyron maritimum ssp. *maritimum* salt marsh bird's-beak	FE/SE G4?T1/S1 1B.2 SBBG	Annual herb (hemiparasitic). Coastal dunes, marshes and swamps. Limited to the higher zones of salt marsh habitat. Elevations: 0-100ft. (0-30m.) Blooms May-Oct(Nov).	None	No suitable habitat is present within the Study Area.
Chorizanthe palmeri Palmer's spineflower	None/None G4/S4 4.2 SBBG	Annual herb. Chaparral, cismontane woodland, valley and foothill grassland. Rocky, serpentinite. Elevations: 180-3100ft. (55-945m.) Blooms Apr-Aug.	None	No suitable habitat or soils are present within the Study Area.
Delphinium umbraculorum umbrella larkspur	None/None G3/S3 1B.3	Perennial herb. Chaparral, cismontane woodland. Mesic sites. Elevations: 1310-5250ft. (400-1600m.) Blooms Apr-Jun.	None	No suitable habitat is present within the Study Area and the Study Area is well outside of this species documented elevational range.

Scientific Name Common Name	Status	Habitat Requirements	Potential to Occur in Study Area	Habitat Suitability/Observations
Fritillaria ojaiensis Ojai fritillary	None/None G3/S3 1B.2 SBBG	Perennial bulbiferous herb. Broadleafed upland forest, chaparral, cismontane woodland, lower montane coniferous forest. Rocky sites. Sometimes on serpentine; sometimes along roadsides. Elevations: 740-3275ft. (225-998m.) Blooms Feb-May.	None	No suitable habitat is present within the Study Area and the Study Area is outside of this species documented elevational range.
Horkelia cuneata var. *puberula* mesa horkelia	None/None G4T1/S1 1B.1	Perennial herb. Chaparral, cismontane woodland, coastal scrub. Sandy or gravelly sites. Elevations: 230-2660ft. (70-810m.) Blooms Feb-Jul(Sep).	None	Small patches of coastal scrub is present within the Study Area; however, sandy or gravelly soils are generally lacking and this species is a perennial and was not observed during the field survey.
Juncus luciensis Santa Lucia dwarf rush	None/None G3/S3 1B.2	Annual herb. Chaparral, great basin scrub, lower montane coniferous forest, meadows and seeps, vernal pools. Vernal pools, ephemeral drainages, wet meadow habitats and streamsides. Elevations: 985-6695ft. (300-2040m.) Blooms Apr-Jul.	None	No suitable habitat is present within the Study Area and the Study Area is outside of this species documented elevational range.
Lasthenia conjugens Contra Costa goldfields	FE/None G1/S1 1B.1	Annual herb. Cismontane woodland, playas, valley and foothill grassland, vernal pools. Vernal pools, swales, low depressions, in open grassy areas. Elevations: 0-1540ft. (0-470m.) Blooms Mar-Jun.	None	No suitable habitat is present within the Study Area.
Lasthenia glabrata ssp. *coulteri* Coulter's goldfields	None/None G4T2/S2 1B.1 SBBG	Annual herb. Marshes and swamps, playas, vernal pools. Usually found on alkaline soils in playas, sinks, and grasslands. 1-. Elevations: 5-4005ft. (1-1220m.) Blooms Feb-Jun.	None	No suitable habitat is present within the Study Area.
Layia heterotricha pale-yellow layia	None/None G2/S2 1B.1 SBBG	Annual herb. Cismontane woodland, coastal scrub, pinyon and juniper woodland, valley and foothill grassland. Alkaline or clay soils; open areas. Elevations: 985-5595ft. (300-1705m.) Blooms Mar-Jun.	None	Suitable soils are lacking from the Study Area and the Study Area is outside of this species documented elevational range.
Lonicera subspicata var. *subspicata* Santa Barbara honeysuckle	None/None G5T2?/S2? 1B.2 SBBG	Perennial evergreen shrub. Chaparral, cismontane woodland, coastal scrub. Elevations: 35-3280ft. (10-1000m.) Blooms (Feb)May-Aug(Dec).	None	Some marginal quality coastal scrub habitat is present within the Study Area; however, this species is a perennial and was not observed during the field survey.

Scientific Name Common Name	Status	Habitat Requirements	Potential to Occur in Study Area	Habitat Suitability/Observations
Malacothrix saxatilis var. *arachnoidea* Carmel Valley malacothrix	None/None G5T2/S2 1B.2	Perennial rhizomatous herb. Chaparral, coastal scrub. Rock outcrops or steep rocky roadcuts. Elevations: 80-3400ft. (25-1036m.) Blooms (Mar)Jun-Dec.	None	Some marginal quality coastal scrub habitat is present within the Study Area; however, rocky outcrops are lacking, and this species is a perennial and was not observed during the field survey.
Monardella hypoleuca ssp. *hypoleuca* white-veined monardella	None/None G4T3/S3 1B.3 SBBG	Perennial herb. Chaparral, cismontane woodland. Dry slopes. Elevations: 165-5005ft. (50-1525m.) Blooms (Apr)May-Aug(Sep-Dec).	None	No suitable habitat is present within the Study Area and this species is a perennial and was not observed during the field survey.
Nasturtium gambelii Gambel's water cress	FE/ST G1/S1 1B.1 SBBG	Perennial rhizomatous herb. Marshes and swamps. Freshwater and brackish marshes at the margins of lakes and along streams, in or just above the water level. Elevations: 15-1085ft. (5-330m.) Blooms Apr-Oct.	None	No suitable habitat is present within the Study Area.
Pelazoneuron puberulum var. *sonorense* Sonoran maiden fern	None/None G5T3/S2 2B.2	Meadows and seeps. Along streams, seepage areas. 50-610m. Blooms Jan-Sep.	None	No suitable habitat is present within the Study Area.
Phacelia hubbyi Hubby's phacelia	None/None G4/S4 4.2 SBBG	Annual herb. Chaparral, coastal scrub, valley and foothill grassland. Gravelly, rocky areas and talus slopes. Elevations: 0-3280ft. (0-1000m.) Blooms Apr-Jul.	Low	Small patches of marginal quality coastal scrub and grassland habitat are present within the Study Area; however, rocky areas and talus slopes are absent.
Pleuridium mexicanum Mexican earthmoss	None/None G5/S1 2B.1	Moss. Chaparral. Sandstone. Elevations: 1445-1445ft. (440-440m.)	None	No suitable habitat is present within the Study Area.
Quercus dumosa Nuttall's scrub oak	None/None G3/S3 1B.1	Perennial evergreen shrub. Chaparral, closed-cone coniferous forest, coastal scrub. Generally on sandy soils near the coast; sometimes on clay loam. Elevations: 50-1310ft. (15-400m.) Blooms Feb-Apr(May-Aug).	None	No suitable habitat is present within the Study Area.
Sanicula hoffmannii Hoffmann's sanicle	None/None G3/S3 4.3 SBBG	Perennial herb. Broadleafed upland forest, chaparral, cismontane woodland, coastal bluff scrub, coastal scrub, lower montane coniferous forest. Cool slopes in deep soil, often in moist shaded serpentine soils, or in clay soils. Elevations: 100-985ft. (30-300m.) Blooms Mar-May.	None	No suitable habitat is present within the Study Area and this species is a perennial and was not observed during the field survey.

Scientific Name Common Name	Status	Habitat Requirements	Potential to Occur in Study Area	Habitat Suitability/Observations
Scrophularia atrata black-flowered figwort	None/None G2?/S2? 1B.2	Perennial herb. Chaparral, closed-cone coniferous forest, coastal dunes, coastal scrub, riparian scrub. Sand, diatomaceous shales, and soils derived from other parent material; around swales and in sand dunes. Elevations: 35-1640ft. (10-500m.) Blooms Mar-Jul.	None	No suitable habitat is present within the Study Area.
Suaeda esteroa estuary seablite	None/None G3/S2 1B.2	Perennial herb. Marshes and swamps. Coastal salt marshes in clay, silt, and sand substrates. Elevations: 0-15ft. (0-5m.) Blooms (Jan-May)Jul-Oct.	None	No suitable habitat is present within the Study Area.
Thermopsis macrophylla Santa Ynez false lupine	None/SR G1/S1 1B.3 SBBG	Perennial rhizomatous herb. Chaparral. In open areas such as fuel breaks, after burns; on sandstone. Elevations: 1395-4595ft. (425-1400m.) Blooms Apr-Jun.	None	No suitable habitat is present within the Study Area. The Study Area is outside of this species' known elevational range.
Animals				
Invertebrates				
Bombus crotchii Crotch bumble bee	None/SCE G2/S2	Coastal California east to the Sierra-Cascade crest and south into Mexico. Food plant genera include Antirrhinum, Phacelia, Clarkia, Dendromecon, Eschscholzia, and Eriogonum.	None	The Study Area is within this species' known geographic range. However, the Study Area is surrounded by a development, the species preferred diet plants were not detected within the Study Area, and the Study Area appears to be actively mowed and is disturbed.

Scientific Name Common Name	Status	Habitat Requirements	Potential to Occur in Study Area	Habitat Suitability/Observations
Danaus plexippus plexippus pop. 1 monarch - California overwintering population	FC/None G4T1T2Q/S2	Winter roost sites extend along the coast from northern Mendocino to Baja California, Mexico. Roosts located in wind-protected tree groves (eucalyptus, Monterey pine, cypress), with nectar and water sources nearby.	None (Roosting)	Eucalyptus groves are present within the Study Area. However, they are too small to provide adequate shelter for roosting monarchs, they are a different species of eucalyptus tree (*Eucalyptus sideroxylon*) than the monarchs' preferred roosting tree (i.e., *Eucalyptus globulus*) and nearby nectar and water sources are generally absent. One transient monarch was observed during the site survey but it was likely a transient moving through the Study Area. The site survey was conducted outside of the monarch overwintering/roosting season.
Fish				
Eucyclogobius newberryi tidewater goby	FE/None G3/S3	Brackish water habitats along the California coast from Agua Hedionda Lagoon, San Diego County to the mouth of the Smith River. Found in shallow lagoons and lower stream reaches, they need fairly still but not stagnant water and high oxygen levels.	None	No suitable habitat is present within the Study Area.
Oncorhynchus mykiss irideus pop. 10 steelhead - southern California DPS	FE/SCE G5T1Q/S1	Federal listing refers to populations from Santa Maria River south to southern extent of range (San Mateo Creek in San Diego County). Southern steelhead likely have greater physiological tolerances to warmer water and more variable conditions.	None	No suitable habitat is present within the Study Area.
Amphibians				
Anaxyrus californicus arroyo toad	FE/None G2G3/S2 SSC	Semi-arid regions near washes or intermittent streams, including valley-foothill and desert riparian, desert wash, etc. Rivers with sandy banks, willows, cottonwoods, and sycamores; loose, gravelly areas of streams in drier parts of range.	None	No suitable habitat is present within the Study Area.

Scientific Name Common Name	Status	Habitat Requirements	Potential to Occur in Study Area	Habitat Suitability/Observations
Rana boylii pop. 6 foothill yellow-legged frog - south coast DPS	SE G3T1/S1	Southern Coast Ranges from Monterey Bay south through San Gabriel Mountains; west of the Salinas River in Monterey Co, south through Transverse Ranges, and east through San Gabriel Mountains. Historically may have ranged to Baja California. Partly shaded shallow streams and riffles with a rocky substrate in a variety of habitats. Needs at least some cobble-sized substrate for egg-laying and at least 15 weeks to attain metamorphosis.	None	No suitable habitat is present within the Study Area.
Rana draytonii California red-legged frog	FT/None G2G3/S2S3 SSC	Lowlands and foothills in or near permanent sources of deep water with dense, shrubby or emergent riparian vegetation. Requires 11-20 weeks of permanent water for larval development. Must have access to estivation habitat.	None	No suitable habitat is present within the Study Area.
Taricha torosa Coast Range newt	None/None G4/S4 SSC	Coastal drainages from Mendocino County to San Diego County. Lives in terrestrial habitats and will migrate over 1 km to breed in ponds, reservoirs and slow moving streams.	None	No suitable habitat is present within the Study Area.
Reptiles				
Anniella pulchra Northern California legless lizard	None/None G3/S2S3 SSC	Sandy or loose loamy soils under sparse vegetation. Soil moisture is essential. They prefer soils with a high moisture content.	None	Sandy and loose soils and sparse vegetative duff coverage are generally lacking from the Study Area. Furthermore, the Study Area is highly exposed and likely lacks soils with a high moisture content.
Anniella spp. California legless lizard	None/None G3G4/S3S4 SSC	Contra Costa County south to San Diego, within a variety of open habitats. This element represents California records of Anniella not yet assigned to new species within the Anniella pulchra complex. Variety of habitats; generally in moist, loose soil. They prefer soils with a high moisture content.	None	Sandy and loose soils and sparse vegetative duff coverage are generally lacking from the Study Area. Furthermore, the Study Area is highly exposed and likely lacks soils with a high moisture content.
Aspidoscelis tigris stejnegeri coastal whiptail	None/None G5T5/S3 SSC	Found in deserts and semi-arid areas with sparse vegetation and open areas. Also found in woodland and riparian areas. Ground may be firm soil, sandy, or rocky.	Low	There are open areas, woodland habitat, and sparse vegetation within the Study Area; however, the Study Area is within an urban setting is heavily disturbed.

Scientific Name Common Name	Status	Habitat Requirements	Potential to Occur in Study Area	Habitat Suitability/Observations
Emys marmorata western pond turtle	None/None G3G4/S3 SSC	A thoroughly aquatic turtle of ponds, marshes, rivers, streams and irrigation ditches, usually with aquatic vegetation, below 6000 ft elevation. Needs basking sites and suitable (sandy banks or grassy open fields) upland habitat up to 0.5 km from water for egg-laying.	None	No suitable habitat is present within the Study Area.
Phrynosoma blainvillii coast horned lizard	None/None G4/S4 SSC	Frequents a wide variety of habitats, most common in lowlands along sandy washes with scattered low bushes. Open areas for sunning, bushes for cover, patches of loose soil for burial, and abundant supply of ants and other insects.	Low	This species' preferred habitat is absent from the Study Area and the Study Area is located within an urban setting and heavily disturbed.
Salvadora hexalepis virgultea coast patch-nosed snake	None/None G5T4/S3 SSC	Brushy or shrubby vegetation in coastal Southern California. Require small mammal burrows for refuge and overwintering sites.	Low	Marginal quality shrubby habitat is located within the Study Area, small mammal burrows were observed, and the Study Area is located within this species documented geographic range. However, the Study Area is located within an urban setting and is heavily disturbed.
Thamnophis hammondii two-striped gartersnake	None/None G4/S3S4 SSC	Coastal California from vicinity of Salinas to northwest Baja California. From sea to about 7,000 ft elevation. Highly aquatic, found in or near permanent fresh water. Often along streams with rocky beds and riparian growth.	None	No suitable habitat is present within the Study Area.
Birds				
Agelaius tricolor tricolored blackbird	None/ST G1G2/S2 SSC	Highly colonial species, most numerous in Central Valley and vicinity. Largely endemic to California. Requires open water, protected nesting substrate, and foraging area with insect prey within a few km of the colony.	None	No suitable habitat is present within the Study Area.
Ammodramus savannarum grasshopper sparrow	None/None G5/S3 SSC	Dense grasslands on rolling hills, lowland plains, in valleys and on hillsides on lower mountain slopes. Favors native grasslands with a mix of grasses, forbs and scattered shrubs. Loosely colonial when nesting.	None	No suitable habitat is present within the Study Area.

Scientific Name Common Name	Status	Habitat Requirements	Potential to Occur in Study Area	Habitat Suitability/Observations
Aquila chrysaetos golden eagle	None/None G5/S3 FP WL	Rolling foothills, mountain areas, sage-juniper flats, and desert. Cliff-walled canyons provide nesting habitat in most parts of range; also, large trees in open areas.	None	No suitable habitat is present within the Study Area.
Athene cunicularia burrowing owl	None/None G4/S2 SSC	Open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably, the California ground squirrel.	None	No suitable habitat is present within the Study Area. No sign was observed during the field survey.
Charadrius nivosus nivosus western snowy plover	FT/None G3T3/S3 SSC	Sandy beaches, salt pond levees and shores of large alkali lakes. Needs sandy, gravelly or friable soils for nesting.	None	No suitable habitat is present within the Study Area.
Coturnicops noveboracensis yellow rail	None/None G4/S2 SSC	Summer resident in eastern Sierra Nevada in Mono County. Freshwater marshlands.	None	No suitable habitat is present within the Study Area.
Elanus leucurus white-tailed kite	None/None G5/S3S4 FP	Rolling foothills and valley margins with scattered oaks and river bottomlands or marshes next to deciduous woodland. Open grasslands, meadows, or marshes for foraging close to isolated, dense-topped trees for nesting and perching.	Moderate	The Study Area is located on top of a rolling hill and contains and is surrounded by scattered oaks and other trees suitable as nesting and perching habitat. The Study Area contains open foraging habitat and suitable prey species. However, the Study Area is surrounded by developed habitat and is disturbed.
Empidonax traillii extimus southwestern willow flycatcher	FE/SE G5T2/S3	Riparian woodlands in Southern California.	None	No suitable habitat is present within the Study Area.
Gymnogyps californianus California condor	FE/SE G1/S2 FP	Require vast expanses of open savannah, grasslands, and foothill chaparral in mountain ranges of moderate altitude. Deep canyons containing clefts in the rocky walls provide nesting sites. Forages up to 100 miles from roost/nest.	None	No suitable habitat is present within the Study Area.

Scientific Name Common Name	Status	Habitat Requirements	Potential to Occur in Study Area	Habitat Suitability/Observations
Laterallus jamaicensis coturniculus California black rail	None/ST G3T1/S2 FP	Inhabits freshwater marshes, wet meadows and shallow margins of saltwater marshes bordering larger bays. Needs water depths of about 1 inch that do not fluctuate during the year and dense vegetation for nesting habitat.	None	No suitable habitat is present within the Study Area.
Passerculus sandwichensis beldingi Belding's savannah sparrow	None/SE G5T3/S3	Inhabits coastal salt marshes, from Santa Barbara south through San Diego County. Nests in Salicornia on and about margins of tidal flats.	None	No suitable habitat is present within the Study Area.
Pelecanus occidentalis californicus California brown pelican	FD/SD G4T3T4/S3 FP	Colonial nester on coastal islands just outside the surf line. Nests on coastal islands of small to moderate size which afford immunity from attack by ground-dwelling predators. Roosts communally.	None	No suitable habitat is present within the Study Area.
Rallus obsoletus levipes light-footed Ridgway's rail	FE/SE G3T1T2/S1 FP	Found in salt marshes traversed by tidal sloughs, where cordgrass and pickleweed are the dominant vegetation. Requires dense growth of either pickleweed or cordgrass for nesting or escape cover; feeds on mollusks and crustaceans.	None	No suitable habitat is present within the Study Area.
Riparia riparia bank swallow	None/ST G5/S3	Colonial nester; nests primarily in riparian and other lowland habitats west of the desert. Requires vertical banks/cliffs with fine-textured/sandy soils near streams, rivers, lakes, ocean to dig nesting hole.	None	No suitable habitat is present within the Study Area.
Sternula antillarum browni California least tern	FE/SE G4T2T3Q/S2 FP	Nests along the coast from San Francisco Bay south to northern Baja California. Colonial breeder on bare or sparsely vegetated, flat substrates: sand beaches, alkali flats, landfills, or paved areas.	None	No suitable habitat is present within the Study Area.
Vireo bellii pusillus least Bell's vireo	FE/SE G5T2/S3	Summer resident of Southern California in low riparian in vicinity of water or in dry river bottoms; below 2000 ft. Nests placed along margins of bushes or on twigs projecting into pathways, usually willow, Baccharis, mesquite.	None	No suitable habitat is present within the Study Area.

Scientific Name Common Name	Status	Habitat Requirements	Potential to Occur in Study Area	Habitat Suitability/Observations
Mammals				
Antrozous pallidus pallid bat	None/None G4/S3 SSC	Found in a variety of habitats including deserts, grasslands, shrublands, woodlands, and forests. Most common in open, dry habitats with rocky areas for roosting. Roosts in crevices of rock outcrops, caves, mine tunnels, buildings, bridges, and hollows of live and dead trees which must protect bats from high temperatures. Very sensitive to disturbance of roosting sites.	None	No suitable roosting habitat is present within the Study Area and the Study Area is within a urban/developed area and this species is very sensitive to disturbance of roosting sites.
Corynorhinus townsendii Townsend's big-eared bat	None/None G4/S2 SSC	Occurs throughout California in a wide variety of habitats. Most common in mesic sites, typically coniferous or deciduous forests. Roosts in the open, hanging from walls & ceilings in caves, lava tubes, bridges, and buildings. This species is extremely sensitive to human disturbance.	None	No suitable roosting habitat is present within the Study Area and the Study Area is within a urban/developed area and this species is very sensitive to disturbance of roosting sites.
Eumops perotis californicus western mastiff bat	None/None G4G5T4/S3S4 SSC	Occurs in open, semi-arid to arid habitats, including coniferous and deciduous woodlands, coastal scrub, grasslands, and chaparral. Roosts in crevices in cliff faces and caves, and buildings. Roosts typically occur high above ground.	None	No suitable roosting habitat is present within the Study Area.
Lasiurus frantzii western red bat	None/None G4/S3 SSC	Roosts primarily in trees, 2-40 ft above ground, from sea level up through mixed conifer forests. Prefers habitat edges and mosaics with trees that are protected from above and open below with open areas for foraging.	Low	Marginal quality habitat is present within the Study Area; however, this species requires access to water and is typically found near freshwater, and that is absent from the Study Area.
Neotoma lepida intermedia San Diego desert woodrat	None/None G5T3T4/S3S4 SSC	Occurs in scrub habitats of southern California from San Luis Obispo County to San Diego County.	None	Marginal quality scrub habitat is present within the Study Area; however, no woodrat middens were observed during the field survey.
Nyctinomops macrotis big free-tailed bat	None/None G5/S3 SSC	Low-lying arid areas in Southern California. Need high cliffs or rocky outcrops for roosting sites. Feeds principally on large moths.	None	No suitable habitat is present within the Study Area.

Scientific Name Common Name	Status	Habitat Requirements	Potential to Occur in Study Area	Habitat Suitability/Observations

ft. = feet; meter = m.

Regional Vicinity refers to within a 9-quad search radius of site.

Status (Federal/State)

FE = Federal Endangered
FT = Federal Threatened
FPE = Federal Proposed Endangered
FPT = Federal Proposed Threatened
FD = Federal Delisted
FC = Federal Candidate
SE = State Endangered
ST = State Threatened
SCE = State Candidate Endangered
SCT = State Candidate Threatened
SR = State Rare
SD = State Delisted
SSC = CDFW Species of Special Concern
FP = CDFW Fully Protected
MMPA = Marine Mammal Protection Act
WL = CDFW Watch List

CRPR (CNPS California Rare Plant Rank)

1A = Presumed extirpated in California, and rare or extinct elsewhere
1B = Rare, Threatened, or Endangered in California and elsewhere
2A = Presumed extirpated in California, but common elsewhere
2B= Rare, Threatened, or Endangered in California, but more common elsewhere

CRPR Threat Code Extension

.1 = Seriously endangered in California (>80% of occurrences threatened/high degree and immediacy of threat)
.2 = Moderately threatened in California (20-80% of occurrences threatened/moderate degree and immediacy of threat)
.3 = Not very endangered in California (<20% of occurrences threatened/low degree and immediacy of threat)

Other Statuses

G1 or S1 Critically Imperiled Globally or Subnationally (state)
G2 or S2 Imperiled Globally or Subnationally (state)
G3 or S3 Vulnerable to extirpation or extinction Globally or Subnationally (state)
G4/5 or S4/5 Apparently secure, common and abundant
GH or SH Possibly Extirpated – missing; known from only historical occurrences but still some hope of rediscovery
SBBG Santa Barbara Botanic Garden Rare Plant

Additional notations may be provided as follows

T – Intraspecific Taxon (subspecies, varieties, and other designations below the level of species)
Q – Questionable taxonomy that may reduce conservation priority
? – Inexact numeric rank

Appendix E

Information for Planning and Consultation List

IPaC **U.S. Fish & Wildlife Service**

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

Location

Santa Barbara County, California

Local office

Ventura Fish And Wildlife Office

(805) 644-1766
(805) 644-3958
FW8VenturaSection7@FWS.Gov

2493 Portola Road, Suite B
Ventura, CA 93003-7726

https://www.fws.gov/Ventura

NOT FOR CONSULTATION

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information. IPaC only shows species that are regulated by USFWS (see FAQ).
2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Birds

NAME	STATUS
California Condor Gymnogyps californianus There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/8193	Endangered
California Least Tern Sternula antillarum browni Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/8104	Endangered
Least Bell's Vireo Vireo bellii pusillus Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/5945	Endangered
Western Snowy Plover Charadrius nivosus nivosus There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/8035	Threatened
Yellow-billed Cuckoo Coccyzus americanus There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/3911	Threatened

NOT FOR CONSULTATION

Reptiles

NAME	STATUS
Southwestern Pond Turtle Actinemys pallida Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/4768	Proposed Threatened

Amphibians

NAME	STATUS
California Red-legged Frog Rana draytonii Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/2891	Threatened
Foothill Yellow-legged Frog Rana boylii There is **proposed** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/5133	Endangered

Fishes

NAME	STATUS
Tidewater Goby Eucyclogobius newberryi Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/57	Endangered

Insects

NAME	STATUS
Monarch Butterfly Danaus plexippus Wherever found There is **proposed** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/9743	Proposed Threatened

Crustaceans

NAME	STATUS
Vernal Pool Fairy Shrimp Branchinecta lynchi Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/498	Threatened

Flowering Plants

NAME	STATUS
Salt Marsh Bird's-beak Cordylanthus maritimus ssp. maritimus Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/6447	Endangered

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

There are no critical habitats at this location.

You are still required to determine if your project(s) may have effects on all above listed species.

NOT FOR CONSULTATION

Bald & Golden Eagles

Bald and Golden Eagles are protected under the Bald and Golden Eagle Protection Act [2] and the Migratory Bird Treaty Act (MBTA) [1]. Any person or organization who plans or conducts activities that may result in impacts to Bald or Golden Eagles, or their habitats, should follow appropriate regulations and consider implementing appropriate avoidance and minimization measures, as described in the various links on this page.

Additional information can be found using the following links:

- Eagle Management https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide avoidance and minimization measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf
- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

There are Bald Eagles and/or Golden Eagles in your project area.

Measures for Proactively Minimizing Eagle Impacts
For information on how to best avoid and minimize disturbance to nesting bald eagles, please review the National Bald Eagle Management Guidelines. You may employ the timing and activity-specific distance recommendations in this document when designing your project/activity to avoid and minimize eagle impacts. For bald eagle information specific to Alaska, please refer to Bald Eagle Nesting and Sensitivity to Human Activity.

The FWS does not currently have guidelines for avoiding and minimizing disturbance to nesting Golden Eagles. For site-specific recommendations regarding nesting Golden Eagles, please consult with the appropriate Regional Migratory Bird Office or Ecological Services Field Office.

If disturbance or take of eagles cannot be avoided, an incidental take permit may be available to authorize any take that results from, but is not the purpose of, an otherwise lawful activity. For assistance making this determination for Bald Eagles, visit the Do I Need A Permit Tool. For assistance making this determination for golden eagles, please consult with the appropriate Regional Migratory Bird Office or Ecological Services Field Office.

Ensure Your Eagle List is Accurate and Complete
If your project area is in a poorly surveyed area in IPaC, your list may not be complete and you may need to rely on other resources to determine what species may be present (e.g. your local FWS field office, state surveys, your own surveys). Please review the Supplemental Information on Migratory Birds and Eagles, to help you properly interpret the report for your specified location, including determining if there is sufficient data to ensure your list is accurate.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to bald or golden eagles on your list, see the "Probability of Presence Summary" below to see when these bald or golden eagles are most likely to be present and breeding in your project area.

Review the FAQs
The FAQs below provide important additional information and resources.

NAME	BREEDING SEASON
Bald Eagle Haliaeetus leucocephalus This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1626	Breeds Jan 1 to Aug 31
Golden Eagle Aquila chrysaetos This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1680	Breeds Jan 1 to Aug 31

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read "Supplemental Information on Migratory Birds and Eagles", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

NOT FOR CONSULTATION

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

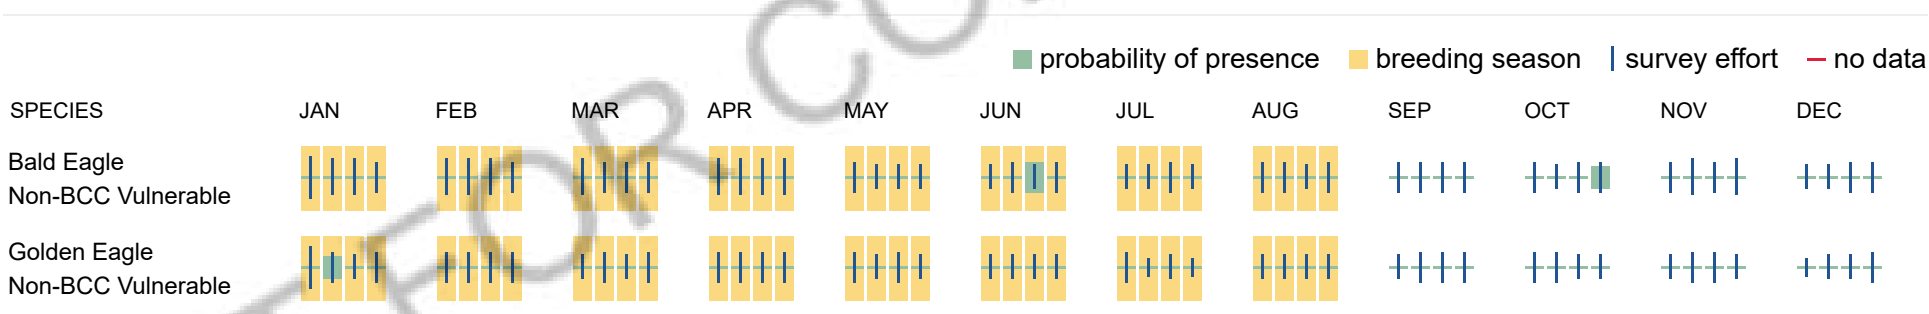
Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.



NOT FOR CONSULTATION

Bald & Golden Eagles FAQs

What does IPaC use to generate the potential presence of bald and golden eagles in my specified location?

The potential for eagle presence is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are an eagle (Bald and Golden Eagle Protection Act requirements may apply).

Proper interpretation and use of your eagle report
On the graphs provided, please look carefully at the survey effort (indicated by the black vertical line) and for the existence of the "no data" indicator (a red horizontal line). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort line or no data line (red horizontal) means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list and associated information help you know what to look for to confirm presence and helps guide you in knowing when to implement avoidance and minimization measures to eliminate or reduce potential impacts from your project activities or get the appropriate permits should presence be confirmed.

How do I know if eagles are breeding, wintering, or migrating in my area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating, or resident), you may query your location using the RAIL Tool and view the range maps provided for birds in your area at the bottom of the profiles provided for each bird in your results. If an eagle on your IPaC migratory bird species list has a breeding season associated with it (indicated by yellow vertical bars on the phenology graph in your “IPaC PROBABILITY OF PRESENCE SUMMARY” at the top of your results list), there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

Interpreting the Probability of Presence Graphs

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. A taller bar indicates a higher probability of species presence. The survey effort can be used to establish a level of confidence in the presence score.

How is the probability of presence score calculated? The calculation is done in three steps:

The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.

To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.

The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

Breeding Season ()
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort ()
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

No Data ()
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

Migratory birds

The Migratory Bird Treaty Act (MBTA) [1] prohibits the take (including killing, capturing, selling, trading, and transport) of protected migratory bird species without prior authorization by the Department of Interior U.S. Fish and Wildlife Service (Service).

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Eagle Management https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide avoidance and minimization measures for birds
- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

Measures for Proactively Minimizing Migratory Bird Impacts

Your IPaC Migratory Bird list showcases birds of concern, including Birds of Conservation Concern (BCC), in your project location. This is not a comprehensive list of all birds found in your project area. However, you can help proactively minimize significant impacts to all birds at your project location by implementing the measures in the Nationwide avoidance and minimization measures for birds document, and any other project-specific avoidance and minimization measures suggested at the link Measures for avoiding and minimizing impacts to birds for the birds of concern on your list below.

Ensure Your Migratory Bird List is Accurate and Complete

If your project area is in a poorly surveyed area, your list may not be complete and you may need to rely on other resources to determine what species may be present (e.g. your local FWS field office, state surveys, your own surveys). Please review the Supplemental Information on Migratory Birds and Eagles document, to help you properly interpret the report for your specified location, including determining if there is sufficient data to ensure your list is accurate.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, see the "Probability of Presence Summary" below to see when these birds are most likely to be present and breeding in your project area.

Review the FAQs
The FAQs below provide important additional information and resources.

NAME	BREEDING SEASON
Allen's Hummingbird Selasphorus sasin This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9637	Breeds Feb 1 to Jul 15

NOT FOR CONSULTATION

Bald Eagle Haliaeetus leucocephalus — Breeds Jan 1 to Aug 31
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/1626

Belding's Savannah Sparrow Passerculus sandwichensis beldingi — Breeds Apr 1 to Aug 15
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/8

Black Oystercatcher Haematopus bachmani — Breeds Apr 15 to Oct 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9591

Black Skimmer Rynchops niger — Breeds May 20 to Sep 15
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/5234

Black Swift Cypseloides niger — Breeds Jun 15 to Sep 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/8878

Black Tern Chlidonias niger surinamenisis — Breeds May 15 to Aug 20
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3093

Black Turnstone Arenaria melanocephala — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Black-chinned Sparrow Spizella atrogularis — Breeds Apr 15 to Jul 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9447

Brandt's Cormorant Urile penicillatus — Breeds Apr 15 to Sep 15
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Bullock's Oriole Icterus bullockii — Breeds Mar 21 to Jul 25
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA

California Gull Larus californicus — Breeds Mar 1 to Jul 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

California Thrasher Toxostoma redivivum — Breeds Jan 1 to Jul 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Clark's Grebe Aechmophorus clarkii — Breeds Jun 1 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Common Yellowthroat Geothlypis trichas sinuosa — Breeds May 20 to Jul 31
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/2084

NOT FOR CONSULTATION

Elegant Tern Thalasseus elegans — Breeds Apr 5 to Aug 5
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/8561

Golden Eagle Aquila chrysaetos — Breeds Jan 1 to Aug 31
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/1680

Heermann's Gull Larus heermanni — Breeds Mar 15 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Lawrence's Goldfinch Spinus lawrencei — Breeds Mar 20 to Sep 20
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9464

Marbled Godwit Limosa fedoa — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9481

Mountain Plover Charadrius montanus — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3638

Northern Harrier Circus hudsonius — Breeds Apr 1 to Sep 15
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/8350

Nuttall's Woodpecker Dryobates nuttallii — Breeds Apr 1 to Jul 20
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9410

Oak Titmouse Baeolophus inornatus — Breeds Mar 15 to Jul 15
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9656

Olive-sided Flycatcher Contopus cooperi — Breeds May 20 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3914

Red Knot Calidris canutus roselaari — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/8880

Santa Barbara Song Sparrow Melospiza melodia graminea — Breeds Mar 1 to Sep 5
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/5513

Short-billed Dowitcher Limnodromus griseus — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9480

NOT FOR CONSULTATION

Tricolored Blackbird Agelaius tricolor — Breeds Mar 15 to Aug 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3910

Western Grebe Aechmophorus occidentalis — Breeds Jun 1 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/6743

Western Gull Larus occidentalis — Breeds Apr 21 to Aug 25
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Western Screech-owl Megascops kennicottii cardonensis — Breeds Mar 1 to Jun 30
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA

Willet Tringa semipalmata — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Wrentit Chamaea fasciata — Breeds Mar 15 to Aug 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read "Supplemental Information on Migratory Birds and Eagles", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (▪)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

Migratory Bird FAQs

Tell me more about avoidance and minimization measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Avoidance & Minimization Measures for Birds describes measures that can help avoid and minimize impacts to all birds at any location year-round. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is one of the most effective ways to minimize impacts. To see when birds are most likely to occur and breed in your project area, view the Probability of Presence Summary. Additional measures or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the list of migratory birds that potentially occur in my specified location?

The Migratory Bird Resource List is comprised of Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location, such as those listed under the Endangered Species Act or the Bald and Golden Eagle Protection Act and those species marked as “Vulnerable”. See the FAQ “What are the levels of concern for migratory birds?” for more information on the levels of concern covered in the IPaC migratory bird species list.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) with which your project intersects. These species have been identified as warranting special attention because they are BCC species in that area, an eagle (Bald and Golden Eagle Protection Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, and to verify survey effort when no results present, please visit the Rapid Avian Information Locator (RAIL) Tool.

Why are subspecies showing up on my list?

Subspecies profiles are included on the list of species present in your project area because observations in the AKN for **the species** are being detected. If the species are present, that means that the subspecies may also be present. If a subspecies shows up on your list, you may need to rely on other resources to determine if that subspecies may be present (e.g. your local FWS field office, state surveys, your own surveys).

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets.

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go to the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering, or migrating in my area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating, or resident), you may query your location using the RAIL Tool and view the range maps provided for birds in your area at the bottom of the profiles provided for each bird in your results. If a bird on your IPaC migratory bird species list has a breeding season associated with it (indicated by yellow vertical bars on the phenology graph in your “IPaC PROBABILITY OF PRESENCE SUMMARY” at the top of your results list), there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Bald and Golden Eagle Protection Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially BCC species. For more information on avoidance and minimization measures you can implement to help avoid and minimize migratory bird impacts, please see the FAQ “Tell me more about avoidance and minimization measures I can implement to avoid or minimize impacts to migratory birds”.

Details about birds that are potentially affected by offshore projects

NOT FOR CONSULTATION

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Proper interpretation and use of your migratory bird report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please look carefully at the survey effort (indicated by the black vertical line) and for the existence of the "no data" indicator (a red horizontal line). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list does not represent all birds present in your project area. It is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list and associated information help you know what to look for to confirm presence and helps guide implementation of avoidance and minimization measures to eliminate or reduce potential impacts from your project activities, should presence be confirmed. To learn more about avoidance and minimization measures, visit the FAQ "Tell me about avoidance and minimization measures I can implement to avoid or minimize impacts to migratory birds".

Interpreting the Probability of Presence Graphs

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. A taller bar indicates a higher probability of species presence. The survey effort can be used to establish a level of confidence in the presence score.

How is the probability of presence score calculated? The calculation is done in three steps:

The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.

To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.

The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

Breeding Season ()

Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort ()

Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

No Data ()

A week is marked as having no data if there were no survey events for that week.

Survey Timeframe

Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

There are no refuge lands at this location.

Fish hatcheries

There are no fish hatcheries at this location.

Wetlands in the National Wetlands Inventory (NWI)

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

NOT FOR CONSULTATION

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

This location did not intersect any wetlands mapped by NWI.

NOTE: This initial screening does **not** replace an on-site delineation to determine whether wetlands occur. Additional information on the NWI data is provided below.

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate Federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

Staff Resumes

Elizabeth Shoemaker

Biologist II

Elizabeth has helped support many different projects with biological monitoring, pre-construction surveys, nesting bird and special-status wildlife and plant surveys, and reporting. Elizabeth has helped prepare biological reports that include daily and monthly monitoring reports, a nesting bird management monitoring and reporting plan, and biological resources assessments. In addition, Elizabeth has experience conducting protocol-level Crotch's bumble bee surveys and identifying bumble bee species/casts and has experience performing bird nest and bat surveys.

SELECT PROJECT EXPERIENCE

Biologist, NextEra – Roadhouse BESS, Ontario
Elizabeth helped conduct a field reconnaissance survey of the project site for a battery energy storage system (BESS) project. She surveyed for special status species, suitable habitats for special status species, and protected vegetative communities. In addition, she helped draft a Biological Resource Assessment of the project area and determine the potential to occur of special status species within the study area.

Biologist, Metrolink – Lancaster Metrolink Station NBMP, Lancaster
Elizabeth drafted a Nesting Bird Management, Monitoring, and Reporting Plan for the Lancaster Metrolink Station. Within this plan she outlined avoidance and minimization measures needed for the project to minimize potential project-related impacts to nesting birds.

Biological Monitor, City of Goleta – Ellwood Hazardous fuels, Goleta
Elizabeth monitored vegetation and tree removal activities throughout the Ellwood area. Daily activities included making sure the crew stayed out of jurisdictional areas, no work within overwintering monarch boundaries, keeping a daily log, and flagging native resources for avoidance

.

Biologist, Santa Barbara Public Works – East Beach Restoration Project, Santa Barbara
Elizabeth helped monitor the restoration efforts for the East Beach Restoration Project. These efforts included flagging in the restoration areas, seed sorting, and plant identification. Additionally, Elizabeth assisted with drafting a monthly monitoring report that outlined restoration efforts conducted in the month of March.

Biologist, City of Goleta – Goleta City of Public Works Ellwood MBHMP, Goleta
Elizabeth helped survey the Ellwood area for the Monarch Butterfly Habitat Management Program (MBHMP) for both the 2023/24 and 2024/25 overwintering seasons. These surveys consisted of collecting data on the environmental

conditions, tree/cluster location, and the number of butterflies observed in the Ellwood survey areas. In addition, Elizabeth drafted the annual monarch survey report for the 2023-24 overwintering season. This report summarized the data collected on the Ellwood monarch butterflies in the 2023-24 overwintering season and reflected on trends in monarch counts in past seasons.

Crotch's Bumble Bee Surveys, Palmdale Water District – Palmdale Ditch Conversion Project, Palmdale
Ms. Shoemaker conducted Crotch's Bumble bee photo surveys along 7 miles of the Palmdale ditch. These surveys consisted of walking transects throughout the project area, recording floral resources, and bumble bee identification. She surveyed for and identified both Crotch's Bumble bee (*Bombus crotchii)* and Yellow-faced Bumble bees (*Bombus vosnenskii*). She observed 2 male and 6 worker *B. Crotchii.*

Crotch's Bumble Bee Surveys, Renewable Properties – RPCA 230th Street Solar Project, Lancaster
Ms. Shoemaker conducted Crotch's Bumble bee capture surveys across the approximately 33 acre project area. These surveys consisted of walking transects throughout the project area, recording floral resources, and bumble bee identification. She surveyed for Crotch's Bumble bee (*Bombus crotchii)* and captured/identified *B. Crotchii.* Three *B. Crotchii* workers were captured/observed within the project area.

Crotch's Bumble Bee Surveys, Tracy BESS LLC– Tracy Long Duration Energy Storage Project, San Joaquin County
Ms. Shoemaker conducted Crotch's Bumble bee capture surveys across the approximately 39.5 acre project area. These surveys consisted of walking transects throughout the project area, recording floral resources, and bumble bee identification. She captured and identified one male black-tailed bumble bee (*Bombus melanopygus*).

Crotch's Bumble Bee Surveys, City of San Luis Obispo – PCE Plume Characterization Project, San Luis Obispo
Ms. Shoemaker conducted Crotch's Bumble bee capture surveys across the approximately 15 acre project area. These surveys consisted of walking transects throughout the project area, recording floral resources, and bumble bee identification. She surveyed for Crotch's Bumble bee (*Bombus crotchii)* and captured/identified Yellow-faced Bumble bees (*Bombus vosnenskii*), California Bumble bee (*Bombus fervidus*), and Black-tailed Bumble bees (*Bombus melanopygus*). No *B. Crotchii* were captured or observed. Conducted both protocol surveys and a habitat assessment, and drafted both reports.

Crotch's Bumble Bee Surveys, Patch Services, LLC– Vaca Dixon Power Center 2025 Site B, Vacaville

Ms. Shoemaker conducted Crotch's Bumble bee capture surveys across the approximately 10 acre project area. These surveys consisted of walking transects throughout the project area, recording floral resources, and bumble bee identification. Additionally, Ms. Shoemaker drafted the survey report for these protocol surveys. No bumble bees were captured or observed.

Biologist, City of Santa Barbara– Defensible Space, Santa Barbara

Ms. Shoemaker surveyed for nesting birds and native plants before work activities in various open spaces and parks throughout Santa Barbara. These surveys consisted of flagging natural resources for avoidance, keeping a daily log and species list, and reporting. Active bird nests found include Anna's hummingbird (*Calypte anna*), red-shouldered hawk (*Buteo lineatus*), and cliff swallow (*Petrochenlidon pyrrhonota*).

Biologist, City of Santa Barbara– On-call nesting bird surveys, Santa Barbara

Ms. Shoemaker surveyed for nesting birds before various work activities throughout open spaces and parks in Santa Barbara. Active bird nests found include acorn woodpecker (*Melanerpes formicivorus*), American crow (*Corvus brachyrhychos*), band-tailed pigeon (*Patagioenas fasciata*), great blue heron (*Ardea herdias*), and Anna's hummingbird (*Calypte anna*).

Biologist, Southern California Gas Company -- PSEP L1005 Hydrotest P2, Ventura County
Biologist for project construction monitoring for nesting birds the project site. Conducted nesting bird surveys for potential nesting migratory birds and preconstruction site walks for potential special status species prior to daily construction activities. Oversaw the implementation of avoidance and minimization measures at each project site. Recommended and oversaw implementation of avoidance and minimization measures for nesting birds/raptors. Monitored and found active DEJU and RTHA nest.

Melissa Pechter

Senior Biologist, Project Manager

Melissa has a well-rounded background and experience as a project manager and biologist supporting a variety of projects in urban to rural landscapes. Her work typically involves biological surveys, monitoring, agency permitting, and management of special-status species and jurisdictional waters in support of state and federal environmental regulations administered by various government agencies including the US Army Corps of Engineers, US Fish and Wildlife Service, California Department of Fish and Wildlife, Regional Water Quality Control Board, and local municipalities. Her experience managing biological, vegetation, and water resources has contributed to her ability to evaluate, minimize, and mitigate potential impacts to resources, making her a useful and effective team member and leader.

SELECT PROJECT EXPERIENCE

Senior Biologist, Montecito Sanitary District – Protective Measures of District Facilities Projects, Santa Barbara County
Melissa has supported Montecito Sanitary District with a number of creek bank repair projects needed to protect exposed infrastructure within the District's service area. Her work has included jurisdictional delineations and biological assessments of the project areas, drafting reports and permit applications in support of the projects, conducting agency coordination, providing biological support during construction, and implementing restoration following project construction.

Restoration Biologist, City of Santa Barbara – Punta Gorda Street, Cabrillo Boulevard, Mason Street, Montecito Street, Gutierrez Street, De La Guerra Street, and Cota Street Bridge Replacements, Santa Barbara
Melissa assisted in restoring native riparian vegetative communities following removal and replacement of seven bridges in Santa Barbara. Gutierrez, Mason, Cabrillo, De La Guerra, and Cota Bridges span Mission Creek while Punta Gorda and Montecito Bridges span Sycamore Creek. Her work on these bridges involved construction monitoring, pin flagging species-specific planting locations in the project area to recreate a biodiverse natural landscape, monitoring restoration, and documenting survival of the restoration plants. She identified invasive exotic weed species for removal, marked them, and communicated directly with the landscape contractor to ensure they were removed. Melissa performed follow-up surveys to ensure the work was completed and conducted data collection for annual restoration monitoring reports.

Biologist, City of Santa Barbara – East Beach Restoration Project, Santa Barbara
Melissa provided biological support for restoration being conducted along Cabrillo Boulevard at the Santa Barbara waterfront. In coordination with the City, she has supervised seed collection from native dune species and facilitated propagation of the seeds prior to planting in the restoration area. She worked with contractors to conduct iceplant solarization of the restoration area prior to planting, providing construction support to avoid native plants, avoid protected birds, and ensure that overall project activities are in compliance with project conditions. Melissa also provides restoration maintenance oversight, monitoring, and reporting to regulatory agencies in accordance with the Restoration Plan developed for this project and approved by regulatory agencies.

YEARS OF EXPERIENCE

12

EXPERIENCE

Rincon Consultants, Inc. (2022 to present)

Cardno
(2014 to 2022)

Senior Biologist, City of Goleta – Ellwood Mesa Monarch Butterfly Habitat Management Plan and Community Wildfire Protection Plan Implementation, Goleta
Melissa supports biological support for implementation of the Monarch Butterfly Habitat Management Plan and Community Wildfire Protection Plan at Ellwood Mesa. She conducts monarch butterfly overwintering surveys, jurisdictional water resource delineations, and native vegetation mapping within the study area. In coordination with City of Goleta staff and other consultants, Melissa assists in authoring biological resource reports, fuels management planning, and California Coastal Commission waivers support of the proposed fuels management, access improvements, and habitat enhancement activities.

Biologist and Certified Arborist, City of Goleta - Environmental Services for Storm Damage Permitting Support, Goleta
Melissa has conducted biological resource assessments, jurisdictional delineations, and provided arborist monitoring in support of emergency repairs and tree removals following storm damage that occurred in early 2023. Melissa's work provides natural resource oversight and supports agency permitting of the emergency repairs and tree removals needed to protect infrastructure and public safety in the City of Goleta.

Project Scientist, DMF Fund, LLC – Santa Barbara Ranch Restoration Project – Santa Barbara County
Melissa provides restoration support for a residential development project on the Naples Coast. Her work includes mapping native grasslands, delineating coastal wetlands, quantifying potential impacts, and drafting plans to offset those impacts to native grasslands and coastal wetlands through restoration activities.

Certified Arborist, Mark Thomas – Highway 101 HOV Tree Survey, Santa Barbara
Melissa conducted tree surveys, health assessments, and mapping in support of the Highway 101 widening project as well as replacement/removal of existing Union Pacific Railroad Bridges in Santa Barabara. A tree inventory was developed to provide GPS locations and details for all trees within the project footprints, which will help quantify potential impacts to sensitive natural resources including locally protected trees and other coastal environmentally sensitive habitat areas.

Environmental Compliance Monitor, Santa Barbara Botanic Garden – Pritzlaff Conservation Center, Santa Barbara
Melissa acted as an on-site environmental coordinator monitoring construction activities and submitting weekly reports to the Santa Barbara County Planning and Development Department regarding project compliance with conditions identified in the Environmental Quality Assurance Plan. Melissa regularly coordinated with the construction foreman and environmental compliance manager regarding project progress and adherence to county conditions. She also assisted in authoring the post-construction report documenting construction activities conducted throughout development of the Conservation Center, compliance with county conditions, and post-construction restoration plans.

Biologist, Confidential Client – Riparian and Wetland Vegetation Study, Santa Barbara County
Melissa is assisting in the design and execution of a vegetation study intended to (1) monitor the quantity and structure of riparian and wetland vegetation and (2) determine water stress to riparian trees both before and during proposed groundwater pumping activities on a private ranch in Santa Barbara County. Melissa also supports remote-sensing monitoring for this project, using ENVI+IDL software to provide a broad-scale comparison to the field data collection.

Field Team Member, The Lund Group – Lund Property, Goleta
Melissa assisted with southern California tarplant (*Centromadia parryi ssp. australis*) surveys and a wetland delineation prior to development of a 14-acre parcel located in Goleta. Southern California tarplant is an annual herb native to California that is listed as rare by the California Native Plant Society. Melissa conducted visual surveys for tarplant and a wetland delineation around the historical channel of San Pedro Creek. Work involved vegetation identification, soils classification, and assessment of hydrologic conditions on-site.

Certified Arborist, City of San Luis Obispo – Emergency Repairs, San Luis Obispo
Melissa conducted a tree inventory survey in the vicinity of emergency repairs needed at Nipomo Street Bridge over Stenner Creek and near the Madonna off-ramp downstream to the Elks Lane bridge along San Luis Obispo Creek. Trees in the work areas were identified by species, measured at breast height, tagged with identification numbers, and mapped to support permitting of emergency repairs.

CHRISTOPHER JULIAN

Principal-in-Charge and Regulatory Specialist

Christopher has over 22 years of experience as an environmental consultant and currently leads the Natural Resources team at Rincon's Santa Barbara office. His expertise includes environmental analyses under NEPA and CEQA, as well as comprehensive state and federal stream and wetlands permitting. This encompasses agency coordination and negotiations, jurisdictional determinations, wetlands functional assessments, and 404(b)(1) analyses. He has successfully guided clients in designing projects that comply with regulatory requirements and has managed the preparation of complex documents related to CEQA, NEPA, and the Endangered Species Act (ESA). His background also includes constraints-based environmental site selection, and he has prepared numerous siting and feasibility evaluations for renewable energy and other markets. Christopher has managed environmental projects for many public agencies in the Santa Barbara area, including the Santa Barbara Airport, the City of Goleta, the Santa Barbara County Flood Control District, and the U.S. Department of Defense. As Principal-in-Charge, his project responsibilities include contract administration, strategic guidance, and overall quality assurance for all project deliverables.

YEARS OF EXPERIENCE

22

PROJECT EXPERIENCE

Principal-in-Charge, City of Santa Barbara – Vic Trace Reservoir Replacement Project, Santa Barbara County
Christopher oversaw a team of environmental planners, archaeologists, biologists, and hazardous materials specialists supporting replacement of the Vic Trace reservoir, an aging underground water storage facility. Services included an initial constraints assessment followed by a suite of technical studies necessary to support evaluation of the project under CEQA. Studies prepared for the project include biology, cultural resources, paleontological resources, air quality, construction health risk, and traffic. Due to State Revolving Fund involvement, documents are being prepared to meet "CEQA-Plus" standards and consider relevant federal "cross-cutter" regulations.

Principal in Charge, City of Santa Barbara – Las Positas/Modoc Multi-Use Path, Santa Barbara, California. Christopher oversaw a team of environmental professionals ensuring compliance during the construction of a Class I bicycle path in Santa Barbara's coastal zone. Rincon negotiated final permits, including restoration and mitigation plans for protected trees and impacts to streams and sensitive habitats. Key concerns included nesting birds, sensitive vegetation, special-status reptiles, cultural resources, and protected trees. The team maintained the project schedule by completing pre-activity surveys promptly to support construction progress.

Principal in Charge, City of Santa Barbara – Quinientos Street Bridge Replacement, Santa Barbara, California. Christopher oversaw a team of environmental professionals during the Quinientos Street bridge replacement over Sycamore Canyon Creek in Santa Barbara. Key concerns included the threatened California red-legged frog, protected riparian trees, nesting birds, and water quality. The project achieved full compliance with environmental regulations, and Rincon's biologists successfully negotiated reduced monitoring costs as it neared completion. Ecological restoration continued for five years post-construction.

Principal-in-Charge, City of Goleta – Ellwood Mesa Habitat Management Plan, Santa Barbara County
Provided biological services in support of preparation and permitting of Monarch Butterfly Habitat Management Plan (MBHMP) for the Ellwood Mesa/Sperling Preserve Open Space. Chris assisted with updating the existing draft of the management plan with technical analysis and direction for the current conditions in the monarch butterfly habitat on Ellwood Mesa. He also attended and assisted with agency meetings, public workshops, and City Council meetings. Increasing drought-stressed and dying eucalyptus trees in the butterfly habitat prompted the completion of the MBHMP which was approved by the Goleta City Council in March 2019. The intent of the MBHMP is to maintain and improve the monarch butterfly seasonal aggregation habitat areas to ensure long-term viability of the monarch butterfly population and a variety of other native plant and animal species while allowing for coastal access, education and recreation. Chris' involvement also included permitting elements of the project through the resource agencies and Coastal Commission, as well as overseeing compliance during implementation.

Principal-in-Charge, City of Goleta – Stow Grove Park Master Plan, Goleta
Chris oversaw a team conducting biological resources evaluations for a large-scale overhaul of Stow Park, a large municipal park providing active and passive recreational opportunities for Goleta residents. The park includes a grove of mature redwood trees that are declining as a result of the 2010-2018 drought. Chris' team mapped vegetation and sensitive biological resource occurrences in the park, and worked with a design team to develop a Master Plan that accommodates necessary upgrades to the park while maintaining and enhancing the park's native biological resources. Key issues included oaks and other mature native trees, raptor nesting and roosting habitat, and monarch butterfly aggregation sites. Following development of the Master Plan, Chris' team prepared CEQA documentation and worked with City staff to secure City Council approval.

Permitting Lead, City of Goleta – Ekwill Street and Fowler Road Extensions Project EIR, Goleta, California. Reviewed and finalized an EIR Biological Resources section and biological technical studies for a capital improvement project involving the extension of two arterial roadways in the City of Goleta's Old Town. Deliverables included a City of Goleta EIR, a Caltrans Natural Environment Study, addenda to both addressing changed project details, permit applications to the U.S. Army Corps of Engineers, the Central Coast Regional Water Quality Control Board, California Department of Fish and Wildlife, and the California Coastal Commission, a biological study, and a Biological Assessment evaluating effects on the least Bell's vireo as required by Section 7 of the Endangered Species Act. The project has received all approvals and is scheduled for construction in 2022.

Permitting Lead, City of Goleta – Hollister Avenue Bridge Replacement Project, Goleta, California. Supervised preparation of all biological environmental documentation necessary to support replacement of an aging concrete roadway bridge across San Jose Creek in Old Town Goleta, California. Documents prepared included a Natural Environment Study to Caltrans' specifications, a biological impacts analysis to satisfy CEQA (MND), and permit applications to the U.S Army Corps of Engineers, California Department of Fish and Wildlife, and Central Coast Regional Water Quality Control Board

Permitting Lead, County of Santa Barbara – Santa Barbara Ranch Final EIR, Santa Barbara County, California. Oversaw biology-related elements of an EIR for a complex and highly controversial housing development near Goleta, California. Key biological issues of concern raised by the public included loss of native grasslands, loss of foraging habitat for the white-tailed kite, degradation of coastal streams and wetlands, and consistency with the policies of the California Coastal Act and Santa Barbara County Coastal Land Use Plan. Responding to comments required extensive analysis of applicable policies, including the General Plan, Coastal Land Use Plan, and Zoning Ordinance, as well as applicable regulations protecting biological resources. Worked with County staff and counsel to address policy overlap scenarios.

Project Manager, Newhall Land and Farming Company – Newhall Ranch Resource Management and Development Plan, Los Angeles County
Oversaw an interdisciplinary team of professionals preparing a joint EIS/EIR supporting federal and state authorizations related to jurisdictional waters, streambeds, and endangered species for a large, master-planned housing development in Los Angeles County, California. Habitat loss, modification of streambeds, greenhouse gas emissions, solid waste capacity, flood control, and long-term maintenance were key elements of the EIS/EIR. Stand-alone documents Chris' team prepared to support the EIS/EIR included a Biological Assessment, Wetlands Functional Assessment, Section 404(b)(1) Alternatives Analysis, and Historic Properties Treatment Plan, among others. The project received state approval in 2010, and federal approvals were granted in 2011.

RE: Assembly Bill 52 Consultation Notification for the Vic Trace Reservoir Replacement Project, City of Santa Barbara, Santa Barbara County, California

Dear Chairperson Fishburn:

The City of Santa Barbara (City) proposes the Vic Trace Reservoir Replacement Project (Project) located in the city of Santa Barbara, Santa Barbara County, California. The Project would replace and upgrade aging water infrastructure to ensure safe and reliable drinking water for the City by improving infrastructure on the Vic Trace Reservoir parcel and in the surrounding Alta Mesa neighborhood. The parcel currently contains existing water infrastructure facilities, City communication facilities, and La Coronilla Park. Underground water main pipeline (main) work is proposed within the public right-of-way (ROW) on paved roadways near the Vic Trace Reservoir parcel including La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road. A new Pressure Reducing Valve Station is proposed in the public ROW east of the intersection of Dolores Drive and Meigs Road on Dolores Drive between the curb and private property at 1740 Cliff Drive. The proposed project is subject to the California Environmental Quality Act (CEQA).

Vic Trace Reservoir parcel improvements would consist of replacing the existing 10 million-gallon (MG) Vic Trace Reservoir with two 5 MG reservoirs at the same site, re-abandonment of an existing oil well, building replacements, earthwork including grading and terracing, and site improvements on the parcel. Offsite improvements would consist of replacements, repairs, abandonments, and relocations of aging water infrastructure in the public ROW in the Alta Mesa neighborhood.

The Project must comply with California Public Resources Code Section 21080.3.1 (Assembly Bill [AB] 52 of 2014), which requires local governments to conduct meaningful consultation with California Native American tribes that have requested to be notified by lead agencies of proposed projects in the geographic area with which the tribe is traditionally and culturally affiliated.

Your tribe's input is important to the City's planning process. Under AB 52, you have 30 days from receipt of this notification to respond in writing if you wish to consult on the Project. If you require any additional information or have any questions, please contact me at (805) 564-5537 or via e-mail at BCornett@SantaBarbaraCA.gov. Thank you for your assistance.

Sincerely,

Beth Anna Cornett

RE: Assembly Bill 52 Consultation Notification for the Vic Trace Reservoir Replacement Project, City of Santa Barbara, Santa Barbara County, California

Dear Tribal Historic Preservation Officer Zavalla:

The City of Santa Barbara (City) proposes the Vic Trace Reservoir Replacement Project (Project) located in the city of Santa Barbara, Santa Barbara County, California. The Project would replace and upgrade aging water infrastructure to ensure safe and reliable drinking water for the City by improving infrastructure on the Vic Trace Reservoir parcel and in the surrounding Alta Mesa neighborhood. The parcel currently contains existing water infrastructure facilities, City communication facilities, and La Coronilla Park. Underground water main pipeline (main) work is proposed within the public right-of-way (ROW) on paved roadways near the Vic Trace Reservoir parcel including La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road. A new Pressure Reducing Valve Station is proposed in the public ROW east of the intersection of Dolores Drive and Meigs Road on Dolores Drive between the curb and private property at 1740 Cliff Drive. The proposed project is subject to the California Environmental Quality Act (CEQA).

Vic Trace Reservoir parcel improvements would consist of replacing the existing 10 million-gallon (MG) Vic Trace Reservoir with two 5 MG reservoirs at the same site, re-abandonment of an existing oil well, building replacements, earthwork including grading and terracing, and site improvements on the parcel. Offsite improvements would consist of replacements, repairs, abandonments, and relocations of aging water infrastructure in the public ROW in the Alta Mesa neighborhood.

The Project must comply with California Public Resources Code Section 21080.3.1 (Assembly Bill [AB] 52 of 2014), which requires local governments to conduct meaningful consultation with California Native American tribes that have requested to be notified by lead agencies of proposed projects in the geographic area with which the tribe is traditionally and culturally affiliated.

Your tribe's input is important to the City's planning process. Under AB 52, you have 30 days from receipt of this notification to respond in writing if you wish to consult on the Project. If you require any additional information or have any questions, please contact me at (805) 564-5537 or via e-mail at BCornett@SantaBarbaraCA.gov. Thank you for your assistance.

Sincerely,

Beth Anna Cornett

RE: Assembly Bill 52 Consultation Notification for the Vic Trace Reservoir Replacement Project, City of Santa Barbara, Santa Barbara County, California

Dear Ms. Teeter:

The City of Santa Barbara (City) proposes the Vic Trace Reservoir Replacement Project (Project) located in the city of Santa Barbara, Santa Barbara County, California. The project would replace and upgrade aging water infrastructure to ensure safe and reliable drinking water for the City by improving infrastructure on the Vic Trace Reservoir parcel and in the surrounding Alta Mesa neighborhood. The parcel currently contains existing water infrastructure facilities, City communication facilities, and La Coronilla Park. Underground water main pipeline (main) work is proposed within the public right-of-way (ROW) on paved roadways near the Vic Trace Reservoir parcel including La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road. A new Pressure Reducing Valve Station is proposed in the public ROW east of the intersection of Dolores Drive and Meigs Road on Dolores Drive between the curb and private property at 1740 Cliff Drive. The proposed project is subject to the California Environmental Quality Act (CEQA).

Vic Trace Reservoir parcel improvements would consist of replacing the existing 10 million-gallon (MG) Vic Trace Reservoir with two 5 MG reservoirs at the same site, re-abandonment of an existing oil well, building replacements, earthwork including grading and terracing, and site improvements on the parcel. Offsite improvements would consist of replacements, repairs, abandonments, and relocations of aging water infrastructure in the public ROW in the Alta Mesa neighborhood.

The Project must comply with California Public Resources Code Section 21080.3.1 (Assembly Bill [AB] 52 of 2014), which requires local governments to conduct meaningful consultation with California Native American tribes that have requested to be notified by lead agencies of proposed projects in the geographic area with which the tribe is traditionally and culturally affiliated.

Your tribe's input is important to the City's planning process. Under AB 52, you have 30 days from receipt of this notification to respond in writing if you wish to consult on the Project. If you require any additional information or have any questions, please contact me at (805) 564-5537 or via e-mail at BCornett@SantaBarbaraCA.gov. Thank you for your assistance.

Executive Summary

Purpose and Scope

Rincon Consultants, Inc. (Rincon) conducted a desktop Paleontological Resources Assessment (PRA) on behalf of the City of Santa Barbara (City) for the Vic Trace Reservoir Replacement Project (Project) in Santa Barbara County, California. This assessment includes a literature review, paleontological records search, paleontological sensitivity assessment, and reporting consistent with the professional standards of the Society of Vertebrate Paleontology (SVP; 2025). The project is subject to the California Environmental Quality Act (CEQA), and the City is the lead agency for CEQA.

Rincon reviewed geologic maps (Minor et al. 2009), the Project's geotechnical report (Earth Systems Southern California 2013), online paleontological databases (Paleobiology Database 2025; University of California Museum of Paleontology 2025), and primary literature (Wright 1972), and requested a records search of the Santa Barbara Museum of Natural History (SBMNH) to assess the potential for Project-related construction activities to significantly impact paleontological resources.

Results of Investigation

The Project is underlain by three geologic units per the map of Minor et al. (2009), all of which have Fossil Map Prediction System (FPMS) 4 (High) paleontological sensitivity based on their history of producing significant fossils in the region: Quaternary marine terrace deposits, Santa Barbara Formation, and Monterey Formation. The Project's geotechnical report (Earth Systems Southern California 2013) reported up to 14.5 feet of artificial fill, which has FPMS 1 (Very Low) paleontological sensitivity, within parts of the Vic Trace Reservoir parcel, but the distribution of this artificial fill appears non-continuous and difficult to predict. A records search of the SBMNH determined there are no known fossil localities within the Project site (SBMNH 2025).

Impacts and Recommendations

The Project is underlain by three geologic units (Quaternary marine terrace deposits, Santa Barbara Formation, and Monterey Formation) with FPMS 4 (High) paleontological sensitivity. Ground-disturbing construction activities that affect previously undisturbed portions of these geologic units could result in significant impacts to paleontological resources under CEQA.

Ground-disturbing activities for the Project are anticipated to include excavations for the two new reservoirs, valve vaults, entry/exit pits for pipeline lining, and PRV station; terracing of sloped portions of the reservoir parcel; and open-trenching for new main alignments and storm drains. These activities will affect previously undisturbed, high-sensitivity sediments, and therefore, have the potential to significantly impact paleontological resources.

Mitigation is recommended to reduce potential impacts to paleontological resources to a level of less-than-significant under CEQA and maintain compliance with City regulations. These mitigation recommendations include a Worker Environmental Awareness Program training and drafting a Paleontological Resources Mitigation Plan; paleontological monitoring for ground-disturbing activities within previously undisturbed sediments with FPMS 4 (High) paleontological sensitivity; and (if necessary) salvage, preparation and curation of discovered paleontological resources.

1 Introduction

Rincon Consultants, Inc. (Rincon) conducted a desktop Paleontological Resources Assessment (PRA) on behalf of the City of Santa Barbara (City) for the Vic Trace Reservoir Replacement Project (Project) in Santa Barbara County, California. This assessment includes a literature review, paleontological records search, paleontological sensitivity assessment, and reporting consistent with the professional standards of the Society of Vertebrate Paleontology (SVP; 2025). The project is subject to the California Environmental Quality Act (CEQA), and the City is the lead agency for CEQA.

Paleontological resources (i.e., fossils) are the remains or traces of prehistoric life. Fossils are typically preserved in layered sedimentary rocks, and the distribution of fossils across the landscape is controlled by the distribution and exposure of the fossiliferous sedimentary rock units at and near the surface. Construction-related impacts that typically affect or have the potential to affect paleontological resources include mass excavation operations, drilling/borehole excavations, trenching/tunneling, and grading. Ground-disturbing construction activities associated with the proposed project would mainly consist of grading, trenching, and excavation. This PRA provides a list of the formations mapped at the surface within the project site and formations that underlie those mapped at the surface that may be impacted by project construction activities.

1.1 Project Location

The Project site encompasses the Vic Trace Reservoir parcel, 1633 La Coronilla Drive, and various water infrastructure improvements in the Alta Mesa neighborhood in the City of Santa Barbara, California.

The Vic Trace Reservoir parcel covers approximately 15 acres (14.726 acres) and is located on City-owned property at 740 Dolores Drive, Santa Barbara (Assessor's Parcel Number [APN] 035-033-031). The parcel contains existing water infrastructure facilities, existing City communication facilities, and La Coronilla Park. Access to the Vic Trace Reservoir parcel is from La Coronilla Drive between residences at 1617 and 1633 La Coronilla Drive via an existing 20-foot-wide easement through the 1617 La Coronilla Drive property.

A single-family residence located at 1633 La Coronilla Drive is owned by the City of Santa Barbara and is proposed to be used for temporary construction offices during the Project.

Underground water main pipeline (main) work is proposed within the public right-of-way (ROW) paved roadways near the Vic Trace Reservoir Parcel, including La Coronilla Drive, Dolores Drive, Ricardo Avenue, La Vista Del Oceano, and Meigs Road. Figure 1 displays the regional location of the Project site, and Figure 2 displays the location within a neighborhood context.

Figure 1 Regional Location

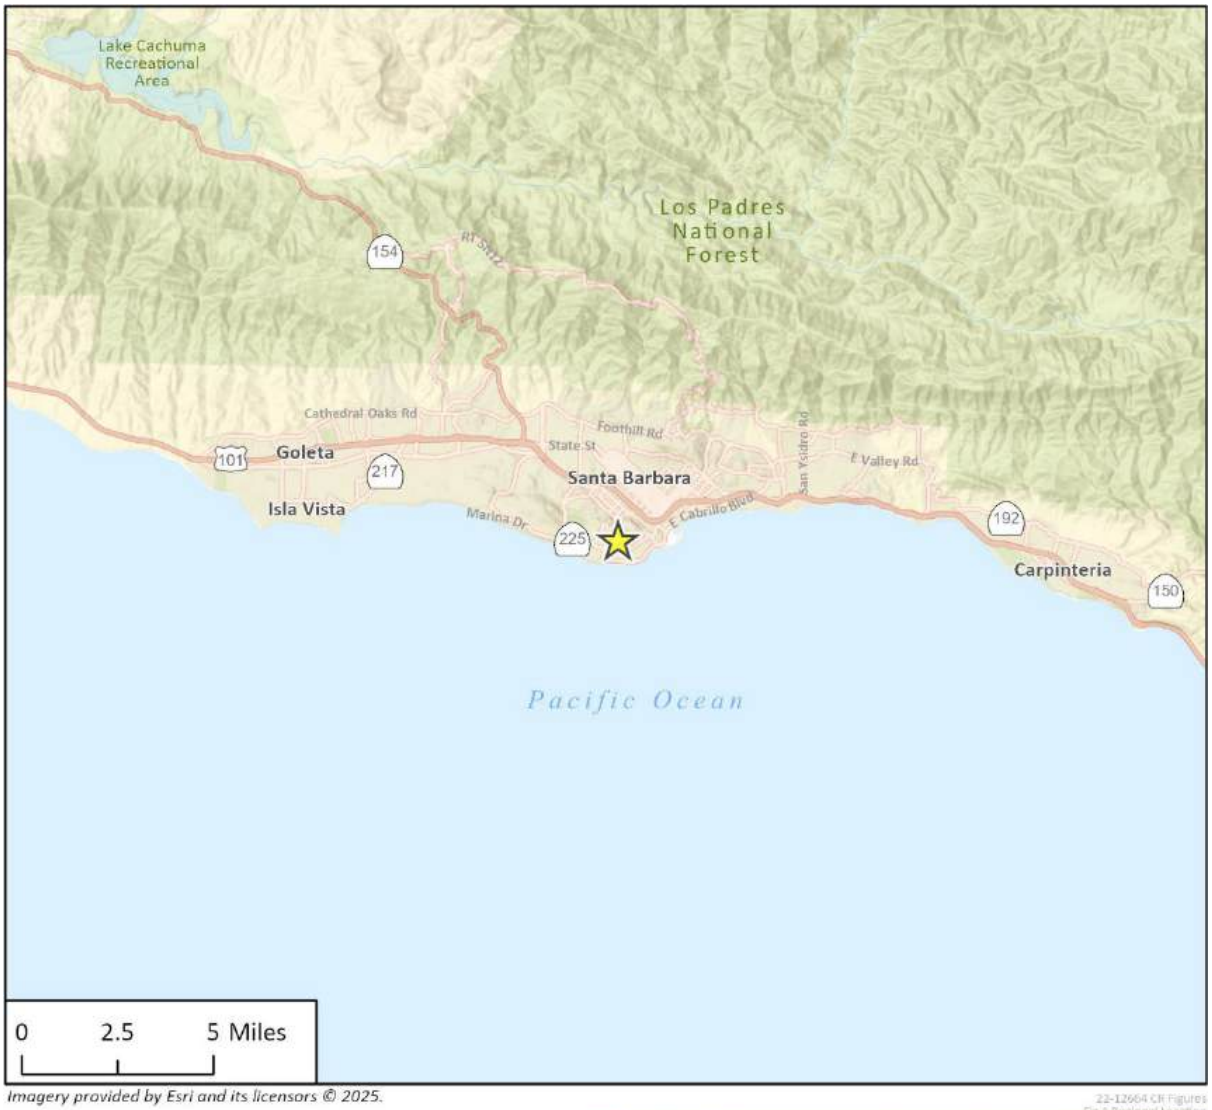

Figure 2 Project Site Location

Imagery provided by Esri and its licensors © 2026.

1.2 Project Description

Project Characteristics

The Project includes the following main elements:

- **Vic Trace Reservoir Parcel Improvements.** Replacement of the existing 10 million-gallon (MG) Vic Trace Reservoir with two 5 MG reservoirs at the same site, re-abandonment of the abandoned oil well, building replacements, earthwork, and site improvements on the parcel, including possible renewable energy generation and storage.
- **Offsite Improvements**
  - **Underground Water Mains:** Replacements, repairs, abandonments, and relocations of aging water mains in neighborhood areas near the Vic Trace Reservoir parcel.
  - **Underground PRV Station Relocation**: Relocation of the reservoir's downstream PRV station to an improved location with safer entry.
  - **Construction Offices**: Use of a City-owned single-family residential property for temporary construction offices for safer and more accessible neighbor engagement with Project personnel.

Vic Trace Reservoir Parcel Construction Activities

The Project would shut down, drain, and demolish the existing Vic Trace Reservoir. Project demolition would include the entire existing Vic Trace Reservoir, appurtenant piping, pavement, and reservoir fencing; the existing Valve Building, IT/Communications Building, hydro-pneumatic tank, disinfection facilities, generator, and aboveground fuel tank; asphalt pavement and curb and gutter along La Coronilla Drive at the site entrance; the existing entrance access road from the Valve Building to the reservoir pad; all existing on-site utilities; and most existing on-site vegetation.

Project construction activities would include grading the site, re-abandoning the oil well, constructing two 5 MG reservoirs, constructing retaining walls to create terraced areas, and constructing the Valve and IT/Communications Buildings. The terraced areas would be used for staging and laydown during construction, and for other water operations and maintenance uses during the reservoir's ongoing operation. Approximately 13,840 cubic yards of concrete would be required for the retaining walls.

The major elements of construction for prestressed concrete reservoir tanks include the tank floor, footings and columns, wall sections, and the roof. Approximately 6,450 cubic yards of concrete would be required for reservoir construction.

Pipeline Abandonment, Rehabilitation, and Construction

La Coronilla Transmission Main Abandonment

The existing La Coronilla Transmission Main to be abandoned would be cut and capped with a welded on blind flange or plate. No ground disturbing activities would be required for the abandonment. Minor aboveground appurtenances (e.g., valve cans) would remain in place.

Existing Vic Trace Outlet Main Abandonment and Rehabilitation

The existing Vic Trace Outlet Main would be partially abandoned and partially rehabilitated as part of the La Vista Del Oceano Pipeline Lining portion of the Project. The following sections outline the abandonment and rehabilitation activities:

- **Northern Segment Abandonment (Existing Vic Trace Outlet Main).** The northern segment would be abandoned in place. No ground disturbance would be required for this portion, and the pipeline would be cut and capped at its terminus near Ricardo Avenue.
- **Southern Section Rehabilitation (La Vista Del Oceano Pipeline Lining – Entry and Exit Pits).** The southern segment would be rehabilitated using trenchless relining methods. Construction would begin with the excavation of an approximately 6-foot by 10-foot by 6-foot-deep entry pit within the Ricardo Avenue ROW to expose the existing pipeline. A corresponding exit pit, approximately 6 feet by 10 feet by 8 feet deep, would be excavated near 1532 La Vista Del Oceano on the western side of the roadway, either within the ROW or an existing utility easement. From the entry pit, a liner would be installed heading south through the existing pipeline alignment towards the exit pit. Upon completion of the relining process, custom fittings would be installed within the trench, followed by backfilling and repaving of the disturbed roadway surface. Final restoration would include installation of fittings, backfilling, repaving, and/or replanting, as appropriate.

New, Replaced, and Relocated Pipelines

The Relocated La Coronilla Transmission Main, New Vic Trace Outlet Main, Replaced Dolores Drive Main, and New Ricardo Avenue Main would be constructed using open-cut trench methods. Open-cut trench pipeline installation typically consists of trench excavation (including saw cutting of pavement where applicable), removal of pipeline, pipe bedding stabilization, pipe installation, and backfill. The construction crew would typically operate a backhoe and/or excavator, compaction equipment (attachment on an excavator and hand-operated equipment), dump trucks for stockpiling of soils and delivery of backfill material, utility trucks (with truck-mounted or towed generator and hand tools), and water trucks/water buffalos.

Pipeline construction would progress in a linear manner along each alignment, with an estimated average installation rate of approximately 75 feet per day. Generally, trench spoils would be temporarily stockpiled within the working area adjacent to the pipeline trench or on the Vic Trace Reservoir parcel.

PRV Station Abandonment and Construction

PRV station abandonment activities would be limited to valve replacement within the existing PRV; no excavation would be required, as the valve can be replaced using existing manhole entrances and mechanical tools.

Construction of the new, relocated PRV station at Dolores Drive and Meigs Road would involve excavation, installation of the vault and equipment, and backfilling. First, a hole would be excavated (18 feet long by 10 feet wide by 8 feet deep) to accommodate the new vault (16 feet by 8 feet) with the top of the vault and hatches at grade. The utility vault would either be cast in place or pre-cast. If pre-cast, the vault would be installed with a small crane. The vault would contain water appurtenances such as pipelines, valves, a sump pump, and remote water monitoring equipment, and would be connected to electrical power.

Aboveground features at the new PRV station are expected to include a programmable logic controller (PLC) panel, a separate Southern California Edison (SCE) electrical service enclosure, and a low-profile antenna for Supervisory Control and Data Acquisition (SCADA) communications. These components would be installed adjacent to the underground vault, with all electrical connections routed underground to a nearby overhead power pole at the intersection of Dolores Drive and Meigs Road. Additional visible elements may include at-grade access hatches and small vent pipes, consistent with other PRV installations throughout the City. Additional underground pipelines would be constructed to connect the PRV station to existing pipelines within the ROW.

1.3 Personnel

Rincon paleontologist Andrew McGrath was the primary author of this report and was assisted by Zachary Lerma. Christopher Duran provided principal-level review. Resumes for these individuals are provided in Appendix A.

2 Regulations

2.1 State Regulations

California Environmental Quality Act

Paleontological resources are protected under CEQA, which states a project would "normally" have a significant effect on the environment if project effects exceed an identified threshold of significance (CEQA Guidelines Section 15064.7[a]). Appendix G of the CEQA Guidelines (the Environmental Checklist Form) provides suggested thresholds of significance for evaluating a project's environmental impacts, including impacts to paleontological resources. In Section VII(f), the question is posed thus: "Will the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?" To determine the uniqueness of a given paleontological resource, it must first be identified or recovered (i.e., salvaged). Therefore, CEQA mandates mitigation of adverse impacts, to the extent practicable, to paleontological resources.

CEQA does not define "a unique paleontological resource or site." However, Scott and Springer (2003) stated, and SVP (2025) concurred, that fossils should be considered significant if they meet one or more of these criteria:

- The fossils provide data on the evolutionary relationships and developmental trends among organisms, both living and extinct.
- The fossils provide data useful in determining the age(s) of the rock unit or sedimentary stratum, including data important in determining the depositional history of the region and the timing of geologic events therein.
- The fossils provide data regarding the development of biological communities or interaction between paleobotanical and paleozoological biotas.
- The fossils demonstrate unusual or spectacular circumstances in the history of life.
- The fossils are in short supply and/or in danger of being depleted or destroyed by the elements, vandalism, or commercial exploitation, and are not found in other geographic locations.

California Public Resources Code

California Public Resources Code Section 5097.5 states:

> No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over such lands. Violation of this section is a misdemeanor.

Here "public lands" means those owned by, or under the jurisdiction of, the State or any city, county, district, authority, or public corporation, or any agency thereof. Consequently, public agencies are required to comply with Public Resources Code Section 5097.5 for their own activities, including construction and maintenance, and for permit actions (e.g., encroachment permits) undertaken by others.

2.2 Regional and Local Regulations

City of Santa Barbara Municipal Code

Chapter 22.12 of the City of Santa Barbara Municipal Code addresses the preservation and protection of paleontological resources in the City of Santa Barbara.

Section 22.12.020A states that grading permits granted for areas of known or probable paleontological (or archaeological) significance shall ensure that the grading activities are designed so as to:

- Ensure the preservation or avoidance of the site, if feasible; or
- Minimize adverse impacts on the site; or
- Allow reasonable time for qualified professionals to perform archaeological or paleontological investigations at the site; or
- Preserve for posterity, in such other manner as may be necessary or appropriate in the public interest, the positive aspects of the archaeological or paleontological site involved.

3 Paleontological Resources Assessment Guidelines

Paleontological resources are limited, nonrenewable resources of scientific, cultural, and educational value and are afforded protection under state and local laws and regulations. This PRA satisfies Public Resources Code Section 5097.5 requirements, addresses requirements under CEQA guidelines and City of Santa Barbara laws for identifying impacts to paleontological resources, and follows guidelines and significance criteria specified by the SVP (2010).

3.1 Paleontological Sensitivity

Paleontological sensitivity refers to the potential for a geologic unit to produce scientifically significant fossils. Direct impacts to paleontological resources occur when earthwork activities, such as grading or trenching, cut into the geologic deposits within which fossils are buried and physically destroy the fossils. Because fossils are the remains of prehistoric animal and plant life, they are considered to be nonrenewable. These activities may constitute significant impacts under CEQA or adverse effects under federal environmental protection laws and may require mitigation. Sensitivity is determined by rock type, history of the geologic unit in producing significant fossils, and fossil localities recorded from that unit. Paleontological sensitivity is derived from the known fossil data collected from the entire geologic unit, not just from a specific survey.

In general, vertebrate fossil localities are considered more scientifically significant than those containing exclusively invertebrate fossils, because vertebrate fossils are rarer than invertebrate or plant fossils. The recognition of new vertebrate fossil localities can offer new information on prehistoric species' geographic range, geologic age, morphology, evolutionary relationships, depositional environment, and other important scientific questions. Thus, geologic units having the potential to contain vertebrate fossils are considered the most sensitive. However, invertebrate and plant fossil localities may be considered scientifically significant depending on the quality of preservation, geologic context, geographic location, depositional environment, number of individuals or fossil taxa preserved, or the ability of the locality to inform other scientific questions. Furthermore, if a geologic unit is known to contain non-significant paleontological resources, then it is also likely capable of preserving significant paleontological resources. Thus, geologic units heretofore only known to produce invertebrate or plant fossils may still be considered paleontologically sensitive.

3.2 Resource Assessment Criteria

The SVP *Best Practice Guidelines for Mitigation of Adverse Impacts to Paleontological Resources* describes the Fossil Prediction Map System (FPMS), which provides criteria and a scale for determining the paleontological sensitivity of difference rock units (SVP 2025). FPMS assignments are based on rock units within which vertebrate or significant invertebrate fossils have been determined by previous studies to be present or likely to be present. Fossil occurrences are correlated with the geologic units that contain them, so the history of a geologic unit in producing fossils can be used to predict its potential for producing fossils in the future. The FPMS is a 5-level scale ranging from FPMS 1 (Very Low Potential) to FPMS 5 (Very High Potential) geologic units along

with levels for geologic units with unknown potential or areas covered by water or ice. The following table is excerpted from the SVP (2025) guidelines and outlines the assignment criteria and management concerns for each FPMS level.

FPMS Designation	Assignment Criteria Guidelines and Management Summary
5 = Very high Potential	Highly fossiliferous geologic units that consistently and predictably preserve scientifically significant fossils.
	Management concern is very high. Paleontological resource impact evaluations and field surveys by a professional mitigation paleontologist are typically recommended prior to the proposed activity and full-time monitoring may be recommended during ground-disturbing activities in previously undisturbed geologic units, depending on the type and amount of disturbance. Scientifically significant fossils should be collected or avoided by the proposed project.
4 = High Potential	Highly fossiliferous geologic units that preserve scientifically significant fossils, but their concentrations vary and are less predictable than 5.
	Management concern is high. Paleontological resource impact evaluations and field surveys by a professional mitigation paleontologist are typically recommended prior to the proposed activity and full-time or part-time monitoring may be recommended during ground-disturbing activities in previously undisturbed geologic units, depending on the type and amount of disturbance. Scientifically significant fossils should be collected or avoided by the proposed project
3 = Moderate Potential	Fossiliferous geologic units that are often marine in origin and in which fossils may be common, but scientifically significant fossils are isolated or sparse.
	Management concern is moderate. Paleontological resource impact evaluations are recommended. Based on the results, field surveys by a professional mitigation paleontologist may be recommended prior to the proposed activity and full- or parttime monitoring may be recommended during ground-disturbing activities in previously undisturbed geologic units, depending on the type and amount of disturbance. Scientifically significant fossils should be collected or avoided by the proposed project
2 = Low Potential	Geologic units that are not likely to preserve fossils, including sedimentary deposits that are generally younger than 11,700 years before present, older sedimentary units that only rarely preserve fossils, or units that exhibit physical and chemical alteration (diagenetic changes) that make fossil preservation unlikely.
	Management concern is generally low. Paleontological resource impact evaluations, surveys, and monitoring are not typically recommended except in rare situations in which isolated scientifically significant fossils are known to be present in the study area.

FPMS Designation	Assignment Criteria Guidelines and Management Summary
1 = Very Low Potential	Geologic units that are not likely to contain recognizable fossils including Precambrian units and units that are igneous or metamorphic, excluding air-fall and reworked volcanic ash.
	Management concerns are very low. Impact mitigation is unlikely to be recommended except in rare circumstances.
U = Unknown Potential	Geologic units that cannot be assigned an informed FPMS designation. This includes units that have not been subject to prior field surveys but that contain lithologies or preserve depositional settings that are known to be conducive to fossil preservation, units that have not been published in the scientific literature, and units in which reports of fossils have not been verified.
	Management concern is medium to high until a provisional designation is made. Lacking other information, field surveys (entire study area or portion thereof for testing) are normally recommended, especially prior to authorizing a ground-disturbing activity. Based on the survey results, monitoring may be recommended during ground-disturbing activities in previously undisturbed geologic units. Any scientifically significant fossils that are discovered should be collected or avoided by the project.
I = Ice or Snow	Mapped geographic areas where underlying geology is obscured by ice or snow. Predictive potential for fossils is low, but when these areas appear on geologic maps or in GIS data, they may be useful for developing mitigation strategies or management recommendations for a larger analysis area that extends beyond the ice or snow.
	Although fossils may be preserved in glacial ice, management concerns are generally low, and impact mitigation is only recommended where fossils are known or may be present such as at the foot of a melting glacier.
W = Water	Mapped geographic area where underlying geology is obscured by water. No predictive potential for fossils, but when these areas appear on geologic maps or in GIS data, they may be useful for developing mitigation strategies or management recommendations for a larger analysis area that extends beyond the water or in projects in which the water is being drained. May need to consider the FPMS designation of the underlying geologic units.
	Management concerns are usually negligible or not applicable. Impact mitigation is unlikely to be necessary except in rare circumstances such as along the waterline (or shore).

4 Methods

Rincon reviewed the geologic map of Minor et al. (2009) and the Project's geotechnical report (Earth Systems Southern California [Earth Systems] 2013) to identify the geologic units present at and below the surface within the Project site. Rincon reviewed the online paleontological collections database of the University of California Museum of Paleontology (UCMP; 2025) and Paleobiology Database (2025) and consulted primary literature to identify known fossil localities in Santa Barbara County and surrounding regions from similar geologic units to those identified within the Project site. Rincon requested a records search of the Santa Barbara Museum of Natural History (SBMNH) on July 28, 2025, to identify any fossil localities known within the Project site or nearby fossil localities known from the same geologic units as those underlying the Project site. The Project site contains no bedrock exposures; therefore, a field survey was not warranted.

Paleontological sensitivity ratings of the geological formations were assigned based on the findings of the records search and literature review and based on the potential effects to nonrenewable paleontological resources from Project construction following SVP (2025) guidelines.

5 Description of Resources

5.1 Geologic Setting

The Project site is situated in the Transverse Ranges geomorphic province, one of the eleven geomorphic provinces in California (California Geological Survey 2002). The Transverse Ranges extend approximately 275 miles west-east from Point Arguello in Santa Barbara County, east to the San Bernardino Mountains, and south to the Anacapa-Santa Monica-Hollywood-Raymond-Cucamonga fault zone (Yerkes and Campbell 2005). The Transverse Ranges are composed of Proterozoic to Mesozoic intrusive crystalline igneous and metamorphic rocks overlain by Cenozoic marine and terrestrial sedimentary deposits and volcanic rock (Norris and Webb 1976).

Locally, the Project site is within the *Santa Barbara, California* United States Geological Survey 7.5-minute quadrangle.

5.2 Geology of the Project Site

The geology of the region around the Project site was mapped by Minor et al. (2009) who identified three geologic units underlying the site: Quaternary marine terrace deposits, Santa Barbara Formation, and Monterey Formation (Figure 3). The geotechnical investigation also reported up to 14.5 feet of artificial fill in the Vic Trace Reservoir parcel (Earth Systems 2013).

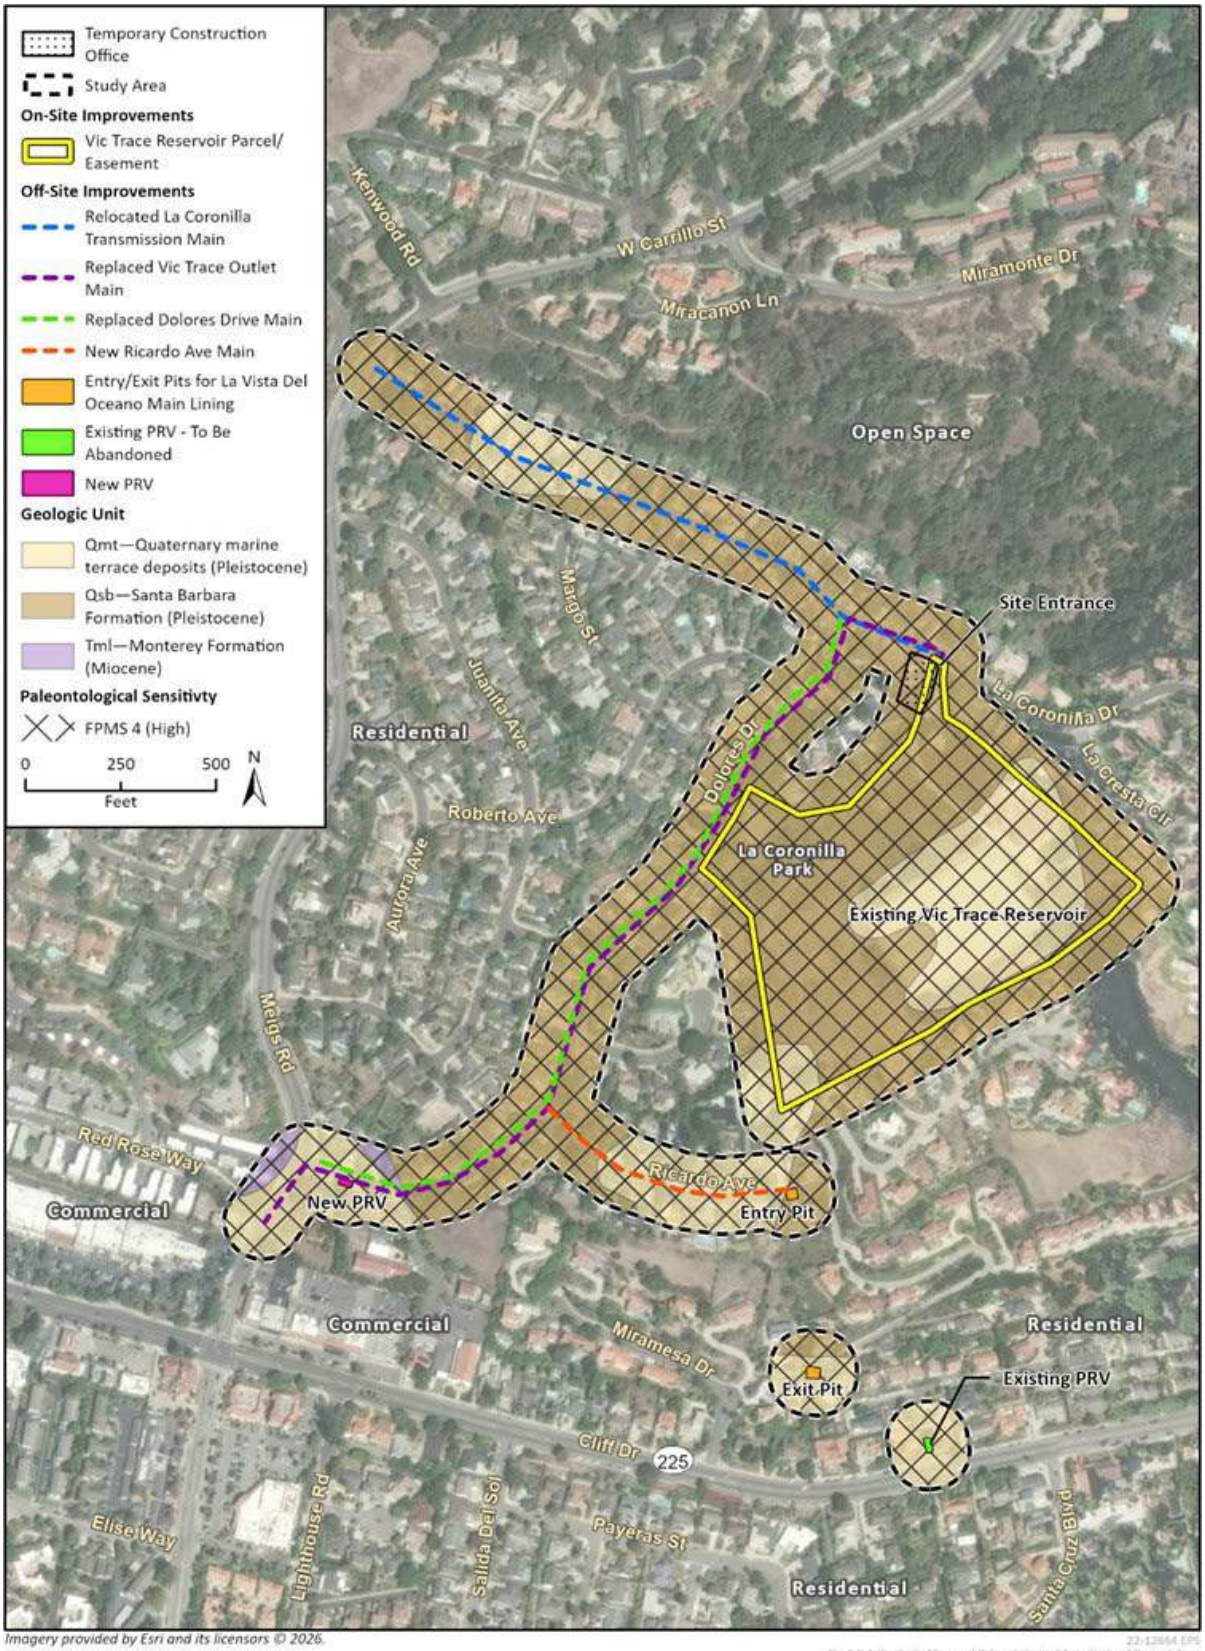
Artificial Fill

Artificial fill is not mapped in the Project site by Minor et al. (2009), but it was noted during the geotechnical investigation (Earth Systems 2013). Earth Systems (2013) stated that this artificial fill was likely placed during original reservoir construction with the greatest thickness, up to 14.5 feet, under the southwestern side of the existing reservoir. This artificial fill consists of silty sand. The distribution of artificial fill throughout this parcel is likely non-continuous and, therefore, difficult to predict. Artificial fill represents sediment removed from its original stratigraphic context; therefore, it has FPMS 1 (Very Low) paleontological sensitivity.

Quaternary Marine Terrace Deposits

Quaternary marine terrace deposits are mapped in several places within the Project site (Figure 3). Quaternary marine terrace deposits consist of tan, brown, or gray; weakly to moderately consolidated; weakly to moderately bedded; gravel, sandstone, or siltstone (Minor et al. 2009). This geologic unit is late Pleistocene in age and represents sediments deposited in near-shore marine environments. Quaternary marine terrace deposits are known to preserve paleontological resources, including in southern Santa Barbara County (Wright 1972; Minor et al. 2009; Paleobiology Database 2025; SBMNH 2025; UCMP 2025), producing eared seal (*Arctocephalus*), sea otter (*Enhydra*), mastodon (*Mammut*), mammoth (*Mammuthus*), cormorant (*Phalacocorax*), and invertebrate fossils. Given this fossil-producing history, Quaternary marine terrace deposits have FPMS 4 (High) paleontological sensitivity.

Figure 3 Geologic Map and Paleontological Sensitivity of Project Site



Imagery provided by Esri and its licensors © 2026.
Geologic data provided by Minor et al. 2009.

Santa Barbara Formation

The Santa Barbara Formation underlies the majority of the Project site (Figure 3). The Santa Barbara Formation is described by Minor et al. (2009) as consisting of pale-gray, buff, or pale yellow friable, massively bedded to laminated, sandstone and pebbly sandstone, and the strata of the Santa Barbara Formation encountered by Earth Systems (2013) consisted of massive or crudely bedded silt and sand. The Santa Barbara Formation is Pleistocene in age, and has produced numerous paleontological resources, including cormorant (*Phalacocorax*) and invertebrates (Minor et al. 2009; Paleobiology Database 2025; SBMNH 2025; UCMP 2025). Given this fossil-producing history, Santa Barbara Formation has FPMS 4 (High) paleontological sensitivity.

Monterey Formation

Small portions of the Project site are mapped as Monterey Formation (Figure 3). Specifically, Minor et al. (2009) identified these strata as the 'lower calcareous unit', which consists of brown weathering to white or tan, well-bedded, siliceous mudstone or shale with minor amounts of dolomite, breccia, and sandstone. The Monterey Formation has produced numerous paleontological resources in Santa Barbara County including marine mammal (*Paleoparadoxia*), sea bird (*Osteodontornis*, *Phalacocorax*), shark (Elasmobranchii), ray-finned fish (Actinopterygii), and invertebrate fossils (Paleobiology Database 2025; SBMNH 2025; UCMP 2025). Given this fossil-producing history, the Monterey Formation has high paleontological sensitivity.

5.3 Paleontology of the Project Site

A paleontological records search of the SBMNH recovered no known fossil localities within the Project site (SBMNH 2025). However, SBMNH does contain five localities within 5 miles of the Project site. The closest of these localities included two Pacific mastodon (*Mammut pacificus*) specimens recovered approximately 0.8 miles northwest of the Project site.

6 Evaluation, Impacts, and Recommendations

6.1 Paleontological Sensitivity Evaluation

Geologic mapping indicates that the Project site is underlain by three geologic units with FPMS 4 (High) paleontological sensitivity: Quaternary marine terrace deposits, Santa Barbara Formation, and Monterey Formation (Figure 3). Additionally, the Project's geotechnical report (Earth Systems 2013) reported artificial fill, which has no paleontological sensitivity, within the Vic Trace Reservoir parcel. However, Earth Systems (2013) did not map the distribution and depth of artificial fill throughout the Project site, so we cannot be certain where exactly it occurs.

6.2 Impacts

Significant impacts to paleontological resources include the destruction, damage, or loss of scientifically important paleontological resources or associated stratigraphic data. Ground-disturbing activities (i.e., grading, excavating, trenching) in undisturbed sediments or geologic units with high paleontological sensitivity have the potential to significantly impact paleontological resources under CEQA.

Ground-disturbing activities for the Project are anticipated to include excavations for the two new reservoirs, valve vaults, entry/exit pits for pipeline lining, and PRV station; terracing of sloped portions of the reservoir parcel; and open-trenching for new main alignments and storm drains. These activities will affect previously undisturbed, high-sensitivity sediments, and therefore, have the potential to significantly impact paleontological resources.

6.3 Recommendations

The following mitigation measures would address potentially significant impacts under CEQA and maintain compliance with City regulations. These measures would only apply to ground-disturbing activities in previously undisturbed sediments associated with the construction occurring at the Project site. Implementation of the following mitigation actions would effectively mitigate the Project's potentially significant impacts to these resources under CEQA through the recovery, identification, and curation of previously unrecovered fossils.

PAL-1 Worker Environmental Awareness Program

Prior to the start of construction, the Paleontologist or their designee shall conduct a paleontological Worker Environmental Awareness Program (WEAP) training for Project construction personnel regarding the appearance of fossils and the procedures for notifying paleontological staff should fossils be discovered. Project construction personnel shall sign a form provided by the trainer documenting they have attended the WEAP and understand the information presented to them. The construction contractor shall be responsible for ensuring personnel adhere to the guidelines and restrictions designed to avoid impacts to paleontological resources. If new construction personnel associated with ground disturbing activities are added to the Project, the contractor shall confirm the new personnel receive the WEAP training before starting work. The subsequent training

of personnel can include a video recording of the initial training and/or the use of written materials rather than in-person training by the Paleontologist.

PAL-2 Paleontological Resources Monitoring and Mitigation

Prior to start of construction, the City shall retain a Paleontologist meeting the standards for a Paleontological Principal Investigator, as defined by the Society of Vertebrate Paleontology (SVP 2025). The Paleontologist shall draft a Paleontological Resources Mitigation and Monitoring Plan, which shall direct all mitigation measures related to paleontological resources and be sent to the City Environmental Analyst or designee for their review and approval. The Paleontological Resource Mitigation Plan shall include the following:

- Paleontological Monitoring - Monitoring is to be conducted during ground-disturbing construction activities within previously undisturbed sediments assigned high paleontological sensitivity as identified and determined by the Paleontologist. Activities that will exclusively impact artificial fill and/or disturbed sediments will not require paleontological monitoring. Paleontological monitoring shall be conducted by a paleontological monitor with experience with collection and salvage of paleontological resources and who meets the minimum standards of the SVP (2025) for a Paleontological Resources Monitor. The Paleontologist may recommend that monitoring be reduced in frequency or ceased entirely based on geologic observations.
- Fossil Discovery - In the event of a fossil discovery by the Paleontologist, paleontological monitor or construction personnel, all construction activity within 50 feet of the find shall cease. The Paleontologist shall evaluate the find. If the Paleontologist determines the fossil(s) is (are) not scientifically significant, then construction activity may resume. If the Paleontologist determines the fossils may be scientifically significant, the following shall occur:
  - Fossil Salvage - The fossil shall be salvaged (excavated and collected) to protect it from damage/destruction. Typically, fossils can be safely salvaged quickly by a single paleontological monitor with minimal disruption to construction. In some cases, larger fossils (such as complete skeletons or large mammal fossils) require more extensive salvage operations. After fossil salvage is complete, construction activity may resume.
  - Fossil Preparation and Curation - Fossils shall be identified to the lowest (most-specific) possible taxonomic level, prepared to a curation-ready condition, and curated in a fossil repository per SVP (2025) standards, such as the Santa Barbara Museum of Natural History, along with all pertinent data, photos, and/or maps required by the repository.
- Final Paleontological Mitigation Report - Upon completion of ground-disturbing activities (or preparation and curation of fossils, if necessary), the Paleontologist shall prepare a final report describing the paleontological mitigation program's results. The report shall include a summary of the field and laboratory methods employed; an overview of Project geology; and, if applicable, an analysis of the recovered fossils. The report shall be submitted to the City and, if fossil curation occurred, the designated fossil repository.

Appendix A

Staff Resumes

Andrew J. McGrath, PhD

Paleontologist/Project Manager

Dr. McGrath has four years of experience as a paleontological resources consultant and nine years of paleontological research experience, including fieldwork in California and Bolivia, presentations at international research conferences, and multiple first-author publications.

Since joining Rincon in 2021, Dr. McGrath has conducted construction monitoring and field surveys; prepared technical documents (e.g., Environmental Impact Reports, construction monitoring reports, and mitigation plans); led preparation and curation of significant paleontological resources; and helped manage compliance and staffing on large construction projects. These projects have required compliance with various federal (Bureau of Land Management, National Park Service), state (California Energy Commission, Caltrans), and municipal agencies.

EDUCATION

PhD, Earth Science, University of California, Santa Barbara

BA, Biology,
BA, Evolutionary Biology, summa cum laude, Case Western Reserve University, Cleveland, Ohio

YEARS OF EXPERIENCE

CERTIFICATIONS & PERMITS

Principal Investigator, Bureau of Land Management, Paleontology Permit (California)

Qualified Professional Paleontologist, Society of Vertebrate Paleontology

SELECT PROJECT EXPERIENCE

Project Manager/Qualified Paleontologist, Santa Clarita Valley Water Agency – Well 205 Construction Mitigation Project, Los Angeles County (2024-pres.)
Dr. McGrath serves as project manager, which includes coordination of cultural resources mitigation, Native American monitoring, and paleontological monitoring, for this project involving the modernization of a water well in Valencia, California.

Paleontological Oversight, California High-Speed Rail – Construction Package 1 (CP-1), Fresno and Madera Counties (2023-present)
CP-1 of California's high-speed rail system extends from the City of Madera to the City of Fresno. Dr. McGrath is responsible for paleontological mitigation along this segment, including directing monitors, reviewing monitoring logs, managing fossil curation, and creating non-compliance reports or directive letters, as necessary.

Assistant Project Manager/Field Director, ICF Jones & Stokes – State Route 46 Widening Project, Cholame Section, San Luis Obispo County (2022-2023)
This project involved the grading of a new alignment for State Route 46 near Cholame, California. Dr. McGrath drafted the Paleontological Mitigation Plan, served as a paleontological monitor, facilitated fossil curation, and drafted the Paleontological Monitoring Report for this project in accordance with California Department of Transportation standards.

Project Manager/Principal Investigator, Alexandria Real Estate Equities – Campus Pointe Master Plan Entitlements, San Diego County (2022-pres.)
Dr. McGrath serves as Principal Investigator for this project involving the construction of a commercial development in San Diego, California. Dr. McGrath is responsible for ensuring compliance with City of San Diego regulations for paleontological resources. As of June 2025, Dr. McGrath serves as project manager overseeing Project compliance with paleontological, biological, and cultural resources mitigation measures.

Project Paleontologist, Southern California Edison Company – Eldorado-Lugo-Mohave Series Capacitor Project, San Bernardino County (2024-pres)
Dr. McGrath serves as the lead paleontologist for this project involving the construction and implementation of a large-scale utility line in San Bernardino County, California. This project involves collaboration between Southern California Edison and Southern California Gas Company and coordination with the Bureau of Land Management, National Park Service, California State Lands Commission, and California Public Utilities Commission.

Qualified Paleontologist, Chiquita Canyon, LLC – Chiquita Canyon Landfill Environmental Compliance Support, Los Angeles County (2023-pres.)
Dr. McGrath has written annual paleontological monitoring reports, served as paleontological monitor, and overseen fossil laboratory preparation, for ongoing earth-moving activities associated with the operations and development of the Chiquita Canyon Landfill. He has facilitated the salvage, preparation, and curation of dozens of Pliocene and Pleistocene vertebrate and invertebrate fossils to the Natural History Museum of Los Angeles County.

Paleontological Resources Specialist/Paleontologist, Patch Services, LLC – Henrietta Battery Energy Storage System (BESS) Compliance Phase, Kings County (2023-2025)
Dr. McGrath drafted the Paleontological Resources Mitigation Plan in accordance with California Energy Commission (CEC) standards for the construction of a Battery Energy Storage System (BESS) near Lemoore, California. During the construction phase Dr. McGrath served as Paleontological Resources Specialist, conducted paleontological monitoring, and authored the final Paleontological Resources Report.

Qualified Paleontologist, Patch Services, LLC – Tracy BESS Project, San Joaquin County (2024-pres.)
The Tracy BESS project involves the construction of a battery energy storage facility near Tracy, California. Dr. McGrath led the preparation of the paleontological resources assessment within this project's Initial Study and currently oversees paleontological monitoring required by the California Energy Commission and County.

Qualified Paleontologist, Vallecitos Water District – Meadowlark Water Reclamation Facility Project, San Diego County (2023-2025)
Dr. McGrath wrote the paleontological resources section of the Addendum to the 2015 Final PEIR for North San Diego Water Reuse Coalition Regional Recycled Water Project that addressed the Meadowlark Facility. Dr. McGrath also served as Qualified Paleontologist for the project's construction phase including creating the paleontological resources sections of the Workers Environmental Awareness Program, coordinating paleontological monitoring, and writing the paleontological monitoring report.

Subject Matter Expert, Southern California Gas Company – Pipeline Safety Enhancement Plan, Various Counties (2022-pres.)
Dr. McGrath has drafted numerous paleontological resources sections of Detailed Environmental Reports for the Pipeline Safety Enhancement Program, which involves the testing and maintenance of Southern California Gas Company pipelines throughout southern California. This program involves projects that cross numerous municipal, state, and federal jurisdictions.

Paleontological Resources Specialist, Intersect Power – Darden Solar Project, Fresno County (2023-pres.)
This project involves construction of a utility-scale solar energy facility in western Fresno County, California. Dr. McGrath authored the project's paleontological resources assessment. He currently serves as Paleontological Resources Specialist ensuring compliance with paleontological mitigation measures required by the California Energy Commission for which he has prepared a Paleontological Resources Mitigation and Monitoring Program and will oversee paleontological monitoring during construction.

Qualified Paleontologist, Kitchell CEM, Inc. – Cultural Arts District Parking Structure Project, San Luis Obispo County (2022-2024)
The Cultural Arts District Parking Structure Project involved the construction of a new multi-level parking garage in the City of San Luis Obispo. Dr. McGrath authored the Paleontological Resources Mitigation and Monitoring Plan, coordinated and conducted paleontological monitoring, and wrote the paleontological monitoring report.

Paleontologist, Intersect Power – Blythe Mesa Solar II Project, Riverside County (2021-2023)
The Blythe Mesa Solar II project involved the construction of a utility-scale solar energy facility. Dr. McGrath scheduled paleontological monitors, cataloged fossil discoveries, and assessed paleontological monitoring needs on private and federal lands. He also drafted monitoring reports summarizing monitoring efforts for the County of Riverside and Bureau of Land Management.

Paleontologist, Mintier Harnish – City of Rohnert Park General Plan Update EIR, Sonoma County (2022)
Dr. McGrath was responsible for writing the paleontological resources section (Section VII(f)) of the Environmental Impact Report for the City of Rohnert Park General Plan Update.

Christopher Duran, RPA

Principal Investigator/Program Manager

Chris has more than 15 years of professional experience and meets and exceeds the Secretary of the Interior's Professional Qualification Standards. In addition, he has worked throughout California for various municipalities and utility districts assisting in cultural resources investigations for new installations and infrastructure updates. Chris also has extensive experience with the CEQA/NEPA process for cultural resources projects involving water infrastructure maintenance and development throughout California for districts, such as United Water Conservation District, Water Replenishment District of Southern California, Las Virgenes Municipal Water District, the Municipal Water District of Orange County, Metropolitan Water District of Southern California, Eastern Municipal Water District, and West Basin Municipal Water District. Chris is an expert in state and federal regulations as they pertain to cultural resources and serves as Principal Investigator for Rincon's projects providing resource recommendations and mitigation measures allowing clients to remain in sound compliance with applicable regulations. Chris has also been involved in Native American consultation with tribes located in Riverside and San Bernardino Counties and has assisted several local agencies and developers through the consultation processes related to Section 106 of the National Historic Preservation Act and Assembly Bill 52. Chris has authored a variety of cultural resources studies including archaeological survey, archaeological testing and eligibility evaluation, data recovery, mitigation monitoring plans and reports, and peer reviews.

SELECT PROJECT EXPERIENCE

Principal Investigator, County of Ventura – Archaeological Sensitivity Process Review, Ventura County
Chris was the Principal Investigator for the review of the County of Ventura grading permit approval process.

Principal Investigator, City of Palos Verdes – West Basin MWD Palos Verdes Lateral Project, Palos Verdes
Christopher served as a principal investigator for the Palos Verdes Lateral Project in the Palos Verdes area of Los Angeles County area. The project included the survey of potential pipeline alignments within a golf course and residential area. During the project, Christopher had several conversations with Tongva tribal groups identifying potential significant resources in proximity to the golf course that are considered significant to the tribes. Christopher assisted in developing project mitigation measures to address potential impacts and reduce cultural resources impacts to less than significant levels.

Development

Archaeologist, Client – The Marsh Creek Dam Improvement Project, Contra Costa County
Chris analyzed impacts, provided recommendations, and contributed to the Phase I investigation report.

Archaeologist, Client – Sloan Canyon Residential Project, Los Angeles County
Chris conducted a Phase I pedestrian survey and contributed to the Phase I investigation report.

EDUCATION

MA, Anthropology, Northern Arizona University

BS, Anthropology-Cultural Resources Management, Cal State Polytechnic University, Pomona

CERTIFICATIONS/ REGISTRATIONS

Section 106 Compliance (2010)

Advanced Section 106 (2013)

Society for American Archaeology

Society for CA Archeology

PERMITS

Principal Investigator, California Bureau of Land Management statewide FLPMA permit (CA-15-27) (2015-2018)

AFFILIATIONS

Society for American Archaeology

Society for California Archeology

YEARS OF EXPERIENCE

15

Archaeologist, Naval Facilities Engineering Command – Marine Corps Logistics Base, Barstow, Troop Training Expansion Environmental Assessment, City of Barstow
Chris conducted a cultural resources investigation in support of NEPA compliance for the expansion of Marine Corps Logistics Base Barstow.

Field Director, Camp Pendleton, – Stuart Mesa West Phase II Archaeological Investigation, San Diego County
Chris managed field crews for test excavations in San Diego County. Chris also analyzed data, provided NRHP eligibility recommendations for multiple sites, managed collections, and prepared the technical report.

Principal-in-Charge, Sequoia National Forest – Heritage Resource Inventories, Tulare County
Chris served as the Principal-in-Charge for an over $3million inventory of over 28,000 acres for fire restoration and remediation of lands within the Sequoia National Forest burned by the Castle and Windy Fires. The project was completed in compliance with Section 106 and the Region 5 Programmatic Agreement. The study included the intensive pedestrian surveys with a team of approximately 16 field archaeologists. Rincon worked closely with the SQF Heritage Resource staff to identify priority areas and provide the adequate documentation needed to proceed with the restoration activities.

Principal Investigator, Client – Sanchez Adobe Interpretive Center Project, San Mateo County
Chris served as the Principal Investigator for the development of the interpretive center located at the Sanchez Adobe. The effort included ground penetrating radar studies, archaeological trenching, and archaeological testing. The project resulted in the discovery of human remains which prompted some project redesigns with the information provided by Rincon. Chris oversaw the preparation of project reports, quality control, and client communication.

Principal Investigator, City of Malibu – Golf Club and Resort Permitting, Malibu
The project required the cultural resources review for a potential golf club and resort. The study identified one previously recorded resource and two previously recorded historic buildings. The buildings had been burned during the Woolsey Fire and were no longer extant. The study also revealed that the archaeological site was removed during the construction of a man-made lake.

Principal Investigator, County of Ventura – Spanish Springs Housing Development Project, Camarillo
Mr. Duran served as the Principal Investigator for a housing development project within the Spanish Springs golf course to convert the course to a multi-unit housing community. During the course of the study, Rincon coordinated with local Chumash representatives regarding purported cultural resources including villages and rock art sites. The study resulted in a rebuts testing program that allowed the City to adequately address cultural resources issues and proceed with the development project.

Zachary Lerma

Paleontologist

EDUCATION

BS, Earth Sciences, University of California, San Diego

CERTIFICATIONS/ REGISTRATIONS

Bureau of Land Management Paleontological Field Director

Qualified Paleontological Monitor for the City of San Diego

YEARS OF EXPERIENCE

4

Mr. Lerma has four years of experience as a paleontologist. He received his B.S. degree in earth sciences from the University of California San Diego where his studies focused on paleobiology, geology, and geophysics. Mr. Lerma served as a paleontology apprentice at the San Diego Natural History Museum and student research assistant at the Scripps Institution of Oceanography's Paleomagnetic Laboratory. His lab experience includes paleomagnetic data collection as well as the preparation, identification, and cataloging of vertebrate and invertebrate fossils. As an Associate Paleontologist at Rincon Consultants, Mr. Lerma has contributed to IS-MNDs, EIRs and paleontological technical reports for projects throughout California. He has also been involved in residential and public work construction projects as a paleontological monitor in southern and central California.

SELECT PROJECT EXPERIENCE

Paleontologist, Southern California Edison – ELM Cathodic Protection, Riverside County (2025)
Paleontologist for a paleontological survey on Bureau of Land Management land. Tasks included planning daily survey schedule, identifying geologic units, recording geologic descriptions and organization of digital survey data. Field Weeks: 1

Paleontological Monitor, Intersect Power – Blythe Mesa Solar Project, Blythe (2021-2022)
Paleontological Monitor for the construction of multiple large scale photovoltaic arrays on Bureau of Land Management land. Tasks included construction monitoring for paleontological resources, final monitoring report preparation, and organization of daily monitoring logs. Field Weeks: 4

Intake Analyst, Southern California Edison (SCE)- Environmental Compliance Program, Southern California (2021-2024)

Prepared environmental requirement documents for environmental analysis on SCE public and private distribution and transmission construction projects. Prepared project descriptions for projects on public lands including Bureau of Land Management, National Park Service, and United States Forest Service. Issued finalized environmental requirement documents for construction projects. Field Weeks: N/A

Paleontological Monitor, Alexandria – Campus Pointe, San Diego (2022-2024)

Paleontological Monitor for a 4.49-acre corporate development project in the City of San Diego. Tasks included monitoring for mass excavation and trenching operations for paleontological resources, coordinating with construction management, and organizing daily monitoring logs. Prepared and organized fossils for submission to the Natural History Museum of Ls Angeles County. Field Weeks:20

Paleontological Monitor, Vallecitos Water District – Meadowlark WRP Expansion, Carlsbad (2025)

Paleontological Monitor for the expansion of a water reclamation plant in the City of Carlsbad. Tasks included monitoring for mass excavation for paleontological resources and coordinating with construction management. Field Weeks: 3

Paleontologist, Southern California Edison- Cal City Substation 115 kV Upgrade Project, Kern and San Bernardino Counties (2023)

Mr. Lerma was responsible for conducting a paleontological survey for the analysis of several proposed routes for new and upgraded utility lines near California City. Survey areas were mapped as areas mapped as Holocene and Pleistocene alluvial, playa, eolian sediments, Tropico Group, and Mesozoic plutonic rocks.

Field Weeks:1

Paleontological Monitor and Monitoring Report Co-Author, Holland Construction – Courthouse Commons South Block, San Diego (2021)

Paleontological Monitor and Monitoring Report Co-Author for a 37-floor residential building construction in downtown San Diego's Civic Center. Tasks included monitoring excavation activities for paleontological resources, preparation and curation of recovered fossils, final monitoring report preparation, and frequent coordination with the San Diego Natural History Museum's Paleontology department for fossil collection submittal. Field Weeks: 12

Paleontological Monitor, California Rail Authority- California Highspeed Rail, Construction Package 1, Segment D (CP-1D), Madera County. (2022-2024)

Paleontological Monitor for trenching activities related to railway construction for a large-scale transportation project. Responsibilities included monitoring for paleontological resources and recording daily monitoring logs. Prepared paleontological sections of environmental re-examination documents. Field Weeks: 1

Paleontological Monitor and Monitoring Report Co-Author, Blue Pacific Engineering and Construction – Sewer Group 776A, San Diego (2021)

Paleontological Monitor and Monitoring Report Co-Author for a sewer line renovation in the City of San Diego's Oak Park community. Mr. Lerma monitored trenching operations and discovered several marine invertebrate specimens. Mr. Lerma curated the specimen and prepared the monitoring report. Field Weeks: 12

Staff Paleontologist, Murphy's Bowl, Inglewood (2021)

Staff Paleontologist for a sports arena construction project in Inglewood, CA. Mr. Lerma curated and prepared terrestrial vertebrate fossils recovered from monitoring of construction activity. Field Weeks: 1

Paleontologist and Co-Author, Begonia Real Estate Development – Foothill Boulevard and Tokay Avenue Residential Project Initial Study-Mitigated Negative Declaration, Fontana (2021)

Report Co-Author for an IS-MND for a 421-unit multi-family residential community in Fontana, California. Tasks included preparation of the paleontological resource assessment, mitigation measures, and geologic figures. Field Weeks:0

Paleontologist, 8minut Energy – Sienna Solar Project, San Bernardino County (2021)

Paleontologist for a 2,484-acre solar farm in unincorporated San Bernardino County. Tasks included coordination with the Natural History Museum of Los Angeles County for paleontological locality data within the project site and surrounding areas. Field Weeks: 0

Staff Paleontologist and, Douglas Herring and Associates – Richmond Townhomes Paleontological Memorandum, Richmond (2021)

Staff Paleontologist for a 4-acre residential development in Richmond, Ca. Tasks included conducting a paleontological assessment, preparing geologic figures, and writing sections of the paleo memo. Field Weeks: 0

Staff Paleontologist, City of Belmont – Belmont Housing Element EIR, Belmont (2021)

Staff Paleontologist for a city-wide housing plan in Belmont Ca. Mr. Lerma assisted in the design of geologic figures and performed a paleontological analysis of geologic units within the city. 2 weeks

Staff Paleontologist, Tulare County Association of Governments – TCAG Regional Transportation and Sustainable Communities EIR, Tulare County (2021)

Staff Paleontologist for a county-wide transportation development plan in Tulare County, Ca. Mr. Lerma performed research and paleo analysis for the entire county. His work resulted in an analysis of over 15 unit in two geologic provinces. 3 weeks

1 INTRODUCTION

In accordance with your request, we have performed a geotechnical evaluation for the City of Santa Barbara's Vic Trace Reservoir Replacement project located south of La Coronilla Drive in Santa Barbara, California (Figure 1). Our geotechnical evaluation was performed in conformance with Chapter 18A of Title 24, Part 2, Volumes 1 and 2 of the 2022 California Building Code (CBC), the American Society of Civil Engineers (ASCE) 7-22 standard, and the D110-13 American Water Works Association (AWWA) standard. This report presents the results of our field explorations and laboratory testing as well as our conclusions regarding the geotechnical conditions at the site and our recommendations for the design and construction of this project.

2 SCOPE OF SERVICES

Our scope of services for this evaluation included the following:

- Reviewing readily available published and in-house geologic and geotechnical literature, topographic maps, geologic maps, fault maps, flood zone maps, and historical stereoscopic aerial photographs.
- Performing a field reconnaissance to observe site conditions and to mark the boring and test pit locations.
- Notifying Underground Service Alert (USA) to clear boring locations for the potential presence of underground utilities. In addition, a private utility locating company was used to clear the exploration locations for the potential presence of underground utilities.
- Performing a subsurface exploration program consisting of the following:
    - Drilling, logging, and sampling of eighteen exploratory borings. Relatively undisturbed drive and bulk soil samples of the materials encountered were collected at selected intervals from the borings and transported to our in-house geotechnical laboratory for testing.
    - Excavating, logging, and sampling of six test pits. Bulk soil samples of the materials encountered were collected at selected intervals from the test pits and transported to our in-house geotechnical laboratory for testing.
    - Performing infiltration tests in three of the exploratory borings in general accordance with the City of Santa Barbara 2020 Storm Water BMP Guidance Manual.
    - Performing a Refraction Microtremor (ReMi) survey.
- Performing geotechnical laboratory testing on representative samples to evaluate soil characteristics and parameters for design purposes.
- Coordinating with an analytical laboratory for testing on select soil samples.
- Compiling and performing engineering, slope stability, and site-specific ground motion analyses using information obtained from our background review, subsurface exploration, and laboratory testing.

DRAFT

- Preparing this geotechnical report presenting our findings, conclusions, and geotechnical recommendations for the design and construction of this project.

3 SITE AND PROJECT DESCRIPTION

The project site is located south of La Coronilla Drive and east of Dolores Drive in the Alta Mesa neighborhood of Santa Barbara, California (Figures 1 and 2). The site is situated at the top of Lavigia Hill and is generally surrounded by residential properties. The site supports an existing reservoir that consists of a 10.0-million gallon (MG), buried, hopper bottom, concrete-lined reservoir with associated piping. The reservoir extends approximately 20 feet in depth and has an overall footprint of approximately 380 feet by 250 feet. Associated outbuildings, including a valve building and generator building, are located northeast of the reservoir.

An asphalt concrete (AC) access road extends south from La Coronilla Drive to the reservoir access gate on the north side of the reservoir. Topographically, the site includes a relatively level pad that surrounds the existing reservoir and is bounded by gentle to moderately steep slopes. The surface elevation of the level pad is approximately 465 feet above mean sea level (MSL). The adjacent natural and fill slopes descend down from the reservoir at inclinations generally 2:1 (horizontal: vertical) or flatter. These slopes range from approximately 10 to 120 feet in height.

DRAFT

We understand that the existing reservoir will be replaced by a new reservoir structure in roughly the same location with the same 10.0-MG capacity. While multiple design alternatives are being considered, the current preferred alternative consists of two 206-foot diameter, 5.0-MG, prestressed concrete tanks. The new reservoir tanks will also be buried, with a finish floor elevation of approximately 432 feet above MSL and a bottom of footing elevation of approximately 428 feet above MSL. Additionally, the project will also include the construction of new valve and generator buildings, retaining walls, solar structures, piping to and from the new tanks, as well as the replacement and resizing of existing pipelines and utilities. In general, traditional cut-and-cover trenching techniques are anticipated for the installation of the piping and utilities. Multi-purpose buildings may also be constructed at the site at a future date.

As part of the reservoir replacement project, new water conveyance pipelines and a new PRV station are to be constructed. These new improvements will generally be located along La Coronilla Drive and Dolores Drive (Figure 3).

4 BACKGROUND AND PREVIOUS REPORTS

The existing Vic Trace Reservoir was constructed in the mid 1950's. As part of the reservoir construction, cuts into the existing hillside were made and fill embankments were built up on the

northwest and southwest sides of the reservoir. We understand that the hopper bottom and most of the side portions of the reservoir were constructed within the cut hillside.

Prior to reservoir construction, an oil well was drilled on the site. According to records available from the State of California Department of Conservation, Geologic Energy Management Division (CalGem), the well was identified as “Beckstead” 1 and was drilled by Dralock Oil Company in August and September of 1935. The approximately 11-inch diameter well was drilled in the vicinity of the north corner of the existing reservoir to a total depth of 1,578 feet and then abandoned as no oil or gas showings were encountered. Abandonment included placement of heavy mud to a depth of approximately 134 feet, then a cement plug to a depth of approximately 75 feet, followed by placement of heavy mud to the surface.

In 2013, a geotechnical study of the reservoir site was conducted by Earth Systems Southern California (ESSC) to evaluate voids that had formed in the reservoir embankments. As part of their study, a ground penetrating radar survey was performed in the paved area around the reservoir and total of three large dimeter borings, seven small diameter borings, and four backhoe test pits were performed at the site. Based on the results of their study, ESSC (2013) concluded that voids had formed within the reservoir embankments due to a combination of poor drainage, cracked pavements, and extensive animal burrows that allowed water to erode subsurface soils. To address the drainage conditions, ESSC recommended pavement repairs, backfill of voids, installation of animal barriers, and reconstruction of some fill slopes. The results of ESSC’s 2013 study are incorporated herein, where appropriate.

DRAFT

5 FIELD EXPLORATIONS

Our field exploration activities included a subsurface exploration program, a geophysical survey, and infiltration testing. Descriptions of these tasks are provided in the following sections.

5.1 Subsurface Exploration

Our subsurface exploration at the site was conducted from August 5, 2024 to August 9, 2024, and consisted of the drilling, logging, and sampling of eighteen exploratory borings (B-1 through B-15 and IT-1 through IT-3) and the excavation, logging, and sampling of six exploratory test pits (TP-1 through TP-6). Prior to commencing the subsurface exploration, the locations were cleared of underground utility conflicts by Underground Service Alert. In addition, a private utility locator was retained to clear the boring and test pit locations for the potential presence of underground utilities. The purpose of the borings and test pits was to evaluate the subsurface conditions and to collect soil samples for laboratory testing.

Borings B-1, and B-4 through B-15 were drilled to depths up to approximately 52 feet using a truck-mounted drill rig equipped with 8-inch diameter, hollow-stem augers. Borings B-2 and B-3 were drilled to depths of approximately 31½ feet using a limited-access, track-mounted drill rig equipped with 8-inch diameter, hollow-stem augers. Due to the presence of an unmarked utility, multiple attempts were made to drill boring B-14. Borings IT-1 through IT-3 were manually excavated to depths up to approximately 4½ feet using a 6-inch dimeter hand auger. Test pits TP-1 through TP-6 were excavated to depths up to approximately 10 feet using an excavator equipped with a 30-inch bucket. Representative bulk and in-place soil samples were collected at selected depths from within the exploratory borings and test pits and were transported to our in-house geotechnical laboratory for analysis. Ninyo & Moore personnel logged the borings and test pits in general accordance with the Unified Soil Classification System (USCS) and ASTM International (ASTM) Test Method D 2488 by observing cuttings and drive samples. The approximate locations of the borings and test pits are shown on Figures 2 through 4, and the boring and test pit logs are presented in Appendix A.

5.2 Geophysical Survey

DRAFT

As part of our field exploration, we performed a geophysical Refraction Microtremor (ReMi) survey at the site on June 6, 2024. The purpose of the ReMi survey was to evaluate the shear wave velocity profile of the upper 100 feet of soil to assign the Seismic Site Class.

The ReMi survey utilized the passive seismic method of Microtremor Array Measurements (MAM) and consisted of one linear profile of seismic data collection. As shown on Figures 2 and 4, the profile was generally oriented east to west and located along the northeast side of the reservoir. The method provided a shear wave velocity model to a depth of approximately 100 feet (30 meters) which was then used to calculate the average shear wave velocity (V_{s30}) to select the seismic site class. The following sections provide a summary of the methods and analyses used in our study. The seismic model results are provided in Appendix B.

5.2.1 Field Methods

A Geode 24–Channel Seismograph was used for MAM surveying, with 4.5 Hertz (Hz) vertical component geophone placement every 10 feet for a total profile length of 230 feet. Approximately 40 records were collected, with a record length of 30 seconds and 2 millisecond sample intervals. The field data were digitally recorded in SEG2 format, reviewed in the field for data quality, and saved electronically.

5.2.2 Data Processing and Modeling

The MAM seismic data were processed using SeisImager/SW Analysis of Surface Waves software. The dispersive characteristics of surface waves are used to evaluate the subsurface velocity at depth. Longer wavelength (longer-period and lower-frequency) surface waves travel deeper and thus contain more information about deeper velocity structure. Shorter wavelength (shorter-period and higher-frequency) surface waves travel shallower and thus contain more information about shallower velocity structure. The dispersion is dependent on the material properties, such as surface wave velocity, relative material densities, and Poisson's ratio. An inversion is performed on the collected passive seismic shear wave records within SeisImager to produce a model of the variation in shear wave velocities with depth. The following data processing flow was used to calculate V_{s30} in accordance with the American Society of Civil Engineers (ASCE) 7-16 and 7-22 guidelines and equations.

- Collated records into list file and edited any bad channels or records;
- Applied 2D Spatial Auto Correlation (SPAC), using a linear array and 24 geophones at 4-meter spacing;
- Phase velocity frequency transformation from 2 to 35 Hz;
- Automated velocity picks of raw phase velocity were calculated and updated manually;
- Created an initial model and carried out a non-linear Least Squares Method (LSM) inversion to produce a final shear wave velocity model; convergence of the inversion was judged whether the model achieved an RMS <5% within 5-7 iterations;
- Calculated V_{s30} using final shear wave velocity model to be 1,035 feet per second (fps).

DRAFT

5.3 Infiltration Testing Survey

As means of evaluating the infiltration characteristics of the near-surface materials, infiltration tests were performed within borings IT-1 through IT-3 (Figure 2). Borings IT-1 through IT-3 were excavated to depths up to approximately 5 feet using a 6-inch diameter auger. Following their excavation on August 7, 2024, the locations were prepared for infiltration testing by placing approximately 2 inches of gravel on the bottom, installing a 2-inch diameter perforated PVC pipe, and backfilling the annulus with pea gravel. As part of the test procedure, a presoak was performed on August 7, 2024 to represent adverse conditions for infiltration. The presoak consisted of maintaining approximately 1 foot of water in each test boring for approximately 4 hours and then allowing to drop overnight.

Infiltration testing was then performed on August 8, 2024 in general accordance with the City of Santa Barbara BMP Design Manual (2020). Infiltration tests IT-1 through IT-3 were filled with

approximately 24 to 30 inches of water and the water depth was measured in 25-minute intervals for the first reading. Testing then proceeded at 10-mintute intervals for the duration of test IT-1 and 30-minute intervals for the duration of the tests for IT-2 and IT-3.

Infiltration rates were calculated using the Porchet method. Infiltration tests IT-1 through IT-3 indicated observed (i.e., unfactored) infiltration rates ranging from 0.06 inches per hour to 0.30 inches per hour (once corrected for gravel).

Table 1 summarizes the results of the infiltration testing. The field measurements and calculations are included in Appendix C. The rates presented in Table 1 are to be used for preliminary design purposes.

Table 1 – Infiltration Test Summary

Infiltration Test	Approximate Test Depth (feet)	Description	Observed Infiltration Rate (in/hr)
IT-1	4.5	Sandy CLAY (Colluvium)	0.30
IT-2	4.5	Silty SAND (Fill)	0.20
IT-3	3.5	Sandy CLAYSTONE (Santa Barbara Formation)	0.03

Notes:
in/hr = inches per hour

DRAFT

We note that the in-situ infiltration rates presented in Table 1 represent the infiltration rates at the specific locations and depths indicated in the table. Variation in the infiltration rates can be expected at different depths and/or locations from those shown in the table.

6 LABORATORY TESTING

In-place and bulk soil samples collected from our borings and test pits were transported to our-in house geotechnical laboratory. Geotechnical laboratory testing of selected soil samples consisted of an evaluation of in-situ moisture content and dry density, sieve analysis, consolidation, shear strength, expansion index, soil corrosivity, and R-value. Results of the in-situ moisture content and dry density tests are shown at the corresponding sample depths on the boring and test pit logs in Appendix A. The results of the other laboratory tests and a description of the test methods used are presented in Appendix D.

Additionally, analytical laboratory testing of the select samples collected from boring B-1 was performed by a subcontracted laboratory (American Environmental Testing Laboratory). The

analytical testing was performed to screen for total petroleum hydrocarbons related to the oil was that was previously drilled on site. These laboratory test results are provided in Appendix E.

7 GEOLOGY AND SUBSURFACE CONDITIONS

Our findings regarding regional and site geology at the project location are provided in the following sections.

7.1 Regional Geologic Setting

The project area is situated in the coastal terrace section of the transverse Ranges Geomorphic Province. This geomorphic province encompasses an area that extends approximately 300 miles from the Pacific Ocean in the west to the Mojave Desert Province in the east (Norris and Webb, 1990; Harden, 2004). The province varies in width from approximately 20 to 70 miles. In general, the province consists of rugged east-west trending mountains with deeply eroded stream channels. The age of the underlying rocks generally gets progressively older from the west to the east and consists of Mesozoic plutonic rocks and Precambrian metamorphic rocks.

DRAFT

The Transverse Ranges Province is predominantly traversed by east-west trending folds and faults (Jennings, 2010). Several of these faults, which are shown on Figure 5, are considered active faults. Active fault systems in the project area include the Mission Ridge-Arroyo Parida-Santa Ana, Santa Ynez, San Cayetano, and San Andreas faults to the north and northeast, and the Red Mountain, Oak Ridge, Pitas Point, and Santa Cruz Island faults to the south and southeast. The Mission Ridge-Arroyo Parida-Santa Ana Fault Zone, the nearest active fault system, has been mapped approximately 3 miles northeast of the project site. Major tectonic activity associated with these and other faults within the regional tectonic framework consists primarily of dip-slip movement in the form of reverse and thrust faulting, along with lesser oblique and strike-slip fault movement. Further discussion of faulting relative to the site is provided in the Faulting and Seismicity section of this report.

7.2 Site Geology

Geologic units encountered during our field reconnaissance and subsurface exploration included fill, topsoil, colluvium, terrace deposits, and Santa Barbara Formation. Generalized descriptions of the earth units encountered during our subsurface exploration and mapped at the site are provided below. Additional descriptions are provided on the boring and test pit logs in Appendix A. The geology of the site vicinity is shown on Figure 6. A geotechnical map of the reservoir site is presented in Figure 4 and geologic cross sections are shown on Figures 7A through 7D.

7.2.1 Fill

Fill materials were encountered underneath the AC pavements or at the ground surface in borings B-1 through B-3, B-5 through B-9, B-11 through B-15, IT-1 through IT-3, and test pits TP-1 through TP-4, and TP-6. Encountered fill depths within the embankment area were up to approximately 23 feet, with the deepest fill encountered on the west side of the reservoir in boring B-2. Outside of the reservoir site (borings B-10 through B-15), the encountered fill depths were approximately 8 feet. As encountered, the fill materials generally consisted of various shades of brown and yellow, dry to moist, firm to very stiff, clayey silt and lean clay and very loose to dense, silty sand and clayey sand. Varying amounts of gravel and cobbles were encountered in the fill materials. Concrete debris was also encountered in the fill in borings B-7 and B-14. Due to drilling refusal at approximately 4¾ feet on a possible utility, multiple attempts were made to drill boring B-14. As observed in IT-1 and our test pits, ant and gopher burrows were observed in the upper approximately 2 feet of the fill materials.

7.2.2 Colluvium

DRAFT

Colluvium was encountered at the surface or beneath the fill material in boring IT-1 and test pits TP-4 and TP-5. As encountered, these materials generally consisted of various shades of brown, moist, stiff to very stiff, sandy lean clay and medium dense clayey sand. Within TP-5, gopher burrows were observed in the colluvium to depths of up to approximately 2 feet.

7.2.3 Terrace Deposits

Quaternary age terrace deposits were encountered in boring B-13, performed on Dolores Drive, underlying the fill materials and extending to the depths explored. As encountered, the terrace deposits generally consisted of brown and yellow, moist, medium dense to dense, silty sand and clayey sand. Trace amounts of gravel were encountered in the terrace deposits.

7.2.4 Santa Barbara Formation

Materials of the Quaternary-age Santa Barbara Formation (Johnson et al., 2013), was encountered at the surface or underlying the pavements, fill, and/or colluvium in borings B-1 through B-6, B-8 through B-12, B-15 and IT-3, and in test pits TP-5 and TP-6 and extending to the total depths explored. As encountered in our borings and test pits, these materials generally consisted of yellow, gray, and various shaded of brown, moist, moderately to indurated, claystone and weakly to strongly cemented, sandy siltstone and silty and clayey sandstone.

As indicated on the referenced geologic maps, the project area is on the limb of a northwest-southeast trending anticline, where bedding dips within the Santa Barbara Formation range from approximately 4 to 29 degrees to the south and southwest. While bedding attitudes of the Santa Barbara Formation were not observed during our subsurface evaluation, previous measurements within the large diameter borings performed at the reservoir site indicated variable bedding (ESSC, 2013). Within the same borings, bedding was observed to dip both to the north and south, at inclinations of 12 to 15 degrees.

7.3 Groundwater

Groundwater was not encountered at the time of our subsurface exploration. Based on a review of nearby well records (Campbell Geo, Inc, 2004; Geotracker, 2024) groundwater is estimated to be at an elevation of approximately 180 feet above MSL or lower (i.e., greater than 100 feet below the bottom of the reservoir). Perched water conditions should be anticipated. These conditions may occur due to the geologic contact between the fill and formational soils, as well as the presence of trench backfill and bedding materials for underground utilities, as these materials tend to act as a conduit for perched water conditions. Fluctuations in the groundwater level and perched conditions may occur due to variations in ground surface topography, subsurface geologic conditions and structure, rainfall, irrigation, and other factors.

DRAFT

7.4 Flood Hazards

Based on review of the Federal Emergency Management Agency Flood Insurance Rate Map ([FIRM], FEMA, 2018), the site is mapped as lying outside of 100- and 500-year flood zones. Based on this review and our reconnaissance, the potential for flooding to impact the site is considered low.

7.5 Landslides

Based on our review of referenced geologic maps, literature, topographic maps, and stereoscopic aerial photographs, no landslides or indications of deep-seated landsliding underlie the site. As such, the potential for significant large-scale slope instability at the site is not a design consideration. However, shallow surficial failures were noted at the reservoir site during our site reconnaissance. The shallow slope failures were observed near the northwestern portion of the site, on the lower portion of the reservoir embankment. This area was identified previously and described as a “debris flow” that likely formed in the mid 1990’s (ESSC, 2013).

8 FAULTING AND SEISMICITY

Based on our review of the referenced geologic maps and stereoscopic aerial photographs, as well as on our geologic field mapping, the site is not underlain by known active or potentially active

faults (i.e., faults that exhibit evidence of ground displacement in the last 11,000 years and 2,000,000 years, respectively) (Hart and Bryant, 2007). However, like the majority of southern California, the site is located in a seismically active area and the potential for strong ground motion is considered significant during the design life of the proposed structures. The nearest known active fault is the Mission Ridge-Arroyo Parida-Santa Ana fault, located approximately 3 miles northeast of the site. Table 2 lists selected principal known active faults that may affect the subject site, including the approximate fault-to-site distances, and the maximum moment magnitudes (Mmax) as published by the USGS (2024a).

Table 2 – Principal Active Faults

Fault	Approximate Fault-to-Site Distance [miles (kilometers)]	Maximum Moment Magnitude (M_{max})
Mission Ridge-Arroyo Parida-Santa Ana	2.9 (4.6)	6.9
Red Mountain	3 (5)	7.4
North Channel	6 (10)	6.8
Pitas Point (Upper)	6 (10)	6.9
Santa Ynez (West)	7 (12)	7.0
Santa Ynez (East)	8 (13)	7.2
Ventura-Pitas Point	10 (16)	7.0

DRAFT

8.1 Seismic Site Class

As previously discussed, we performed a ReMi survey to evaluate the shear wave velocity profile for the site in order to select the appropriate Seismic Site Class. ReMi shear wave data resolution generally decreases with depth, due to the loss of sensitivity of the dispersion curve to changes

in shear wave velocity as depth increases. A figure showing our MAM seismic modeling results are provided in Appendix B. The layered models in Appendix B indicate our interpretation of the approximate changes in shear wave velocity vertically with depth across the surveyed location. These results are then used to calculate the Vs30, which is defined as the average shear wave velocity for the upper 100 feet (30 meters) of the soil, in accordance with ASCE 7-16 and 7.22 guidelines. The results indicate a Vs30 value of 1,035 fps, which according to ASCE 7-16 Table 20.3-1, corresponds to Seismic Site Class D. The results indicate a Vs30 value of 1,035 fps, which according to ASCE 7-22 Table 20.2-1, corresponds to Seismic Site Class CD.

8.2 Surface Ground Rupture

Based on our review of the referenced literature and our field evaluation, no active faults are known to cross the project vicinity. Therefore, the potential for ground rupture due to faulting at the project site is considered low. However, lurching or cracking of the ground surface as a result of nearby seismic events is possible.

DRAFT

8.3 Strong Ground Motion

Considering the proximity of the site to active faults capable of producing a maximum moment magnitude of 6.0 or more, the project area has a high potential for experiencing strong ground motion. The California Building Code (CBC) specifies that the risk-targeted maximum considered earthquake (MCE_R) ground motion response accelerations may be used to evaluate seismic loads for design of buildings and other structures.

A refraction microtremor (ReMi) geophysical survey was performed as part of our subsurface evaluation. Based on the results of the ReMi survey, the V_{S30} at the site is calculated to be approximately 315 meters per second (1,035 feet per second). In accordance with Chapter 20 of the American Society of Civil Engineers (ASCE) Publication 7-22 (2022) for the Minimum Design Loads and Associated Criteria for Building and Other Structures, the site classification is Site Class CD (dense sand or very stiff clay).

In accordance with ASCE 7-22, the multi-period MCE_R ground motion response accelerations were determined using the USGS Seismic Design Geodatabase accessed through the ASCE 7 Hazard Tool (2024b). The multi-period MCE_R ground motion response accelerations are based on the spectral response accelerations in the direction of maximum horizontal response represented by a 5 percent damped acceleration response spectrum that is expected to achieve a 1 percent probability of collapse within a 50-year period with deterministic limits. Figure 8 presents the multi-period MCE_R response spectrum and the multi-period design response spectrum.

ASCE 7-22 specifies that the potential for liquefaction and soil strength loss be evaluated, where applicable, for the mapped maximum considered earthquake geometric mean (MCE_G) peak ground acceleration adjusted for site effects (PGA_M). The MCE_G PGA_M is based on the geometric mean peak ground acceleration with a 2 percent probability of exceedance in 50 years. The PGA_M for the site was calculated as 1.05g using the ASCE 7 Hazard Tool (2024).

8.4 Liquefaction

Liquefaction of cohesionless soils can be caused by strong vibratory motion due to earthquakes. Research and historical data indicate that loose granular soils and non-plastic silts that are saturated by a relatively shallow groundwater table are susceptible to liquefaction. Based on the absence of a shallow groundwater table and the relatively dense nature of the Santa Barbara Formation materials encountered in our borings, it is our opinion that the potential for liquefaction to occur at the site is not a design consideration.

8.5 Tsunamis and Seiches

DRAFT

Tsunamis are long wavelength seismic sea waves (long compared to the ocean depth) generated by sudden movements of the ocean bottom during submarine earthquakes, landslides, or volcanic activity. Seiches are similar oscillating waves on inland or enclosed bodies of water. Based on the inland location and elevation of the site, and the distance to nearby lakes or reservoirs, the potential for a tsunami or seiche to affect the site is not a design consideration.

9 CONCLUSIONS

Based on our review of the referenced background data, the subsurface exploration, and geotechnical laboratory testing, it is our opinion that construction of the proposed project is feasible from a geotechnical standpoint provided the recommendations presented in this report are incorporated into the design and construction of the project. In general, the following conclusions were made:

- The project site is generally underlain by varying depths of existing fill and colluvium, which are in turn underlain by terrace deposits or materials of the Santa Barbara Formation.
- Groundwater was not encountered during our subsurface exploration. However, perched water conditions and seepage should be anticipated.
- The onsite fill materials and Santa Barbara Formation are considered to be generally excavatable with heavy-duty earth moving equipment in good working condition. Gravel and cobbles will be encountered and additional efforts including heavy ripping should be anticipated.

- Soils derived from onsite excavations are anticipated to generate gravel and cobbles. Onsite soils may be suitable for reuse as engineered fill, provided they are processed in accordance with the recommendations of this report. Additional processing and handling of materials including screening, rock-picking, and/or crushing should be anticipated.

- The closest known active fault, the Mission Ridge-Arroyo Parida-Santa Ana fault, has been mapped approximately 3 miles northeast of the site. No active faults are reported underlying the subject site. Therefore, potential for ground rupture due to faulting at the site is considered low.

- Our recent laboratory testing indicates that the onsite clayey fill soils possess a medium potential for expansion. Medium to very highly expansive materials are not suitable for reuse. The contractor should be prepared and anticipate using import soils for portions of the project.

- Based on the results of our geotechnical laboratory testing as compared to the Caltrans (2021) corrosion guidelines the onsite soils are considered corrosive. We recommend a corrosion engineer be consulted for mitigation recommendations during the design of the proposed improvements.

10 RECOMMENDATIONS

DRAFT

The following recommendations are provided for the design and construction of the proposed project. These recommendations are based on our evaluation of the site geotechnical conditions and our assumptions regarding the proposed development. Ninyo & Moore should be contacted for questions regarding the recommendations or guidelines presented herein.

10.1 Earthwork

In general, earthwork should be performed in accordance with the recommendations presented in this report. The geotechnical consultant should be contacted for questions regarding the recommendations or guidelines presented herein.

10.1.1 Site Preparation

Site preparation should begin with the removal of existing improvements, vegetation, utility lines, asphalt, concrete, and other deleterious debris from areas to be graded. Tree stumps and roots should be removed to such a depth that organic material is generally not present. Clearing and grubbing should extend to the outside of the proposed excavation and fill areas. The debris and unsuitable material generated during clearing and grubbing should be removed from areas to be graded and disposed of at a legal dumpsite away from the project area, unless noted otherwise in the following sections.

10.1.2 Excavation Characteristics

The results of our background review and field exploration program indicate that the reservoir site is underlain by varying depths of fill soils and colluvium in turn underlain by the Santa Barbara Formation. Outside of the reservoir site, the new pipelines and PRV station are underlain by varying depths of fill in turn underlain by terrace deposits and/or the Santa Barbara Formation. Excavation of the fill materials. Colluvium, terrace deposits, and Santa Barbara Formation should be generally achievable with heavy-duty earth moving equipment in good working condition. Due to the presence of gravel, cobbles, and similar sized rock fragments, additional efforts including heavy ripping should be anticipated. Excavations (including utility trenches) may generate oversize material and additional processing and handling of these materials including screening, rock picking, and/or crushing should be anticipated. Furthermore, the contractor should anticipate potential caving of open excavations (e.g., trenches, drilled excavations), particularly where cohesionless soils are encountered, or where excavations are not promptly backfilled.

DRAFT

10.1.3 Excavation Bottom Stability

Based on our exploratory borings, the bottoms of excavations expose existing compacted fills and competent colluvium, terrace deposits, and materials of Santa Barbara Formation are generally anticipated to be stable. However, if excavations are left open, disturbed, and exposed to long term moisture, the bottoms may become unstable and require mitigation by overexcavating the bottom to suitable depths (as evaluated in the field by the geotechnical consultant) and replacing with engineered fill or a layer of compacted ¾- to 1½ inch crushed gravel encased in a woven geotextile (e.g., Mirafi® 600X geotextile or an approved equivalent). Specific recommendations for stabilizing excavation bottoms should be based on evaluation in the field by the geotechnical consultant at the time of construction.

10.1.4 Temporary Excavations

Based on information provided to our offices, we understand that the new reservoir tank is anticipated to be up to 35 feet tall, with most of the structure being buried below ground. Accordingly, to accommodate the construction of the structure, we anticipate that temporary construction slopes greater than 20 feet in height may be used, therefore the standard Occupational Safety and Health Administration (OSHA) soil classifications are no longer applicable. To evaluate temporary construction slopes, we have performed global slope stability analyses using the two-dimensional stability analysis program Slope/W (GeoStudio, 2020). Specifically, analyses were performed to evaluate temporary construction slopes in both the fill and the Santa Barbara Formation.

The fill and materials of the Santa Barbara Formation were assigned unit weight and peak shear strength parameters based on the laboratory testing presented in Appendix D. The relevant shear strength parameters used in our slope stability analysis are presented in Table 3.

Table 3 – Slope Stability Design Parameters

Geologic Unit	Unit Weight (pcf)	Cohesion (psf)	Friction Angle (degrees)
Fill	114	110	29
Santa Barbara Formation	118	200	27

Notes:
pcf = pounds per cubic foot
psf = pounds per square foot

The results of our global slope stability analyses of the temporary construction slopes indicate adequate factors of safety (i.e., about 1.25 or higher under the static loading condition) for temporary slopes at inclinations of 1½:1 (horizontal to vertical) in the fill and 1:1 in competent materials of the Santa Barbara Formation. The results of our global stability analyses are presented in Appendix F.

DRAFT

Temporary excavations should be constructed in accordance with OSHA recommendations. For trenches or other excavations, OSHA requirements regarding personnel safety should be met. Temporary excavations that encounter seepage may be shored or stabilized by placing sandbags or gravel along the base of the seepage zone. Excavations encountering seepage should be evaluated on a case-by-case basis. Onsite safety of personnel is the responsibility of the contractor.

10.1.5 Temporary Shoring

We understand a shoring system may be incorporated to the project support excavation sidewalls during construction. Particular caution should be used near existing underground utilities. Existing utilities that are located within a zone based on a 1:1 plane projected up from the bottom outside edge of the new trench should be considered at risk. The type of shoring and sequence of shoring installation should be designed to protect utilities and surface improvements.

Lateral earth pressures exerted on restrained shoring systems are indicated on Figure 9 and Figure 10 for cantilevered shoring systems. The recommended design earth pressures are based on the assumptions that: (a) the shoring system is constructed without raising the ground surface elevation behind the shoring, (b) there are no surcharge loads, such as soil stockpiles, construction materials, or vehicular traffic, and (c) no loads act above a 1:1 plane extending up and back from the base of the shoring system. For shoring subjected to the above-mentioned

surcharge loads, the contractor should include the effect of these loads on lateral earth pressures acting on the shoring wall.

Settlement of the ground surface may occur behind the shoring wall system during excavation. The amount of settlement depends on the type of shoring system, the quality of contractor's workmanship, and soil conditions. Settlement may cause distress to adjacent structures, if present. To reduce the potential for distress to adjacent structures, we recommend that the shoring system be designed to limit the ground settlement behind the shoring to ½ inch or less. Possible causes of settlement that should be addressed include vibration during installation of the sheet piling, excavation for construction, construction vibrations, dewatering, and removal of the support system. We recommend that the potential settlement distress be evaluated carefully by the contractor prior to construction.

The contractor should retain a qualified and experienced engineer to design the shoring system. The shoring parameters presented in this report are for preliminary design purposes and the contractor should evaluate the adequacy of these parameters and make appropriate modifications for their design. We recommend that the contractor take appropriate measures to protect workers. OSHA requirements pertaining to worker safety should be observed. We further recommend that the construction methods provided herein be carefully evaluated by a qualified specialty contractor prior to commencement of the construction.

DRAFT

10.1.6 Remedial Grading – Fill Slopes

We recommend that the existing fill and colluvium that underlie new fill slopes be overexcavated down to competent formational material. The lateral extents of the overexcavation may be modified in the field based on site constraints. The extent and depths of removals and overexcavations should be evaluated by Ninyo & Moore's representative in the field based on the materials exposed.

The resultant removal surface should be scarified to a depth of approximately 8 inches, moisture conditioned, and recompacted to a relative compaction of 90 percent as evaluated by the ASTM International (ASTM) Test Method D 1557. Once the resulting removal surface has been recompacted, the overexcavation should then be backfilled with onsite or import soils that are compacted to a relative compaction of 90 percent as evaluated by the ASTM D 1557.

10.1.7 Remedial Grading – New Buildings

We recommend that the existing fill and colluvium that underlies the proposed buildings be overexcavated down to competent formational material. This overexcavation should extend a lateral distance of 5 feet beyond the horizontal limits of the foundations. The lateral extents of the overexcavation may be modified in the field based on site constraints. The extent and depths of removals and overexcavations should be evaluated by Ninyo & Moore's representative in the field based on the materials exposed.

The resultant removal surface should be scarified to a depth of approximately 8 inches, moisture conditioned, and recompacted to a relative compaction of 90 percent as evaluated by the ASTM International (ASTM) Test Method D 1557. Once the resulting removal surface has been recompacted, the overexcavation should then be backfilled with onsite or import soils that possess a very low to low potential for expansion that are compacted to a relative compaction of 90 percent as evaluated by the ASTM D 1557.

Several onsite soils possess a medium potential for expansion. These materials are not considered suitable for reuse as compacted fill within building footprints. The contractor should anticipate importing materials for these remedial grading operations.

DRAFT

10.1.8 Remedial Grading – Site and/or Retaining Walls

Where site and/or retaining walls not connected to buildings are planned, we recommend that the existing fill and colluvium that underlies the proposed walls be overexcavated down to competent formational material. This overexcavation should extend a lateral distance of 2 feet beyond the horizontal limits of the foundation. The lateral extents of the overexcavation may be modified in the field based on site constraints. The extent and depths of removals and overexcavations should be evaluated by Ninyo & Moore's representative in the field based on the materials exposed.

Subsequent to performance of the overexcavation removal, the resulting surface should be scarified to a depth of approximately 8 inches, moisture conditioned, and recompacted to a relative compaction of 90 percent as evaluated by the ASTM D 1557 prior to placing new fill. Once the resulting removal surface has been recompacted, the overexcavation should then be backfilled with onsite or import soils that possess a very low to low potential for expansion that are compacted to a relative compaction of 90 percent as evaluated by the ASTM D 1557.

Several onsite soils possess a medium potential for expansion. These materials are not considered suitable for reuse as compacted fill within 2 feet of foundation element bottoms. The contractor should anticipate importing materials for these remedial grading operations.

10.1.9 Remedial Grading – Exterior Concrete Flatwork

If exterior pedestrian concrete flatwork is proposed, we recommend that the onsite subgrade soils be overexcavated to a depth of 1 foot below the planned subgrade elevation. The overexcavation should extend outward horizontally 2 feet from the exterior limits of the hardscaping, where feasible. The extent and depth of removals should be evaluated by Ninyo & Moore's representative in the field based on the material exposed.

The resulting surface should be scarified 8 inches, moisture conditioned, and recompacted to a relative compaction of 90 percent as evaluated by ASTM D 1557. The removals should then be backfilled with onsite or import soils that possess a low to very low potential for expansion (i.e., an EI less than 50). These compacted fill materials should be placed at a relative compaction of 90 percent as evaluated by ASTM D 1557.

Several onsite soils possess a medium potential for expansion. These materials are not considered suitable for reuse as compacted fill within 2 feet below the subgrade elevation for the concrete flatwork. The contractor should anticipate importing materials for these remedial grading operations.

DRAFT

10.1.10 Remedial Grading – Vehicular Pavements

For vehicular pavements, we recommend that the onsite subgrade soils be overexcavated to a depth of 1 foot below the planned subgrade elevation. The overexcavation should extend outward horizontally 2 feet from the exterior limits of the pavements, where feasible. The extent and depth of removals should be evaluated by Ninyo & Moore's representative in the field based on the material exposed. The resulting surface should be scarified 8 inches, moisture conditioned, and recompacted to a relative compaction of 90 percent as evaluated by ASTM D 1557. The removals should then be backfilled with compacted fill soils placed at a relative compaction of 95 percent as evaluated by ASTM D 1557.

10.1.11 Materials for Fill

Onsite soils may be suitable for reuse as engineered fill, provided they are processed in accordance with the following recommendations. Soils derived from onsite excavations are anticipated to generate gravel, cobbles, and similar sized rock fragments and additional processing and handling (i.e., screening and/or rock picking) will be needed prior to reuse as engineered fill. Engineered fill soils should possess an organic content of less than approximately 3 percent by volume (or 1 percent by weight). In general, engineered fill material should not contain rocks or lumps over approximately 3 inches in diameter, and not more than approximately 30 percent larger than ¾ inch. Oversize materials should be

processed down to suitable size or should be separated from material to be used for fill and removed from the site. Fill soils should consist of generally granular soils that possess a USCS classification of SM, SC, SP, SP-SM, SP-SC, SW, SW-SM, or SW-SC according to ASTM D 2487.

Imported fill material, if needed, should generally be granular soils with a very low to low expansion potential (i.e., an EI of 50 or less). Import material should also be non-corrosive in accordance with the Caltrans (2021) corrosion guidelines. Caltrans (2021) defines corrosive soils as having soil materials with a chloride concentration of 500 parts per million (ppm) or greater, a sulfate concentration of 0.15 percent or greater (i.e., 1,500 ppm or greater), a pH value of 5.5 or less, and/or an electrical resistivity of 1,500-ohm centimeters (ohm-cm) or less. Materials for use as fill should be evaluated by Ninyo & Moore's representative prior to filling or importing.

10.1.12 Compacted Fill

DRAFT

Prior to placement of compacted fill, the contractor should request an evaluation of the exposed ground surface by Ninyo & Moore. The exposed ground surface should then be scarified to a depth of approximately 8 inches and watered or dried, as needed, to achieve moisture contents generally at or slightly above the optimum moisture content. The scarified materials should then be compacted to a relative compaction of 90 percent as evaluated in accordance with the ASTM D 1557. The evaluation of compaction by the geotechnical consultant should not be considered to preclude any requirements for observation or approval by governing agencies. It is the contractor's responsibility to notify this office and the appropriate governing agency when project areas are ready for observation, and to provide reasonable time for that review.

Fill materials should be moisture conditioned to generally at or slightly above the laboratory optimum moisture content prior to placement. The optimum moisture content will vary with material type and other factors. Moisture conditioning of fill soils should be generally consistent within the soil mass.

Prior to placement of additional compacted fill material following a delay in the grading operations, the exposed surface of previously compacted fill should be prepared to receive fill. Preparation may include scarification, moisture conditioning, and recompaction.

Compacted fill should be placed in horizontal lifts of approximately 8 inches in loose thickness. Prior to compaction, each lift should be watered or dried as needed to achieve a moisture content generally at or slightly above the laboratory optimum, mixed, and then

compacted by mechanical methods to a relative compaction of 90 percent as evaluated by ASTM D 1557. The upper 12 inches of the subgrade materials beneath vehicular pavements should be compacted to a relative compaction of 95 percent relative density as evaluated by ASTM D 1557. Also, in areas where 20 feet of fill or more is anticipated, each lift should be compacted to a relative compaction of 95 percent relative density as evaluated by ASTM D 1557 at depths greater than 20 feet. Successive lifts should be treated in a like manner until the desired finished grades are achieved.

10.1.13 Fill Slopes

We anticipate that new fill slopes will be constructed for the project. Unless otherwise recommended by our offices and approved by the regulating agencies, new permanent cut slopes in the Santa Barbara Formation should not be steeper than 1:1 (horizontal to vertical) and engineered fill slopes should not be steeper than 2:1 (horizontal to vertical).

When placing fill on slopes steeper than 5:1, existing fill, topsoil, slope wash, colluvium, and other materials deemed unsuitable shall be removed. Near-horizontal keys and near-vertical benches shall be excavated into sound formational material or firm, competent fill material. Keying and benching shall be accomplished in general accordance with the recommendations in the CBC Appendix J107.3. Compacted fill should not be placed in an area subsequent to keying and benching until the area has been observed by the geotechnical consultant. Where the natural gradient of a slope is less than 5:1, benching is generally not recommended. However, fill should not be placed on compressible or otherwise unsuitable materials left on the slope face.

DRAFT

Compaction of the face of temporary and permanent fill slopes should be performed by backrolling at intervals of 4 feet or less in vertical height, or as dictated by the capability of the available equipment, whichever is less. Fill slopes should be backrolled utilizing a conventional sheepsfoot-type roller. Care should be taken to maintain the desired moisture conditions and/or reestablish them, as needed, prior to backrolling. Fill slopes should be overbuilt and cut back to finish grades. The placement, moisture-conditioning, and compaction of fill slope materials should be done in accordance with the recommendations presented in the Compacted Fill section of this report.

The onsite soils are susceptible to erosion. The project plans and specifications should contain design features and construction requirements to mitigate erosion of soils or contain a maintenance program to redress erosion features as they develop on a periodic basis. Slopes and other exposed ground surfaces should be appropriately planted with a protective ground cover. To enhance surficial stability, fill slopes should be planted as soon as feasible

subsequent to grading. Erosion control and drainage devices should be installed in compliance with the requirements of the local governing agencies as soon as feasible subsequent to grading.

Site runoff should not be permitted to flow over the tops of slopes. Positive drainage should be established away from the top of slopes. This may be accomplished by utilizing brow ditches placed at the top of slopes to divert surface runoff away from the slope face where drainage devices are not otherwise available.

10.1.14 Fill Placement on Sloping Ground

Fills constructed on sloping ground having an inclination steeper than 5:1 should be keyed and benched into competent materials underlying loose soils. When placing fill on slopes steeper than 5:1, topsoil, slope wash, colluvium, and other materials deemed unsuitable shall be removed. Keys should generally be 15 feet in width or greater and extend 3 feet or more into the competent material. The actual width of the keys and extent of removal of any existing loose surficial soil or other native materials should be evaluated by Ninyo & Moore or the client's designated representative in the field during construction. In addition, key excavations should be observed by Ninyo & Moore or the client's designated representative prior to placing fill.

DRAFT

10.1.15 Pipe Bedding and Modulus of Soil Reaction (E')

We recommend that new pipelines (pipes), where constructed in open excavations, be supported on 6 or more inches of granular bedding material. Granular pipe bedding should be provided to distribute vertical loads around the pipe. Bedding material and compaction requirements should be in accordance with this report. Pipe bedding typically consists of graded aggregate with a coefficient of uniformity of three or more.

The modulus of soil reaction (E') is used to characterize the stiffness of soil backfill placed at the sides of buried flexible pipes for the purpose of evaluating deflection caused by the weight of the backfill over the pipe (Hartley and Duncan, 1987). For pipelines constructed in granular fill soils we recommend that a modulus of soil reaction of 1,400 pounds per square inch (psi) be used for design for 0 to 5 feet deep excavations and 2,000 psi for excavations exceeding 5 feet depth, provided that granular bedding material is placed adjacent to the pipe, as recommended in this report.

10.1.16 Lateral Pressures for Thrust Blocks

Thrust restraint for buried pipelines may be achieved by transferring the thrust force to the soil outside the pipe through a thrust block. Thrust blocks may be designed using the lateral passive earth pressures presented on Figure 11. Thrust blocks should be backfilled with granular backfill material and compacted in accordance with recommendations presented in this report.

10.1.17 Drainage

Roof, pad, and slope drainage should be conveyed such that runoff water is diverted away from slopes and structures to suitable discharge areas by nonerodible devices (e.g., gutters, downspouts, concrete swales, etc.). Positive drainage adjacent to structures should be established and maintained. Positive drainage may be accomplished by providing drainage away from the foundations of the structure at a gradient of 2 percent or steeper for a distance of 5 feet or more outside building perimeters, and further maintained by a graded swale leading to an appropriate outlet, in accordance with the recommendations of the project civil engineer and/or landscape architect.

DRAFT

Surface drainage on the site should be provided so that water is not permitted to pond. A gradient of 2 percent or steeper should be maintained over the pad area and drainage patterns should be established to divert and remove water from the site to appropriate outlets.

Care should be taken by the contractor during grading to preserve any berms, drainage terraces, interceptor swales or other drainage devices of a permanent nature on or adjacent to the property. Drainage patterns established at the time of grading should be maintained for the life of the project. The property owner and the maintenance personnel should be made aware that altering drainage patterns might be detrimental to foundation performance.

10.2 Seismic Design Parameters

Design of the proposed improvements should be performed in accordance with the requirements of governing jurisdictions and applicable building codes. Table 4 presents the seismic design parameters for the site, consistent with ASCE 7-22.

Table 4 – ASCE 7-22 Seismic Design Criteria	
Spectral Response Acceleration Parameters	**Values**
Seismic Site Class	CD
MCE_R Spectral Response Acceleration at 0.2-Second Period for Site Class BC, S_s	2.56g
MCE_R Spectral Response Acceleration at 1.0-Second Period for Site Class BC, S_1	0.94g
MCE_R Spectral Response Acceleration at Short Periods Adjusted for Site Class, S_{MS}	2.59g
MCE_R Spectral Response Acceleration at 1.0-Second Period Adjusted for Site Class, S_{M1}	1.76g
Design Spectral Response Acceleration at Short Periods, S_{DS}	1.73g
Design Spectral Response Acceleration at 1.0-Second Period, S_{D1}	0.18g
Maximum Considered Earthquake Geometric Mean (MCE_G) Peak Ground Acceleration, PGA_M	1.05g

10.3 Foundations

Based on our understanding that the project, we anticipate that the new reservoir tanks will be founded on a continuous perimeter wall foundation and isolated internal column spread footings that bear on compacted crushed aggregate base materials overlying competent materials of the Santa Barbara Formation. Foundations should be designed in accordance with structural considerations and the following recommendations. In addition, requirements of the appropriate governing jurisdictions and applicable building codes should be considered in the design of the structures.

DRAFT

10.3.1 Continuous Perimeter Wall (Shallow) Foundations - Bearing Capacity

A continuous perimeter wall type foundation system and isolated internal column spread footings bearing on compacted crushed aggregate base materials can be designed for a net allowable bearing pressure of 3,000 pounds per square foot (psf). This allowable bearing capacity may be increased by one-third when considering loads of a short duration such as wind or seismic forces. Perimeter wall footings should be founded 24 inches below the lowest adjacent grade and should have a width of 24 inches. An additional 500 psf may be added to the bearing capacity for each additional foot of width or depth up to 4,500 psf. Footings should be reinforced in accordance with the recommendations of the project structural engineer.

10.3.2 Continuous Perimeter Wall (Shallow) Foundations - Lateral Resistance

For resistance of footings to lateral loads, we recommend an allowable passive pressure of 300 psf per foot of depth be used with a value of up to 3,000 psf. This value assumes that the ground is horizontal for a distance of 10 feet, or three multiplied by the height generating the passive pressure, whichever is more. We recommend that the upper 1 foot of soil not protected by pavement or a concrete slab be neglected when calculating passive resistance.

For frictional resistance to lateral loads, we recommend a coefficient of friction of 0.3 be used between soil and concrete. The allowable lateral resistance can be taken as the sum of the frictional resistance and passive resistance provided the passive resistance does not exceed one-half of the total allowable resistance. The passive resistance values may be increased by one-third when considering loads of short duration such as wind or seismic forces.

10.3.3 Static Settlement

We estimate that the proposed reservoir, designed and constructed as recommended herein, will undergo total settlement on the order of ½ inch. Differential settlement on the order of ¼ inch over a horizontal span of 50 feet should be expected.

10.4 Retaining Walls

For the design of a yielding retaining wall that is not restrained against movement by rigid corners or structural connections, the design lateral earth pressures are presented on Figure 12. Restrained walls (non-yielding) may be designed for the lateral earth pressures presented on Figure 13. These pressures assume low-expansive backfill and free draining conditions. Measures should be taken to reduce the potential for build-up of moisture behind the retaining walls. A drain should be provided behind the retaining wall as shown on Figure 14. The drain should be connected to an appropriate outlet.

DRAFT

10.5 Solar Structures

While specific details have not yet been provided, we understand that solar structures are planned to be constructed on the reservoir embankments. Th proposed solar structures may be supported on shallow spread footings or on cast-in-drilled-hole (CIDH) concrete pile foundations. Geotechnical recommendations for foundation options are provided below.

10.5.1 CIDH Foundations

Canopy mounted solar arrays typically impose relatively light axial loads on foundations. The pile dimensions (i.e., diameter and embedment) should be evaluated by the project structural engineer.

The drilled pile construction should be observed by Ninyo & Moore during drilling to evaluate if the piles have been extended to the design depths. The drilled holes should be cleaned of loose soil, gravel, and cobble. It is the contractor's responsibility to (a) take appropriate measures for maintaining the integrity of the drilled holes, (b) see that the holes are cleaned and straight, and (c) see that sloughed loose soil is removed from the bottom of the hole prior to the placement of

concrete. Drilled piles should be checked for alignment and plumbness during installation. The amount of acceptable misalignment of a pile is approximately 3 inches from the plan location. It is usually acceptable for a pile to be out of plumb by 1 percent of the depth of the pile. The center-to-center spacing of piles should be no less than three times the nominal diameter of the pile.

For resistance of solar structure footings to lateral loads, we recommend an allowable passive pressure of 600 psf per foot of depth be used with a value of up to 6,000 psf. This value has already been doubled based on the assumption that the structures are designed to tolerate ½ inch of deflection at the surface and that the ground is horizontal for a distance of 10 feet, or three times the height generating the passive pressure, whichever is greater. We recommend that the upper 1 foot of soil not protected by pavement or a concrete slab be neglected when calculating passive resistance. For frictional resistance to lateral loads, we recommend a coefficient of friction of 0.3 be used between soil and concrete. The passive resistance values may be increased by one-third when considering loads of short duration such as wind or seismic forces.

DRAFT

10.5.2 Shallow Foundations

If preferred, spread footings for solar structures should be embedded to depths of 18 inches or more. Foundations should be designed in accordance with structural considerations and the following recommendations. In addition, requirements of the appropriate governing jurisdictions and applicable building codes should be considered in the design of the structures. Shallow, spread footings for fencing and light pole structures bearing on compacted fill may be designed using an allowable bearing capacity of 2,500 psf. These allowable bearing capacities may be increased by one-third when considering loads of short duration such as wind or seismic forces. Spread footings should be 24 inches or more in width. The footings should be reinforced in accordance with the recommendations of the project structural engineer.

For resistance of spread footings to lateral loads, we recommend an allowable passive pressure of 300 psf per foot of depth be used with a value of up to 3,000 psf. This value assumes that the ground is horizontal for a distance of 10 feet, or three times the height generating the passive pressure, whichever is more. We recommend that the upper 1 foot of soil not protected by pavement or a concrete slab be neglected when calculating passive resistance.

For frictional resistance to lateral loads, we recommend a coefficient of friction of 0.3 be used between soil and concrete. The passive resistance values may be increased by one-third when considering loads of short duration such as wind or seismic forces.

10.6 Fencing and Light Poles

Fencing and/or light poles may be supported on shallow spread footings or on cast-in-drilled-hole (CIDH) concrete pile foundations. Geotechnical recommendations for foundation options are provided below.

10.6.1 CIDH Foundations

Fencing and light poles typically impose relatively light axial loads on foundations. The pile dimensions (i.e., diameter and embedment) should be evaluated by the project structural engineer.

The drilled pile construction should be observed by Ninyo & Moore during drilling to evaluate if the piles have been extended to the design depths. The drilled holes should be cleaned of loose soil, gravel, and cobble. It is the contractor's responsibility to (a) take appropriate measures for maintaining the integrity of the drilled holes, (b) see that the holes are cleaned and straight, and (c) see that sloughed loose soil is removed from the bottom of the hole prior to the placement of concrete. Drilled piles should be checked for alignment and plumbness during installation. The amount of acceptable misalignment of a pile is approximately 3 inches from the plan location. It is usually acceptable for a pile to be out of plumb by 1 percent of the depth of the pile. The center-to-center spacing of piles should be no less than three times the nominal diameter of the pile.

DRAFT

For resistance of fencing and/or light pole footings to lateral loads, we recommend an allowable passive pressure of 600 psf per foot of depth be used with a value of up to 6,000 psf. This value has already been doubled based on the assumption that the structures are designed to tolerate ½ inch of deflection at the surface and that the ground is horizontal for a distance of 10 feet, or three times the height generating the passive pressure, whichever is greater. We recommend that the upper 1 foot of soil not protected by pavement or a concrete slab be neglected when calculating passive resistance. For frictional resistance to lateral loads, we recommend a coefficient of friction of 0.3 be used between soil and concrete. The passive resistance values may be increased by one-third when considering loads of short duration such as wind or seismic forces.

10.6.2 Shallow Foundations

If preferred, spread footings for fencing and light pole structures should be embedded to depths of 18 inches or more. Foundations should be designed in accordance with structural considerations and the following recommendations. In addition, requirements of the appropriate governing jurisdictions and applicable building codes should be considered in the design of the structures. Shallow, spread footings for fencing and light pole structures bearing on compacted fill may be designed using an allowable bearing capacity of 2,500 psf. These allowable bearing capacities may be increased by one-third when considering loads of short duration such as wind or seismic forces. Spread footings should be 24 inches or more in width. The footings should be reinforced in accordance with the recommendations of the project structural engineer.

For resistance of spread footings to lateral loads, we recommend an allowable passive pressure of 300 psf per foot of depth be used with a value of up to 3,000 psf. This value assumes that the ground is horizontal for a distance of 10 feet, or three times the height generating the passive pressure, whichever is more. We recommend that the upper 1 foot of soil not protected by pavement or a concrete slab be neglected when calculating passive resistance.

DRAFT

For frictional resistance to lateral loads, we recommend a coefficient of friction of 0.3 be used between soil and concrete. The passive resistance values may be increased by one-third when considering loads of short duration such as wind or seismic forces.

10.7 Underground Structures

Underground structures may be designed for lateral pressures represented by the pressure diagram on Figure 15. It is recommended that the exterior of underground walls and horizontal and vertical construction joints be waterproofed, as indicated by the project civil engineer and/or architect. For pipe wall penetrations into a lift station, vaults, and other structures, standard “water-tight” penetration design should be utilized. To reduce the potential for relative pipe to wall differential settlement, which could cause pipe shearing, we recommend that a pipe joint be located close to the exterior of the wall. The type of joint should be such that minor relative movement can be accommodated without distress.

10.8 Concrete Flatwork

We recommend that exterior concrete flatwork should be 4 inches in thickness and should be reinforced with No. 3 reinforcing bars placed at 24 inches on-center both ways. No vapor retarder is needed for exterior flatwork. To reduce the potential manifestation of distress to exterior concrete flatwork due to movement of the underlying soil, we recommend that such

flatwork be installed with crack-control joints at appropriate spacing as designed by the structural or civil engineer. The subgrade soils should be scarified to a depth of 8 inches, moisture conditioned to generally at or slightly above the laboratory optimum moisture content, and compacted to a relative compaction of 90 percent as evaluated by ASTM D 1557. Positive drainage should be established and maintained adjacent to flatwork.

10.9 Preliminary Flexible Pavement Design

Our laboratory testing on representative samples of the near-surface soils at the site indicated that the clayey materials onsite possessed R-values ranging from 8 to 21. Accordingly, we have used a design R-value of 8 and Traffic Indices (TI) of 5, 6, and 7 for the basis of our preliminary design of flexible pavements for the project. However, actual pavement recommendations should be based on R-value tests performed on bulk samples of the soils exposed at the finished subgrade elevations following grading operations. We recommend that the geotechnical consultant re-evaluate the pavement design at the time of construction.

DRAFT

The recommended preliminary flexible pavement sections for onsite areas are presented in the Table 5 below.

Table 5 – Recommended Preliminary Flexible Pavement Sections

Traffic Index	Design R-Value	Asphalt Concrete Thickness (inches)	Aggregate Base Thickness (inches)
5	8	3	9
6	8	4	12
7	8	4	16

As indicated, these values assume TIs of 7.0 or less for site pavements. If traffic loads are different from those assumed, the pavement design should be re-evaluated. We recommend that the upper 12 inches of the subgrade be compacted to a relative compaction of 95 percent relative density as evaluated by the current version of ASTM D 1557. Additionally, aggregate base materials should be compacted to a relative compaction of 95 percent relative density as evaluated by the current version of ASTM D 1557. AC materials should be compacted to 95 percent of the Hveem density as evaluated by the California Test (CT) 366.

10.10 Soil Corrosivity

Laboratory testing was performed on a representative sample of near-surface soil to evaluate soil pH, electrical resistivity, water-soluble chloride content, and water-soluble sulfate content. The soil pH and electrical resistivity tests were performed in general accordance with California Test

Method (CT) 643. The chloride content test was performed in general accordance with CT 422. Sulfate testing was performed in general accordance with CT 417.

The results of the corrosivity testing indicated electrical resistivities ranging from 720 to 3,000 ohm-cm, soil pH of 7.9 and 8.2, chloride contents ranging from 130 to 435 ppm, and sulfate contents ranging from 0.004 to 0.054 percent (i.e., 40 to 540 ppm). Based on a comparison with the California amended (Caltrans, 2021) corrosion criteria, the onsite soils would be classified as corrosive. Corrosive soils are defined as soil with an electrical resistivity of 1,500 ohm-cm or less, a chloride content of 500 ppm or greater, a sulfate content of 0.15 percent (1,500 ppm) or greater, and/or a pH equal to or less than 5.5.

10.11 Concrete

Concrete in contact with soil or water that contains high concentrations of water-soluble sulfates that can be subject to premature chemical and/or physical deterioration. As noted, the soil samples tested in this evaluation indicated water-soluble sulfate contents ranging from 0.004 to 0.054 percent by weight (i.e., 40 to 540 ppm). Based on the American Concrete Institute (ACI) 318 criteria, the site soils would correspond to exposure class S0. For this exposure class, ACI 318 recommends that normal weight concrete in contact with soil possess a compressive strength of 2,500 pounds per square inch (psi) or more. Furthermore, due to the potential for variability of site soils, we also recommend that normal weight concrete in contact with soil use Type II, II/V, or V cement.

DRAFT

11 PRE-CONSTRUCTION CONFERENCE

We recommend that a pre-construction meeting be held prior to commencement of grading. The owner or his representative, the inspector, the agency representatives, the civil engineer, Ninyo & Moore, and the contractor should attend to discuss the plans, the project, and the proposed construction schedule.

12 PLAN REVIEW AND CONSTRUCTION OBSERVATION

The conclusions and recommendations presented in this report are based on analysis of observed conditions in widely spaced exploratory borings. If conditions are found to vary from those described in this report, Ninyo & Moore should be notified, and additional recommendations will be provided upon request. Ninyo & Moore should review the final project drawings and specifications prior to the commencement of construction. Ninyo & Moore should perform the needed observation and testing services during construction operations.

The recommendations provided in this report are based on the assumption that Ninyo & Moore will provide geotechnical observation and testing services during construction. In the event that it is decided not to utilize the services of Ninyo & Moore during construction, we request that the selected consultant provide the client and Ninyo & Moore with a letter indicating that they fully understand Ninyo & Moore's recommendations, and that they are in full agreement with the design parameters and recommendations contained in this report. Construction of proposed improvements should be performed by qualified subcontractors utilizing appropriate techniques and construction materials.

13 LIMITATIONS

The field evaluation, laboratory testing, and geotechnical analyses presented in this geotechnical report have been conducted in general accordance with current practice and the standard of care exercised by geotechnical consultants performing similar tasks in the project area. No warranty, expressed or implied, is made regarding the conclusions, recommendations, and opinions presented in this report. There is no evaluation detailed enough to reveal every subsurface condition. Variations may exist and conditions not observed or described in this report may be encountered during construction. Uncertainties relative to subsurface conditions can be reduced through additional subsurface exploration. Additional subsurface evaluation will be performed upon request. Please also note that our evaluation was limited to assessment of the geotechnical aspects of the project, and did not include evaluation of structural issues, environmental concerns, or the presence of hazardous materials.

DRAFT

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires additional information or has questions regarding the content, interpretations presented, or completeness of this document.

This report is intended for design purposes only. It does not provide sufficient data to prepare an accurate bid by contractors. It is suggested that the bidders and their geotechnical consultant perform an independent evaluation of the subsurface conditions in the project areas. The independent evaluations may include, but not be limited to, review of other geotechnical reports prepared for the adjacent areas, site reconnaissance, and additional exploration and laboratory testing.

Our conclusions, recommendations, and opinions are based on an analysis of the observed site conditions. If geotechnical conditions different from those described in this report are encountered, our office should be notified and additional recommendations, if warranted, will be provided upon

request. It should be understood that the conditions of a site could change with time as a result of natural processes or the activities of man at the subject site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control.

This report is intended exclusively for use by the client. Any use or reuse of the findings, conclusions, and/or recommendations of this report by parties other than the client is undertaken at said parties' sole risk.

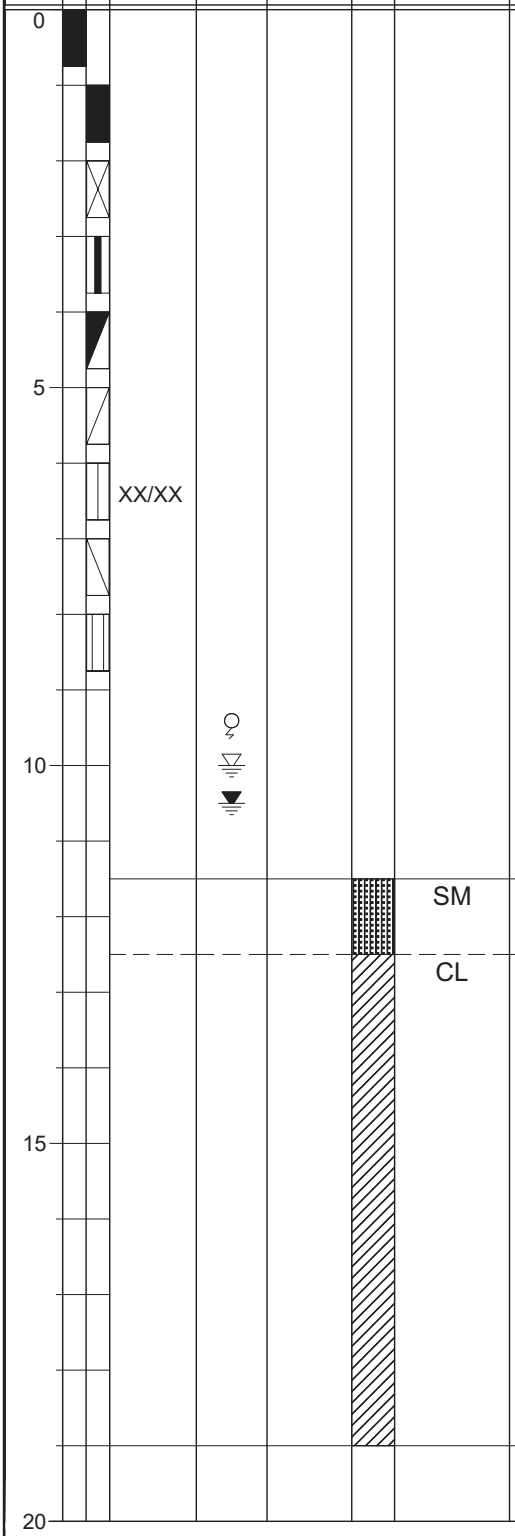
Boring and Test Pit Logs

BORING LOG EXPLANATION SHEET



Bulk sample.

Modified split-barrel drive sampler.

No recovery with modified split-barrel drive sampler.

Sample retained by others.

Standard Penetration Test (SPT).

No recovery with a SPT.

Shelby tube sample. Distance pushed in inches/length of sample recovered in inches.

No recovery with Shelby tube sampler.

Continuous Push Sample.

DRAFT

Seepage.

Groundwater encountered during drilling.

Groundwater measured after drilling.

SM

MAJOR MATERIAL TYPE (SOIL):
Solid line denotes unit change.

CL

Dashed line denotes material change.

Attitudes: Strike/Dip
b: Bedding
c: Contact
j: Joint
f: Fracture
F: Fault
cs: Clay Seam
s: Shear
bss: Basal Slide Surface
sf: Shear Fracture
sz: Shear Zone
sbs: Shear Bedding Surface

The total depth line is a solid line that is drawn at the bottom of the boring.

USCS METHOD OF SOIL CLASSIFICATION

APPENDIX A

BORING AND TEST PIT LOGS

Field Procedure for the Collection of Disturbed Samples
Disturbed soil samples were obtained in the field using the following method.

Bulk Samples
Bulk samples of representative earth materials were obtained from the exploratory borings and test pits. The samples were bagged and transported to the laboratory for testing.

Field Procedure for the Collection of Relatively Undisturbed Samples
Relatively undisturbed soil samples were obtained in the field from the borings using the following method.

The Modified Split-Barrel Drive Sampler
The sampler, with an external diameter of 3 inches, was lined with 1-inch long, thin brass rings with inside diameters of approximately 2.4 inches. The sample barrel was driven into the ground with the weight of a hammer in general accordance with ASTM D 3550. The driving weight was permitted to fall freely. The approximate length of the fall, the weight of the hammer, and the number of blows per foot of driving are presented on the boring logs as an index to the relative resistance of the materials sampled. The samples were removed from the sample barrel in the brass rings, sealed, and transported to the laboratory for testing.

Notes:

t_1 = initial time when filling or refilling is completed

d_1 = initial depth to water in hole at t_1

t_2 = final time when incremental water level reading is taken

d_2 = final depth to water in hole at t_2

Δt = change in time between initial and final water level readings

ΔH = change in depth to water or change in height of water column (i.e., $d_2 - d_1$)

in/hr = inches per hour

AF=Adjustment Factor = 2.37

Percolation Rate to Infiltration Rate Conversion [1]

$$I_t = \frac{\Delta H \times 60 \times r}{\Delta t(r + 2H_{avg})AF}$$

I_t = tested infiltration rate, inches/hour

ΔH = change in head over the time interval, inches

Δt = time interval, minutes

r = effective radius of test hole

H_{avg} = average head over the time interval, inches

APPENDIX D

Geotechnical Laboratory Testing

DRAFT

APPENDIX D

GEOTECHNICAL LABORATORY TESTING

Classification
Soils were visually and texturally classified in accordance with the Unified Soil Classification System (USCS) in general accordance with ASTM D 2488. Soil classifications are indicated on the log of the exploratory borings and test pits in Appendix A.

Gradation Analysis
Gradation analysis tests were performed on selected representative soil samples in general accordance with ASTM D 422. The grain size distribution curves are shown on Figures D-1 through D-11. The test results were utilized in evaluating the soil classification in accordance with the USCS.

Consolidation Tests
Consolidation tests were performed on selected relatively undisturbed soil samples in general accordance with ASTM D 2435. The samples were inundated during testing to represent adverse field conditions. The percent of consolidation for each load cycle was recorded as a ratio of the amount of vertical compression to the original height of the sample. The results of the tests are summarized on Figures D-12 and D-13.

DRAFT

Direct Shear Tests
Direct shear tests were performed on relatively undisturbed soil samples in general accordance with ASTM D 3080 to evaluate the shear strength characteristics of the selected material. The samples were inundated during shearing to represent adverse field conditions. The results are shown on Figures D-14 through D-24.

Expansion Index Tests
The expansion indices of selected materials were evaluated in general accordance with ASTM D 4829. The specimens were molded under a specified compactive energy at approximately 50 percent saturation. The prepared 1-inch thick by 4-inch diameter specimens were loaded with a surcharge of 144 pounds per square foot and was inundated with tap water. Readings of volumetric swell were made for a period of 24 hours. The results of this test are presented on Figure D-25.

Soil Corrosivity Tests
Soil pH and electrical resistivity tests were performed on representative samples in general accordance with CT 643. The sulfate and chloride contents of the selected samples were evaluated in general accordance with CT 417 and 422, respectively. The results of these tests are presented on Figure D-26.

R-Value
The resistance value, or R-value, for site soils was evaluated in general accordance with California Test (CT) 301. Samples were prepared and evaluated for exudation pressure and expansion pressure. The equilibrium R-value is reported as the lesser or more conservative of the two calculated results. The test results are shown on Figure D-27.

DRAFT

	Yes	No*	N/A	Note or Comment
1. Are the COCs Correct?	✔			
2. Are Sample labels legible & indelible ink?	✔			
3. Do samples match the COC?	✔			
4. Are the required analyses clear?	✔			
5. Is there enough samples for required analysis?	✔			
6. Does cooler or samples have custody seal(s)?			✔	
7. Are sample containers intact and in good condition?	✔			
8. Are samples preserved?	✔			
9. Are samples preserved properly for the intended analysis?	✔			
10. Are the VOAs free of headspace? See footnote.			✔	
11. Are the jars free of headspace?			✔	
12. Are there any samples with short hold times?		✔		

* = see note below. N/A = Not Applicable

PLEASE NOTE ALL SAMPLES WILL BE DISPOSED OF 30 DAYS AFTER RECEIVING DATE. IF AETL IS INFORMED OTHERWISE, THERE WILL BE A STORAGE CHARGE PER SAMPLE PER MONTH FOR ANY SAMPLE HELD BEYOND 30 DAYS.

◯ Example maximum headspace bubble size; acceptance criteria not to exceed 5-6 mm in diameter.

For headspace bubbles exceeding 6 mm in diameter, sample receiving will tag the VOA and notify the Project Manager (PM). The PM will contact the client for Analyze or Resample instructions.

* For samples generating a "No" answer, the Project Manager is notified, and the PM will contact the client for Analyze or Resample instructions.

Case Narrative

The following "Sample Received" Section summarizes the samples received and associated analyses requested as specified on the enclosed chain of custody.

Results as reported by the laboratory apply only to 1) the items tested, 2) as the samples are received, and 3) the accuracy of information provided. Information supplied by the customer that may affect validity of results and may be contained in this report include Project Name/Number, Site Location, Sample Locations, Sampling Dates/Times, Sample ID, Sample Preservation, Sample Matrix, Sample Properties, Field Blanks, Field Duplicates, Field Spikes, and Site Historical Data.

DRAFT

Accreditation applies only to the test methods listed on each scope of accreditation held by the laboratory; certifications held by the laboratory may not apply to results supplied in this report.

Unless otherwise noted, all results of soil and solid samples are based on wet weight.

No analytical non-conformances were encountered.

The contents of this report apply to the sample(s) analyzed in accordance with the chain of custody document.
No duplication of this report is allowed, except in its entirety without written approval of the laboratory.

Hazards and Hazardous Materials Documentation

Rincon Consultants, Inc.
315 East Carrillo Street, Suite 105
Santa Barbara, California 93101

July 26, 2023
Project No.: 22-12664

Tom Rejzek
Santa Barbara County Public Health Department
Environmental Health Services Division
2125 South Centerpointe Parkway, Suite 333
Santa Maria, California 93455

Subject: Environmental Site Investigation Work Plan for the Vic Trace Reservoir Replacement Project, 740 Dolores Drive, Santa Barbara, California 93109

Dear Mr. Rejzek:

On behalf of the City of Santa Barbara, Rincon Consultants, Inc. (Rincon) has prepared this Environmental Site Investigation Work Plan (Work Plan) to assess on-site soil for potential oil-impacts and hazardous materials, including lead paint, at the Vic Trace Reservoir property located in Santa Barbara, California (Site; Figure 1).

The general purpose of the investigation is to identify the location of an on-site, plugged oil well and associated features (well cap, well cellar and drilling sump) and assess the presence or absence of "sump material," assess shallow soil along the perimeter of the existing reservoir structure for potential lead soil impacts, and conduct a hazardous building materials survey of the reservoir structure.

Introduction and Background

The Vic Trace Reservoir is a 10-million-gallon reservoir constructed in 1956 and consists of a partially buried rectangular concrete tank. As the City's largest reservoir, the Vic Trace Reservoir was recommended to be replaced due to its aging tank structure and to optimize water system hydraulics and operations. The Vic Trace Reservoir Replacement Project (Project) will replace the existing 10-million-gallon drinking water storage tank with possibly two 5-million-gallon buried concrete tanks. The Project is currently in its initial planning and concept phase.

The site is located within the boundaries of the abandoned Mesa Oil Field. The Mesa Oil Field, discovered in 1929, was developed and quickly declined due to limited oil accumulation. In 1935 and prior to the construction of the Vic Trace Reservoir, the Beckstead 1 oil well was drilled within the site boundaries. The operator of the well was the Dralock Oil Company and the American Petroleum Institute well identification number for the well is 0408303644 (California Department of Conservation 2023). Oil well records obtained online from California Department of Conservation Geologic Energy Management Division indicate the well was drilled in August – September 1935 to a total depth of 1,578 feet below grade. Based on the review of the available records, no oil or gas "showings" were encountered, and the well was abandoned on September 14, 1935. The "dry hole" was filled with heavy mud from total depth to 134 feet. After a wooden plug was driven to a depth of 136 feet, cement was added, and the top of the cement was measured at a depth of 75 feet below grade (Attachment 1).

Site Description

Topography

The current USGS topographic map (Santa Barbara 2018) indicates the elevation at the site ranges between approximately 400 and 460 feet above mean sea level (MSL).

Geology and Hydrogeology

The site is located within the Transverse Ranges of southern California, identified by east-west trending mountain ranges and valleys. The Transverse Ranges are comprised of rocks that are progressively older from west to east.

The Geologic Map of the Santa Barbara Quadrangle (Dibblee 1986) indicates the site is underlain by Quaternary-age sediments. The geologic formations that have been mapped in the vicinity of the site include the Santa Barbara Formation (Qsb), the Monterey Formation (Tml), and the Rincon Formation (Tr). The Santa Barbara Formation in the vicinity of the site is of shallow marine origin, dating from the early Pleistocene and possibly the late Pliocene (Dibblee 1986). The Monterey Formation in the vicinity is of marine origin, dating from early to late Miocene. The Rincon Formation is also of marine origin, dating from the early Miocene (Dibblee 1986), and is generally characterized as a poorly bedded, gray clay shale or claystone that weathers to a clayey soil.

The site is located approximately 0.40 mile south of any mapped groundwater basins (California Department of Water Resources).

During the preparation of this Work Plan, Rincon reviewed the California State Water Resource Control Board's online GeoTracker database to evaluate the depth to groundwater in the vicinity of the site. According to data collected at the Elings Park Closed Landfill, located approximately 1.5 miles east-northeast of the site, groundwater was encountered between 8 and 170 feet below ground surface (bgs). The depth to groundwater in the area varies depending on the surface topography. Surface elevations at the Elings Park Closed Landfill range from approximately 70 to 400 feet above MSL (California State Water Resources Control Board).

Rincon also reviewed the case closure summary for the Former JR's Gas located at 1905 Cliff Drive, located approximately 0.5 mile south-southeast of the site. Depth to groundwater ranged from 28 to 32 feet bgs and the groundwater gradient was reported to the north in 2019. The elevation at the Former JR's Gas property is approximately 200 feet above MSL (California State Water Resources Control Board).

Task 1 Previously Conducted Studies

Rincon reviewed historical aerial photographs (at least one photograph for every decade) dating from 1928 through 2020 compiled by Environmental Data Resources (Attachment 2). Based on Rincon's experience identifying historical oil wells and drilling sump features in historical aerial photographs, the sump features associated with the Dralock Oil Company's Beckstead 1 oil well appear to be visible in the 1938, 1943, 1947, and 1954 photographs. These historical aerial photographs pre-date the construction of the Vic Trace Reservoir in 1956.

Rincon georeferenced the historical aerial photographs using consistent geographic landmarks including trees, geologic features, streams, and roads, thus connecting the photographs to their likely position in the real world. After georeferencing was complete, the sump features observed in the 1938, 1943, 1947, and 1954 aerial photographs were outlined and digitized into GIS data. An overlay of the digitized features (by year) was compiled into a single figure which indicates the potential and

approximate location of the sump features on a current aerial photograph (Figure 2). The differences in the location and shape of the digitized features is likely due to drift in the flight lines during the different years, quality of the aerial photograph, and the changes of the features over time.

Based on Rincon's review of historical aerial photographs and georeferencing the site features, the plugged oil well and associated sump features appear to be located beneath the Vic Trace Reservoir.

Task 2 Site Investigation

Objectives

The specific objectives of the site investigation are as follows:

- Assess the presence or absence of a historical drilling sump and potentially oil-impacted material within the sump;
- Delineate lateral and vertical extent of historical drilling sump;
- Characterize drilling sump material for appropriate removal and disposal during reservoir replacement activities, if warranted;
- Assess shallow soil in the vicinity of the reservoir structure for lead impacts associated with lead-based paint (LBP);
- Characterize lead-impacted soil for appropriate soil management during reservoir replacement activities, if warranted;
- Conduct hazardous building materials survey and testing to identify the presence of asbestos-containing materials (ACM) and LBP; and
- Characterize building materials for appropriate management, or remediation, as part of reservoir demolition activities.

The site investigation objectives will be addressed through the work scope described below.

Task 2.1 Pre-field Activities

The following pre-field activities will be conducted:

- **Site Health and Safety Plan.** A site-specific health and safety plan (HASP) that outlines the measures to be followed to minimize potential chemical exposure and other hazards to on-site workers and the public. The HASP is prepared in accordance with Occupational Safety and Health Administration requirements (California Code of Regulations Title 8 Section 5192) and contains safety provisions for routine response activities and unexpected emergencies. The plan contains information on chemical and physical hazards, personal protective equipment, decontamination procedures, personnel responsibilities, and emergency response protocols. This document is required by federal law.
- **Permitting.** A City of Santa Barbara Public Works soil boring permit will be required before the commencement of any subsurface activities. A Santa Barbara County Public Health Department, Environmental Health Services Division (EHS) permit will not be needed based on the depth to groundwater in the vicinity of the site (greater than 230 feet).
- **Underground Service Alert (USA) Marking and Notification.** Prior to advancing soil borings, Rincon will pre-mark the proposed locations with white paint and notify USA utility marking service. California law requires this notification. The utility marking service identifies known utility locations in the public right-of-way. In addition, prior to performing subsurface activities, Rincon will ask the

City if they know of any subsurface utilities that may conflict with the proposed boring locations. If we are informed of utilities in proposed boring locations, Rincon will adjust the location to avoid the subsurface utilities.

Task 2.2 Subsurface Soil Assessment

As stated previously, based on Rincon's review of historical aerial photographs and georeferencing the site features, the plugged oil well and associated sump features appear to be located beneath the Vic Trace Reservoir. Historic drilling sumps were generally 10 to 20 feet deep, however based on the excavation and grading that occurred when the reservoir was constructed, it is likely the drilling sump would be no greater than 5 to 10 feet below the Vic Trace Reservoir.

Due to the anticipated location of the plugged oil well and associated features being located beneath the Vic Trace Reservoir, the subsurface soil assessment activities described below (Tasks 2.3.1 through 2.3.3) are most efficiently and cost effectively completed after the reservoir is drained and removed.

Task 2.2.1 Geophysical Survey

Rincon will subcontract with Subsurface Surveys & Associates, Inc. to clear the proposed soil boring locations and identify underground utilities.

The geophysical survey will also be utilized to investigate the boundary limits of the subsurface sump features, well cap, and well cellar using a magnetometer to detect buried ferrous objects. The surveyors will utilize an integrated global positioning system for data collection. These areas will also be monitored using two different electro-magnetic detectors, which will highlight buried metallic objects, including pipelines and underground structures. Ground Penetrating Radar will be the main instrument used for the detection of backfilled excavations/sump features. The geophysical survey to investigate the boundary limits of the subsurface sump features, well cap, and well cellar can only be conducted once the Vic Trace Reservoir has been removed.

Task 2.2.2 Soil Borings

Rincon will subcontract and oversee BC2 Environmental (a C-57 licensed driller) to complete at least twelve direct push soil borings to a maximum depth of 15 feet below ground surface (bgs) to assess the presence or absence of a historical drilling sump and "sump material" (Figure 3). The term "sump material" is an umbrella term used to describe soil impacted by drilling fluids or muds that originated from historical drilling operations. Sump material is used here to describe in-place sump deposit which is generally not mobile and does not migrate more than a foot from the sump feature where it was circulated during drilling operations.

Each boring location will be cleared using a hand auger to a depth of 5 feet below grade. The direct push borings will be continuously cored by hydraulically driving a two-inch diameter sampling rod into the ground. The macro-core sampler consists of a two-inch diameter tube containing a 4-foot-long acetate sleeve liner. By advancing this sampler into the soil, soil is forced into the opening of the sampling tube and a sample is obtained. Once the sampler is filled, it is retrieved, and the acetate liner is removed. Soil samples will be retrieved as described in the field procedure included in Attachment 3.

Rincon personnel will use a step-out approach, advancing the first several borings in the expected center of the observed sump features (Figure 2). If sump material is encountered in any of the initial borings, additional borings will be advanced approximately 20 feet from the center boring. If any of the subsequent borings reveal sump material, Rincon will delineate the vertical extent of impacts and

collect two soil samples from each boring (one impacted and one clean) for laboratory analyses. If the initial borings do not yield indications of sump material, the soil boring locations may be revised to focus on other features or anomalies identified during the geophysical survey. The number, location, and depth of the soil borings may change based on observed conditions in the field. For this investigation, Rincon has assumed that a total of at least twelve soil borings to a maximum depth of 15 feet below grade will be completed.

At the conclusion of soil sampling activities, the soil borings will be backfilled with hydrated bentonite to within 6 inches of existing grade. Clean soil will be used to backfill the top 6 inches of the borehole. The soil boring locations will also be located with a handheld GPS unit.

Task 2.2.3 Soil Sampling and Analyses

Soil samples will be collected at 5-foot intervals to a total depth of 15 feet below grade; however, sample depths may be adjusted in the field to collect soil samples based on changes in lithology, depths exhibiting field evidence of "sump material," and from the bottom of the boring.

The soil types and other pertinent information regarding subsurface conditions will be recorded and logged in accordance with the United Soils Classification System (USCS). Soil boring logs will include total depth, depth of samples, soil classification, and depth/intervals of soil types encountered. A calibrated photoionization detector will be used to screen the soil samples for the presence of volatile organic compounds. The boring logs will be included as an appendix to the report as described in Task 3 below.

If no apparent sump material is observed in any of the borings, then select soil samples collected from the 5-foot and 10-foot intervals will be selected for laboratory analyses to provide documentation that sump material is not present. Historic drilling sumps were generally 10 to 20 feet deep, however based on the excavation and grading that occurred when the reservoir was constructed, it is likely sump material would be no greater than 10 feet bgs.

Soil samples will be couriered to Eurofins Calscience LLC, a state-certified analytical laboratory under chain-of-custody (COC) protocol. The COC will include, at a minimum, the requested analyses, sample dates and times, sample identifications, and signatures recording the changes of possession in accordance with the field procedures detailed in Attachment 3. A maximum of 25 soil samples will be submitted to the laboratory and analyzed for the following:

- Total petroleum hydrocarbons (TPH) full range using United States Environmental Protection Agency (USEPA) Method 8015M; and
- Benzene, toluene, ethylbenzene, and total xylenes using USEPA Method 8260B.

One waste characterization sample will be selected based on the sample with the highest total TPH concentration samples. The selected sample will additionally be analyzed for the following:

- Semi-volatile organic compounds and polyaromatic hydrocarbons Select Ion Monitoring using USEPA Method 8270;
- Chlorinated pesticides and polychlorinated biphenyls using USEPA Methods 8081/8082;
- CAM 17 Metals using USEPA Method 6010B/7471A;
- Ignitability (Flashpoint) using EPA 1010/1020; and
- pH using EPA 9040C.

Investigative derived waste (IDW) will be containerized in two 55-gallon drums and stored on-site pending analyses. IDW will be profiled for disposal upon receipt of the analytical results. Rincon will subcontract a state certified disposal company to conduct the removal and transport of the IDW off-site for disposal.

Task 2.3 Shallow Soil Sampling and Analyses Outside the Perimeter of the Reservoir

Rincon will collect soil shallow samples from a depth of approximately 0.5 feet below grade, approximately every 50 feet along the perimeter of the Vic Trace Reservoir to evaluate the shallow soil for potential lead impacts associated with LBP that may have been used on the reservoir structure. At a minimum, the logs will include classification of the soil per the USCS and a description of any discoloration or odors noted in the soil. The boring logs will be included as an appendix to the report.

Up to 25 shallow soil samples will be collected using a hand auger, hand trowel, or similar as described in the field procedure in Attachment 3. The soil samples will be analyzed for the following:

- Total Lead using USEPA Method 6010B.

Task 2.4 Hazardous Building Materials Survey

Due to the age of the Vic Trace Reservoir, a hazardous materials survey will be conducted. The purpose of this testing is to identify the presence of ACM and LBP (or lead components) prior to demolition activities. Rincon will subcontract FCG Environmental to conduct the hazardous materials survey and sampling. The ACM survey will be conducted by a California Division of Occupation Safety and Health Certified Asbestos Consultant/Site Surveillance Technician. The LBP survey will be conducted by a State of California Department of Public Health Services Certified Lead Inspector/Risk Assessor for LBP. The surveys will be completed concurrently and will be based on a visual inspection of the structure, knowledge of building components, and collection of bulk samples and field readings to document asbestos and lead paint concentrations in suspect materials. The survey will be performed as follows:

- **Asbestos Bulk Sampling.** Up to 20 bulk samples will be collected from identified suspect existing building materials for asbestos analysis. Bulk samples will be couriered under COC to an accredited laboratory for asbestos analysis by polarized light microscopy method using USEPA Method 600/R-93-116.
- **Lead Paint and Component Screening.** Testing of lead-based paint or lead components will be conducted using an x-ray fluorescence (XRF) analyzer. The XRF sampling method uses a field instrument (XRF gun) to characterize suspect painted surfaces and components. The survey attempts to define the extent of LBP and estimated quantities where possible. Up to 10 LBP bulk samples (paint chips, soils, dust wipes, etc.) may be collected for analysis.

Task 3 Environmental Site Investigation Report

Upon completion of field activities and following the receipt of results from the analytical laboratory, Rincon will prepare an Environmental Site Investigation report (Report) presenting the results of the field activities described in Task 2.3 and 2.4. The Report will describe the completed scope of work; include analytical data summary tables, figures depicting the soil sampling locations, figures depicting the hazardous materials sampling locations, and a photo log; and provide conclusions and recommendations.

Schedule

Upon the EHS approval of this Work Plan, field work described in Task 2.3 and Task 2.4 can be implemented and will take approximately one day to complete. Rincon will provide the City of Santa Barbara a data summary for the results of the shallow soil sampling (Task 2.3) and hazardous materials survey (Task 2.4) approximately three weeks following completion of the fieldwork.

After the demolition phase of the reservoir replacement, the subsurface soil investigation field work (Task 2.2) will take approximately five days to complete. The schedule of the fieldwork will be dependent on access and subcontractor availability.

Rincon will provide an Environmental Site Investigation Report describing the full scope of work included in this Work Plan to the City of Santa Barbara approximately three weeks following receipt of analytical data. The report will include a summary of the sampling methodologies, figures depicting the sampling locations, tabulated analytical results, conclusions, and recommendations. A final report, signed and stamped by a California Professional Geologist, will be submitted to EHS following review and approval by the City of Santa Barbara.

Please contact us with any questions regarding this Work Plan.

Sincerely,
Rincon Consultants, Inc.

219 San Marcos Building
Santa Barbara, California
September 30, 1935

Capt. E. M. Sherrill, Agent,
Dralock Oil Company,
14 E. Carrillo Street,
Santa Barbara, California.

Receipt Acknowledged
S. F. Office

Dear Sir:

Your report of abandonment of well No. "Beckstead" 1, Sec. 28, T. 4 N., R. 27 W., S. B. B. & M., Mesa oil field, Santa Barbara County, dated September 14, 1935, and submitted to this Division on our Form 103, has been examined in conjunction with records filed in this office.

A review of the reports and records shows that the requirements of this Division, which are based on all information filed with it, have now been fulfilled.

Yours truly,

R. D. BUSH
State Oil and Gas Supervisor

By _____
Deputy Supervisor.

Special Report on Operations Witnessed

No. T 3-1268

Santa Barbara, Cal. September 30, 1935

Mr. Capt. E. M. Sherrill,
Santa Barbara, Cal.
Agent for Dralock Oil Company

DEAR SIR:

Operations at your well No. "Beckstead" 1 Section 28, T. 4 N., R. 27 W., S. B. B. & M., Mesa Oil Field, in Santa Barbara County, were witnessed by S. G. Dolman, representative of the supervisor, on September 15, 1935. There was also present M. H. Fuller, Superintendent, and E. B. Rhoads, driller

Casing Record 10-3/4" cemented 104'; Total Depth 1555'

The operations were performed for the purpose of testing the location and hardness of a cement plug proposed to be placed from 84' to 134' in the process of abandonment.

and the data and conclusions are as follows:

MR. FULLER REPORTED THE FOLLOWING:

1. The hole was filled with heavy mud to 134'.
2. A wooden plug was driven to 136', and on September 14, 1935, 20 sacks of Victor cement was dumped at 136'.

THE DEPUTY SUPERVISOR NOTED THE FOLLOWING:

1. The bailer could not be spudded below 75' and brought up a sample of set cement.

THE LOCATION AND HARDNESS OF THE CEMENT PLUG AT 75' ARE APPROVED.

Report on Proposed Operations

No. P 3-2536

Santa Barbara, Cal. September 30, 1935

Mr. Capt. E. M. Sherrill,
Santa Barbara, Cal.
Agent for Dralock Oil Company

DEAR SIR:

Your proposal to abandon Well No. "Beckstead" 1, Section 28, T4 N., R.27 W., S.B. B. & M., Mesa Oil Field, Santa Barbara County, dated Sept. 14, 1935, received Sept. 30, 1935, has been examined in conjunction with records filed in this office.

Present conditions as shown by the records and the proposal are as follows:

RECORDS: The condition of the well is as stated in the notice.

THE NOTICE STATES:
"The present condition of the well is as follows:
10-3/4" cem. 104'
T. D. 1578'
No oil or gas showings encountered."

PROPOSAL:
"The proposed work is as follows:
1. Fill hole with heavy mud to 134'
2. Place cement plug 84' to 134'
3. Fill hole with heavy mud to surface.
4. Cap at surface and abandon."

DECISION:
THE PROPOSAL IS APPROVED PROVIDED THAT:
1. THIS DIVISION SHALL BE NOTIFIED TO WITNESS:
The location and hardness of cement plug at 80'.

Notice of Intention to Abandon Well

This notice must be given at least five days before work is to begin

Santa Barbara Cal. Sept 14 1935

Mr. J. G. Dolman

Deputy State Oil and Gas Supervisor

Santa Barbara Cal.

DIVISION OF OIL AND GAS
RECEIVED
SEP 3 01935
SANTA BARBARA, CALIFORNIA

Dear Sir:

In compliance with Section 16, Chapter 718, Statutes of 1915, as amended, notice is hereby given that it is our intention to abandon well No. "Beckstead" 1, Sec. 28, T. 4 N R. 27 W, S.B. B. & M., Mesa Oil Field, Santa Barbara County, commencing work on the 14th day of September 1935

The present condition of the well is as follows:

10 3/4" cem. 104'
T.D. 1578'
No oil or gas showings encountered.

The proposed work is as follows:

1. Fill hole with heavy mud to 134'
2. Place cement plug 84' to 134'
3. Fill hole with heavy mud to surface.
4. Cap at surface and abandon.

Respectfully yours

Report on Proposed Operations

No. P 3-2514

Santa Barbara, Cal. August 16, 1935

MR. J. W. Drake,

Santa Barbara, Cal.

~~Agent~~ for Dralock Oil Company

DEAR SIR:

Your proposal to drill Well No. "Beckstead" 1,

Section 28, T. 4 N., R. 27 W., S.B. B. & M., Mesa Oil Field, Santa Barbara County,

dated Aug. 14, 1935, received Aug. 16, 1935, has been examined in conjunction with records filed in this office.

Present conditions as shown by the records and the proposal are as follows:

THE NOTICE STATES:

"The elevation of the derrick floor above sea level is 440 feet.
The well is 480 feet S. and 2120 feet E. from NW Cor Sec 28
Lease consists of 60 acres
We estimate that the first productive oil or gas sand should be encountered at a depth of about 1500 feet, more or less.
Well is to be drilled with rotary tools."

PROPOSAL:

"We propose to use the following strings of casing, either cementing or landing them as herein indicated:

Size of Csg., In.	Weight, Lb. Per Foot	New or Second Hand	Depth	Landed or Cemented
10"	45	Used	100	Cemented

Balance of casing program to be determined by coring
It is understood that if changes in this plan become necessary we are to notify you before cementing or landing casing."

DECISION:

THE PROPOSAL IS APPROVED PROVIDED THAT:

1. Mud fluid of not less than 70 lb. per cubic foot shall be used in the drilling of the well and the column of mud fluid shall be maintained at all times to the surface, particularly while pulling the drill pipe.
2. Adequate blow-out prevention equipment shall be provided and ready for operation at all times.
3. THIS DIVISION SHALL BE NOTIFIED TO WITNESS:
   A bailing test of each possible water shut-off.

Notice of Intention to Drill New Well

This notice must be given before drilling begins

Santa Barbara Cal. Aug 14 1935

Mr. J. G. Dolman

Deputy State Oil and Gas Supervisor

Santa Barbara Cal.

DIVISION OF OIL AND GAS
RECEIVED
AUG 1 6 1935
SANTA BARBARA, CALIFORNIA

Dear Sir:

In compliance with Section 17, Chapter 718, Statutes of 1915, as amended, notice is hereby given that it is our intention to commence the work of drilling well No. "Beckstead" 1, Sec. 28, T. 4 N., R. 27 W., S. B. B. & M., Mesa Oil Field Santa Barbara County.

Lease consists of 60 acres

The well is 480 feet ~~N.~~ or S., and 2120 feet E. or ~~W.~~ from NW Cor Sec 28
(Give location in distance from section corners or other corners of legal subdivision)

The elevation of the derrick floor above sea level is 440 feet.

We propose to use the following strings of casing, either cementing or landing them as herein indicated:

Size of Casing, Inches	Weight, Lb. Per Foot	New or Second Hand	Depth	Landed or Cemented
10"	45	Used	100	Cemented.
Balance of casing program to be determined by coring				

Well is to be drilled with rotary ~~cable~~ tools.

It is understood that if changes in this plan become necessary we are to notify you before cementing or landing casing.

We estimate that the first productive oil or gas sand should be encountered at a depth of about 1500 feet, more or less.

Respectfully yours

Address 2701 Laural Canyon Road
Santa Barbara

RECEIVED
AUG 1 C 1935
SANTA BARBARA, CALIFORNIA

Dear Sir:

Enclosed herewith you will please find bond executed by Dralock Oil Company as principal and Coast Surety Company as surety, in connection with the oil well to be drilled on our property in the Mesa Field in Santa Barbara.

Trusting this is satisfactory, we are,

Yours very truly,
DRALOCK OIL COMPANY
By L. M. Lockhart.

Quality Assurance/Quality Control Plan

1 Quality Assurance/Quality Control Plan

1.1 Definitions

- Constituents of Concern (COCs) – The chemicals or groups of chemicals that are suspected of or identified as impacting a site
- Data Quality Objective (DQO) – performance and acceptance criteria for the data generated from a site assessment
- Work Plan – The document that specifies the sampling rationale and specific work scope for a site assessment. The Work Plan may or may not be subject to regulatory review. The Work Plan may call for the use of some or all of the methodologies described herein, and should be viewed as a companion document to these Field Procedures

1.2 Introduction

This Quality Assurance/Quality Control Plan (QA/QC Plan) is intended to identify methods to ensure quality data are produced which will comply with applicable federal and state regulations, and which will meet the overall project objectives for precision, accuracy, completeness, representativeness, and comparability.

1.3 Data Quality Objectives

The overall data quality objective (DQO) is to produce data of suitable quality for its intended use. Analytical results will be validated as of suitable quality if the specified DQOs on precision, accuracy, representativeness, completeness, and comparability are achieved, as described below:

- **Precision.** Precision is assessed by analysis of laboratory QC samples and duplicate or replicate field samples using relative percent difference (RPD) between analytical results. The RPD will be calculated as follows:

$$\%RPD = 200x\frac{X_2 - X_1}{X_2 + X_1}$$

Where: X_1 *= the smaller of the two samples*

X_2 *= the larger of the two samples*

If the RPD between the primary and replicate field samples exceed the laboratory limits, data will be qualified.

- **Accuracy.** Accuracy is assessed by analysis of laboratory QC samples, surrogate standards, matrix spikes, and instrument calibrations, using percent recovery (%R). The %R is calculated as follows:

$$\%R = 100\ x \frac{X_S - X}{T}$$

Where: X_S *= the spiked sample concentration*

X = the un-spiked sample concentration

T = the true value of the spike solution added

Statistically derived laboratory accuracy limits will be included in the laboratory analytical reports, and if they are exceeded, the results will be flagged.

Field accuracy will be assessed through accuracy of the field instruments and travel blanks; the DQO for field blank samples is that constituents of concern (COCs) values are less than the reporting limits. If COCs are reported in the blanks, data will be qualified.

- **Representativeness.** Representativeness will be addressed by the specification of proper sample locations and numbers; sample collection techniques and decontamination procedures; appropriate laboratory methods, and proper field and laboratory QA/QC procedures.
- **Completeness.** Completeness is assessed by comparing the number of valid results actually collected to the planned value using the following equation:

$$\%Completeness = 100x \frac{number\ of\ valid\ results}{number\ of\ planned\ results}$$

The DQO for completeness is to collect 90% of the planned data.

- **Comparability.** Comparability will be addressed by specifying laboratory analytical methods that are consistent with current standards of practice.

1.3.1 Quality Assurance and Quality Control

A QC program will be used to control and evaluate the quality of the data generated during sampling. To that end, the following QA/QC methods will be strictly followed:

- **Equipment Decontamination.** All non-dedicated equipment will be decontaminated as appropriate for the medium being sampled, and in accordance with the specific field procedures summary.
- **Standards.** Current standards will be used for calibration of instruments and sample preparation.
- **Supplies.** Tools and supplies will be inspected for integrity prior to field or laboratory use.
- **Holding Times.** Method holding times will be met during sample preparation and analysis. If holding times are exceeded, the data will be qualified on the laboratory reports and on the analytical tables.

1.3.2 Field Quality Control Samples

As indicated by the Work Plan, the following types of QA/QC samples may be collected during sampling activities to document the reliability of data generated during sampling; each sample will be analyzed using the methods described in the Work Plan.

- **Duplicates.** Duplicate samples will be collected from each medium sampled during the field program, at a ratio of 10% of the total number of samples planned to be collected.
- **Travel Blank.** A travel blank sample will be transported from the laboratory to the site and transported back without having been exposed to sampling procedures. One travel blank will be transported per sample shipment containing samples for volatile organic compound analysis for each day of sampling, and the sample ID will include "TB".
- **Equipment Blank.** Equipment blank samples will be collected once a day (after decontamination of reusable equipment), and when new equipment is brough onsite, to assess for possible cross-contamination during sample collection. The sample ID will include "EB".

1.3.3 Laboratory Quality Control/Quality Assurance

Laboratory QC procedures will be required for verifying and maintaining performance quality for chemical analysis. Analytical batches will include an initial calibration, a method blank, laboratory control samples and a laboratory control sample duplicate including laboratory matrix spike and matrix spike duplicates (MS/MSD).

Detection Limits

The Detection Limits are the concentrations below which COCs are reported as not detected; undetected concentrations will be reported as less than the value of the Detection Limit. The Detection Limits are set by the analytical laboratory, and are described in the Work Plan. Detection limits will be such that analytical results meet DQOs.

Per 40 Code of Federal Regulations (CFR), part 136, Appendix B, the method detection limit (MDL) is defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. The practical quantitation limit (PQL) is typically 2 to 10 times the MDL. A detection between the MDL and the PQL is flagged by the laboratory (J flag) to indicate that the laboratory cannot reliably quantify the detection. Laboratories are required to report all detections and all data qualifiers..

Field Procedure

1 Soil Matrix Sampling – Geoprobe Rig

1.1 Definitions

- Core – The length of soil contained within the sample liner
- Custody Seal – A laboratory provided seal added to the sample containers or sample cooler once sampling has been completed to identify and protect the integrity of the samples (typically only used if samples will be shipped)
- Depth interval – The specific depths below grade represented by the core
- Photoionization Detector (PID) – A type of gas detector that can qualitatively measure volatile organic compounds in real time
- Probe rod – A metal tube that is driven into the subsurface; the sample liner is installed inside of the probe rod to collect a soil core
- Sample – The section of the core which will be removed for laboratory analysis
- Sample liner – A plastic (acetate) tube installed into the
- Target sample depth – The bottom of the depth interval
- Temperature blank - A vial filled with tap water and stored in the cooler during sample collection and transportation (not required for all projects)
- Trip blank - A laboratory provided, volatile vial container filled with lab grade deionized water, affixed with a custody seal. This blank represents the "trip" the volatile vials take from leaving the lab with the bottle order to the field for sample collection and back to the lab for analysis
- Work Plan – The document that specifies the sampling rationale and specific work scope for a site assessment. The Work Plan may or may not be subject to regulatory review. The Work Plan may call for the use of some or all of the methodologies described herein, and should be viewed as a companion document to these Field Procedures

1.2 Introduction

This Field Procedure describe the methodology and techniques used to collect soil matrix samples from a Geoprobe rig.

Geoprobe drill rigs retrieve soil samples using direct push technology (DPT) and a dual tube system. A metal probe rod containing a dedicated acetate sample liner is driven into the ground using a hydraulic hammer to produce a continuous core. By advancing this dual tube system into the sub-surface, soil is forced into the open end of the sample liner as a core. When the target sample depth is reached, the sample liner containing the core is retrieved from the probe rod, cut at the target sample interval, and retained for delivery to the laboratory. Unretained portions of the core are used to log the stratigraphy.

1.3 Equipment and Instrumentation

The following is a list of instruments and equipment used during field activities.

Typically Provided by Driller	Typically Provided by the Laboratory	Rincon Equipment
Geoprobe Drill Rig	Custody seal[1]	Level D personal protective equipment (PPE) and project-specific PPE as specified in the Work Plan
Hack saw and liner cutter	Sample cooler	Ice for cooler
Teflon tape	Trip blank[1]	Resealable plastic sample bags
Sample caps	Temperature blank[1]	Photoionization detector (PID)
Investigation derived waste container (55-gallon drum)	EPA Method 5035 kits[1]	Measuring tape
5-gallon bucket		Field sheets
Trash bag		GPS with sub-meter accuracy
Work table		5-gallon buckets
1 – If needed; see Work Plan		

All instruments will be calibrated per the manufacturer's specifications at the beginning of each workday.

1.4 Sampling

Prior to drilling activities, a tail-gate meeting will be conducted by Rincon field staff to review the procedures that Rincon personnel (and its subcontractors, if applicable) will follow to minimize the potential for health and safety hazards during the course of work. These procedures are detailed in the site-specific Health and Safety Plan.

If a geophysical or utility survey is planned (see Work Plan), it will be conducted prior to the activities described in this document. Drilling into any utilities/obstructions could result in injury and damage to property.

Sample collection will proceed as follows:

1. The location of the boring will be recorded using a GPS with sub-meter accuracy.
2. Upon reaching the target sample depth and retrieving the probe rod and sample liner from the borehole, the driller will hand the sample liner to the Rincon field staff. Special attention will be paid to which end of the sample liner represents the bottom of the core, and to the specific depth interval recovered.
3. The sample liner will be placed on the worktable. Because soil may compress or expand in the sample liner, the total length of the core inside of the sample liner will be measured using a measuring tape, and that measurement will be divided by the length of the depth interval to calculate the effective length of 1-foot of compressed or expanded core. Using a sharpie marker, the sample liner will be divided into suitable lengths to facilitate depth-accurate observations.
4. Using the hacksaw, the sample will be cut from the sample liner into lengths of 6-inches or greater. The ends of the samples will immediately be covered with Teflon tape, and capped with sample caps.
5. If using an EPA Method 5035 kit (5035 kit), soil aliquots will be collected from the end of the sample liner using the kit's dedicated t-handle, and transferred to the kit's vials.
6. Immediately following collection, all samples will be labeled and recorded on a chain-of-custody (COC). Each sample will be marked with the following information:
    - Sample ID, preservative, analysis, sampler, date and time, project number, and company name.
7. Sample containers will be double bagged using resealable plastic bags to protect the sample from moisture and to prevent breakage and potential cross contamination during storage and transportation.
8. The samples will be placed into an insulated cooler with ice (to preserve the samples) at 4 Celsius or below. If required, temperature blanks will be placed in the cooler with the samples. If required, trip blanks will be labeled, recorded onto the COC, and placed in the cooler. Additionally, if required, the custody seal will be applied to the cooler, and the date, time, and sampler's name will be written on it.
9. The un-used portion of the sample liner will be split using the liner cutter, and soil aliquots will be collected from the cut ends adjacent to where the discrete samples were collected, and placed into baggies and set aside. The core will then be logged in accordance with the Universal Soil Classification System (USCS) and ASTM International (ASTM) D2488-93, unless otherwise specified in the Work Plan. Observations will be recorded on field sheets.
10. After at least 5 minutes have elapsed since placing the soil into a plastic baggie, the PID will be used to screen the soil for volatile organic compounds (VOCs) by carefully inserting the PID probe tip into the baggie, and holding the probe tip 1/8-inch away from the soil for 10 seconds. The maximum PID reading will be recorded in parts per million (ppm) on the field sheets.

11. After the soil has been logged, the remaining core will be removed from the sample liner into a 5-gallon bucket, and the sample liner will be disposed into the trash bag.

1.5 Decontamination Procedures

All reusable sampling equipment will undergo a three-stage decontamination process.

Decontamination will proceed as follows:

1. A decontamination station will be pre-established prior to commencement of sampling activities. Three 5-gallon buckets will be used to decontaminate all sampling equipment. An impermeable liner (visqueen) will be placed on the ground beneath the decontamination buckets to prevent/capture liquids from coming into contact with the ground surface.
2. Prior to first use at the site and between each discrete sample location, equipment will be washed using a non-phosphate detergent and potable water (first bucket). Equipment will then be rinsed in potable water (second bucket), and finally rinsed with deionized water (third bucket).
3. All liquids will be containerized prior to appropriate disposal. Equipment intended for one-time use will be packaged for appropriate disposal.

1.6 Investigation Derived Waste

Upon completion of sampling activities, all investigation derived waste (IDW), including decontamination water and un-retained soil cuttings will be stored in a 55-gallon drum or other approved container, and labelled with the following information:

- Contents, generator name, generator address, contact information, and the date of generation.

If specified in the Work Plan, secondary containment may be needed. The container with IDW will then be placed in a secure location as determined in consultation with the client. Disposable sampling equipment and PPE will be disposed in a trash bag.

1.7 Chain-of-Custody Protocol

COC protocols will be employed to protect the integrity of the samples and the traceability of their handling from collection to chemical analysis. The protocol will be in accordance with the protocols detailed in Chapter 9 of the United States Environmental Protection Agency's SW-846 Compendium. The following information will be provided in ink on the COC for each sample:

- Unique sample identifier, date and time of collection, medium type, number of sample containers, requested analyses, GeoTracker Global Id number (where applicable).

In addition, the COC will also include general project information, including, at a minimum:

- Rincon project manager and contact information, name of sampler, Rincon project number, project site address/location, dates and times of relinquishment and receipt, and signature of each person possessing samples.

The COC will be kept with the sample shipment at all times. If samples are to be delivered to the laboratory via courier, a copy of the signed COC will be retained (either a carbon copy or photo-documentation) prior to relinquishing the samples to the courier.

1.8 Record Keeping

Field activities and sample collection details will be recorded on field sheets. Field sheets will be completed in real-time during each day of field work, and will include the following information, at a minimum:

- Names of Rincon field staff and other personnel onsite and their companies, weather conditions, a description of site activities, details of field work with corresponding timestamps, and field maps showing sample locations and other relevant site features.

Field sheets will be scanned/uploaded to the project file at the end of each field day, at the end of the field event if multiple days, or at the end of each week if multiple weeks. Rincon will keep the field activity sheets on-file, and they may be provided upon request. Sample collection field sheets will be included in the report.

Rincon Consultants, Inc.

Environmental Scientists *Planners* *Engineers*

Field Procedure

1 Soil Matrix Sampling – Hand Auger

1.1 Definitions

- Auger – A hollow cylinder equipped with cutting bits to bore through soil when manually rotated; placed into the sub-surface to advance the boring and collect disturbed soil samples
- Cross Handle – A t-shaped metal bar that is connected to the auger by the rod(s) and is used to manually rotate the auger
- Custody Seal – A laboratory provided seal added to the sample containers or sample cooler once sampling has been completed to identify and protect the integrity of the samples (typically only used if samples will be shipped)
- Rods – Solid metal bars used to connect the auger and cross handle either with threaded or quick connections
- Sample Liner – A plastic (acetate) tube inserted into the soil core sampler used to recover an undisturbed soil sample
- Slide Hammer – A weight that slides along a rod and replaces the cross handle during sampling; used in combination with the soil core sampler to collect undisturbed soil samples
- Soil Core Sampler – A hollow cylinder without cutting bits that is equipped with a sample liner and is used in place of an auger; used in combination with a slide hammer to collect undisturbed soil samples
- Target sample depth – The bottom of the depth interval
- Temperature Blank - A vial filled with tap water and stored in the cooler during sample collection and transportation (not required for all projects)
- Trip Blank - A laboratory provided, volatile vial container filled with lab grade deionized water, affixed with a custody seal. This blank represents the "trip" the volatile vials take from leaving the lab with the bottle order to the field for sample collection and back to the lab for analysis
- Work Plan – The document that specifies the sampling rationale and specific work scope for a site assessment. The Work Plan may or may not be subject to regulatory review. The Work Plan may call for the use of some or all of the methodologies described herein, and should be viewed as a companion document to these Field Procedures

1.2 Introduction

This Field Procedure describes the methodology and techniques used to advance a boring into soil for the collection of soil matrix samples using a hand auger.

Hand augers are used to advance a boring by manually rotating an auger with cutting bits into the sub-surface; this motion forces soil into the auger. Once the auger is filled with soil, it is brought to the surface, and the soil is examined, used to log the stratigraphy, and either disposed or collected into sample containers. As the auger is advanced deeper into the sub-surface, additional rods are added to the assembly to access greater depths. If desired, when the target sample depth is reached, the auger can be replaced with a soil core sampler, and the cross handle with a slide hammer. As the hammer is manually lifted and dropped, the soil core sampler is advanced into the sub-surface and undisturbed soil is forced into the sample liner. Either the sample liner or the sample containers are delivered to the laboratory for analysis.

1.3 Equipment and Instrumentation

The following is a list of instruments and equipment used during field activities.

Typically Provided by the Laboratory	Rincon Equipment
Custody seal[1]	Level D personal protective equipment (PPE) and project-specific PPE as specified in the Work Plan
Sample containers (jars)[1]	Hand auger
Sample cooler	Rubber mallet
Sample labels	Ice for cooler
Trip blanks[1]	Resealable plastic sample bags
Temperature blanks[1]	Sample caps[1]
EPA Method 5035 kits[1]	Acetate sleeves, caps, and Teflon tape[1]
	Photoionization detector (PID)
	Measuring tape
	Impermeable barrier (Visqueen)
	5-gallon bucket
	Two crescent wrenches
	Field sheets
	GPS with sub-meter accuracy
	Investigation derived waste container[1]
1 – If needed; see Work Plan	

All instruments will be calibrated per the manufacturer's specifications at the beginning of each workday.

1.4 Hand Auger Drilling

Prior to drilling activities, a tail-gate meeting will be conducted by Rincon field staff to review the procedures that Rincon personnel (and its subcontractors, if applicable) will follow to minimize the potential for health and safety hazards during the course of work. These procedures are detailed in the site-specific Health and Safety Plan.

If a geophysical or utility survey is planned (see Work Plan), it will be conducted prior to the activities described in this document. Drilling into any utilities/obstructions could result in injury and damage to property.

Hand auger drilling will proceed as follows:

1. The location of the boring will be recorded using a GPS with sub-meter accuracy.
2. Prior to drilling activities, the impermeable barrier and bucket will be placed adjacent to the target location.
3. The hand auger assembly, consisting of the auger, the rods, and the cross handle, will be connected. If the specific hand auger uses threads, thread tape may be used to prevent binding.
4. Once all components are securely attached and the hand auger assembly is properly connected, it will be placed at the target location such that all auger bits make firm contact with the ground surface.
5. Proper form will be used to minimize the risk of injury, which consists of a wide stance, a straight back, and a firm grip on the cross handle such that strain on the wrists is minimized. Using this form, the cross handle will be rotated clock-wise to advance the auger into the ground surface. Progress into the sub-surface will be checked periodically using the measuring tape.
6. Once the auger fills with soil, the hand auger assembly will be carefully lifted out of the boring. If the target sample depth has been reached, sampling will proceed as described in Section 1.5; if the soil will not be retained as a sample, a portion will be transferred to a plastic baggie and set aside. The remaining soil will be emptied onto the impermeable barrier by tilting the hand auger assembly and either shaking it or tapping it with the rubber mallet. The soil will be examined and logged in accordance with the Universal Soil Classification System (USCS) and ASTM International (ASTM) D2488-93, unless otherwise specified in the Work Plan. Observations will be recorded on field sheets.
7. After at least 5 minutes have elapsed since placing the soil into a plastic baggie, the PID will be used to screen the soil for volatile organic compounds (VOCs) by carefully inserting the PID probe tip into the baggie, and holding the probe tip 1/8-inch away from the soil for 10 seconds. The maximum PID reading will be recorded in parts per million (ppm) on the field sheets.
8. As the boring is advanced deeper into the sub-surface, additional rods will be installed onto the hand auger assembly to extend its length.
9. If a physical impediment is encountered (such as a cobble, lithified strata, gravel, hardpan, etc.) that precludes further advancement with the hand auger, the boring will be marked as

having encountered refusal on the field sheet, and the boring will be backfilled as indicated in the work plan.

1.5 Sampling Procedures

Upon reaching the target sample depth, soil sampling may proceed according to one or both procedures described below, as specified by the Work Plan.

1.5.1 Standard Sampling

1. The hand auger assembly will be carefully lifted out of the boring and transferred to the impermeable barrier.
2. If using an EPA Method 5035 kit (5035 kit), soil aliquots will immediately be collected from the auger adjacent to the bits using the kit's dedicated t-handle and transferred to the kit's vials.
3. The sample container (typically a glass jar) will be held beneath the auger, and soil will be carefully transferred from the auger to the sample container using decontaminated (see Section 5) or dedicated hand tools.
10. The sample container will be properly sealed and labeled as described in Section 1.6. After at least 5 minutes have elapsed since sample collection, the PID will be used to screen the soil for VOCs by carefully inserting the PID probe tip into the sample container, and holding the probe tip 1/8-inch away from the soil for 10 seconds. The maximum PID reading will be recorded in ppm on the field sheets.

1.5.2 Soil Core Sampling

1. A sample liner will be installed into the soil core sampler, and the soil core sampler installed onto the hand auger assembly instead of the auger. The cross handle will be replaced with the slide hammer, and the hand auger assembly will be carefully lowered into the boring.
2. Keeping the back straight, the slide hammer will be manually lifted and dropped repeatedly to advance the soil core sampler into the sub-surface. After the soil core sampler has been pushed a distance equal to its length into the sub-surface, it will be carefully removed to the surface.
3. The sample liner will be removed from the soil core sampler, and one end sealed with Teflon tape and a sample cap. If using a 5035 kit, soil aliquots will immediately be collected from the opposite (un-capped) end of the sample liner using the kit's dedicated t-handle and transferred to the kit's vials.
4. The PID will be used to screen the soil for VOCs by carefully holding the probe tip 1/8-inch away from the soil on the sampler liner's un-capped end for 10 seconds. The maximum PID reading will be recorded in ppm on the field sheets. The sample liner will then be sealed with Teflon tape and a sample cap.

1.6 Post Sampling Procedures

1. Immediately following collection, all samples will be labeled and recorded on a chain-of-custody (COC). Each sample will be marked with the following information:
    - Sample ID, preservative, analysis, sampler, date and time, project number, and company name.
2. Sample containers will be double bagged using resealable plastic bags to protect the sample from moisture and to prevent breakage and potential cross contamination during storage and transportation. If transported by a commercial carrier (shipped), all glass sample containers will be protected with bubble wrap and will be double bagged using resealable plastic bags.
3. The samples will be placed into an insulated cooler with ice (to preserve the samples) at 4 Celsius or below. If required, temperature blanks will be placed in the cooler with the samples. If required, trip blanks will be labeled, recorded onto the COC, and placed in the cooler. Additionally, if required, the custody seal will be applied to the cooler, and the date, time, and sampler's name will be written on it.

1.7 Decontamination Procedures

All reusable sampling equipment will undergo a three-stage decontamination process.

Decontamination will proceed as follows:

1. A decontamination station will be pre-established prior to commencement of sampling activities. Three 5-gallon buckets will be used to decontaminate all sampling equipment. An impermeable liner (visqueen) will be placed on the ground beneath the decontamination buckets to prevent/capture liquids from coming into contact with the ground surface.
2. Prior to first use at the site and between each discrete sample location, equipment will be washed using a non-phosphate detergent and potable water (first bucket). Equipment will then be rinsed in potable water (second bucket), and finally rinsed with deionized water (third bucket).
3. All liquids will be containerized prior to appropriate disposal. Equipment intended for one-time use will be packaged for appropriate disposal.

1.8 Investigation Derived Waste

Upon completion of sampling activities, all investigation derived waste (IDW), including decontamination water and un-retained soil cuttings will be stored in a 55-gallon drum or other approved container, and labelled with the following information:

- Contents, generator name, generator address, contact information, and the date of generation.

If specified in the Work Plan, secondary containment may be needed. The container with IDW will then be placed in a secure location as determined in consultation with the client. Disposable sampling equipment and PPE will be disposed in a trash bag.

1.9 Chain-of-Custody Protocol

COC protocols will be employed to protect the integrity of the samples and the traceability of their handling from collection to chemical analysis. The protocol will be in accordance with the protocols detailed in Chapter 9 of the United States Environmental Protection Agency's SW-846 Compendium. The following information will be provided in ink on the COC for each sample:

- Unique sample identifier, date and time of collection, medium type, number of sample containers, requested analyses, GeoTracker Global Id number (where applicable).

In addition, the COC will also include general project information, including, at a minimum:

- Rincon project manager and contact information, name of sampler, Rincon project number, project site address/location, dates and times of relinquishment and receipt, and signature of each person possessing samples.

The COC will be kept with the sample shipment at all times. If samples are to be delivered to the laboratory via courier, a copy of the signed COC will be retained (either a carbon copy or photo-documentation) prior to relinquishing the samples to the courier.

1.10 Record Keeping

Field activities, sample collection details, and boring logs will be recorded on field sheets. Field sheets will be completed in real-time during each day of field work, and will include the following information, at a minimum:

- Names of Rincon field staff and other personnel onsite and their companies, weather conditions, a description of site activities, details of field work with corresponding timestamps, and field maps showing sample locations and other relevant site features.

Field sheets will be scanned/uploaded to the project file at the end of each field day, at the end of the field event if multiple days, or at the end of each week if multiple weeks. Rincon will keep the field activity sheets on-file, and they may be provided upon request. Boring logs (if completed) will be included in the report.

EH-CMP-23-00106
GeoTracker Global ID# T1000002136

Dear Mr. Ward:

The Santa Barbara County Public Health Department, Environmental Health Services Division (EHS) has reviewed the July 26, 2023 document prepared by Rincon Consultants, Inc. titled *Environmental Site Investigation Work Plan for the Vic Trace Reservoir Replacement Project, 740 Dolores Drive, Santa Barbara, California 93109 (Work Plan).*

The Vic Trace Reservoir was constructed in 1956 and consists of a partially buried rectangular concrete tank. The Vic Trace Reservoir Replacement Project (Project) will replace the existing 10-million-gallon drinking water storage tank with possibly two 5-million-gallon buried concrete tanks. The site is located within the boundaries of the abandoned Mesa Oil Field. Prior to the construction of the Vic Trace Reservoir, the Dralock Oil Company Beckstead #1 Oil Well (API 0408303644) was drilled within the site boundaries in August – September 1935 to a total depth of 1,578 feet below grade (bgs). According to historic records, no oil or gas showings were encountered, and the well was abandoned on September 14, 1935. The dry hole was filled with heavy mud from total depth to 134 feet bgs. A wooden plug was driven to 136 feet bgs and cement was added to a depth of 75 feet bgs.

Aerial photographs from 1928 through 2020 were reviewed and the historical oil well and drilling sump features associated with the Beckstead #1 Oil Well identified in the 1938,

1943, 1947, and 1954 photographs. After georeferencing the site features, it appeared that abandoned oil well and associated sump features were located beneath the Vic Trace Reservoir.

The *Work Plan* outlined the procedures for investigating the following:

- Assessing the presence or absence of a historical drilling sump and potentially oil-impacted material within the sump;
- Delineating the lateral and vertical extent of historical drilling sump;
- Characterizing any encountered drilling sump material for appropriate removal and disposal during reservoir replacement activities, as warranted;
- Assessing shallow soil in the vicinity of the reservoir structure for lead impacts associated with lead-based paint (LBP);
- Characterizing lead-impacted soil for appropriate soil management during reservoir replacement activities, as warranted;
- Conducting a hazardous building materials survey and testing the suspect material in order to identify the presence of asbestos containing materials (ACM) and LBP; and
- Characterizing building materials for appropriate management, or remediation, as part of reservoir.

In order to investigate the former oil well and sump, the workplan proposes to identify the well using a geophysical survey. A magnetometer will be used to detect the metallic well casing, whereas ground penetrating radar will be used to identify the limits of the sump. A direct push drill rig will be used to collect soil samples from 12 locations to a maximum depth of 15 feet below ground surface in order to delineate the vertical and lateral extent of impacts. An initial boring will be drilled at the center of the sump. If sump material is encountered in any of the initial borings, then additional borings will be advanced approximately 20 feet from the center boring until the sump has been delineated. At least two soil samples from each boring will be analyzed. These samples will include a sample from the sump material and clean soil from under the sump material. Soil samples will be analyzed for:

- Total Petroleum Hydrocarbons (TPH) full range using USEPA Method 8015M; and
- Benzene, toluene, ethylbenzene, and total xylenes using USEPA Method 8260B.

For waste characterization, the sample with the highest TPH will also be analyzed for the following:

- Semi-Volatile Organic Compounds (SVOCS) and Polycyclic Aromatic Hydrocarbons (PAHs) using Select Ion Monitoring using USEPA Method 8270;
- Chlorinated pesticides and polychlorinated biphenyls using USEPA Methods 8081/8082;
- CAM 17 Metals using USEPA Method 6010B/7471A;
- Ignitability (Flashpoint) using EPA 1010/1020; and
- pH using EPA 9040C.

Sampling activities will occur after demolition of the reservoir.

Shallow soil samples will be collected from a depth of approximately 0.5 feet bgs, approximately every 50 feet along the perimeter of the Vic Trace Reservoir in order to evaluate the shallow soil for potential lead impacts that may associated with LBP that was used on the reservoir structure. Up to 25 shallow soil samples will be collected and analyzed for Total Lead using USEPA Method 6010B. This sampling will occur prior to demolition of the reservoir.

Due to the age of the Vic Trace Reservoir, a hazardous materials survey will be conducted in order to identify the presence of ACM and LBP (or lead components) prior to demolition activities. The ACM survey will be conducted by a California Division of Occupation Safety and Health Certified Asbestos Consultant/Site Surveillance Technician. The LBP survey will be conducted by a State of California Department of Public Health Services Certified Lead Inspector/Risk Assessor for LBP.

After careful review of the *Work Plan*, EHS approves the *Work Plan* with the following comments:

1. Based upon the depth to groundwater, EHS soil boring permits are not required. However, all soil borings shall be abandoned per California Well Standards, Bulletin 74-90, Monitoring Wells, Part III, Section 19(B).

2. In additional to the proposed analytes, EHS recommends that the soil samples from the well/sump area be analyzed for the full list of Volatile Organic Compounds by USEPA Method 8260B, PAHS by USEPA 8270 SIM, and metals by USEPA Method 6010B/7471A.

3. Soil samples that have total lead detected at 50 mg/kg or greater shall be analyzed for their soluble fraction using the Soluble Threshold Limit Concentration. Soil samples that have total lead detected at 100 mg/kg or greater shall be analyzed for their soluble fraction using the Toxicity Characteristic Leaching Procedure.

4. EHS does not provide oversight for sampling/remediation of ACM and LBP in building materials. EHS recommends contacting the appropriate State agency for further information.

5. As the sampling for lead in soil will likely occur prior to the demolition of the reservoir, please forward these results to EHS within six weeks of competition of field work. If lead exceeds its Tier 1 Environmental Screening Level, non-RCRA Hazardous Waste Criteria, and/or RCRA Hazardous Waste Criteria, then EHS may require enrollment in our Site Mitigation Unit Program to continue oversight on this project.

6. EHS has opened a non-case on GeoTracker (GeoTracker Global ID #T10000021396). EHS requests that you claim this site and upload pertinent information as it becomes available (ie. EDF, Geo_Map, Geo_Bore, Geo_Report)

7. This approval is valid for one year from the date of this letter.

If you have any questions regarding the aforementioned, please do not hesitate to call me at (805) 346-8216. Written correspondence regarding this matter should be sent to EHS at 2125 S. Centerpointe Parkway, Suite 333, Santa Maria, CA 93455, via facsimile to (805) 346-8485, or email toTRejzek@sbcphd.org.

Sincerely,

Thomas M. Rejzek

Subject: Data Summary Submittal - Environmental Site Investigation for the Vic Trace Reservoir Replacement Project, 740 Dolores Drive, Santa Barbara, California 93109

Dear Mr. Rejzek:

Rincon Consultants, Inc. (Rincon), on behalf of the City of Santa Barbara (City), has prepared this Data Summary Submittal for the Environmental Site Investigation for the Vic Trace Reservoir Replacement Project (project), located at 740 Dolores Drive, Santa Barbara, California (site; Figure 1). The purpose of the data summary is to report the results of the shallow soil assessment performed along the perimeter of the reservoir and associated valve building, and hazardous building materials survey conducted prior to demolition activities.

Background

Rincon prepared and submitted the Environmental Site Investigation Work Plan for the Vic Trace Reservoir Replacement Project (Rincon 2023, Work Plan) to the Santa Barbara County Health Department, Environmental Health Services (EHS) on July 26, 2023. As referenced in the Work Plan, the schedule for the subsurface soil investigation associated with the presence or absence of the historic oil well drilling sump will likely be conducted following the demolition phase of the reservoir and will be dependent on access and subcontractor availability. The field work associated with the shallow soil sampling and hazardous materials building survey has been completed and is summarized below.

Regulatory Setting and Screening Levels

Environmental Screening Levels (ESLs) have been established by the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) for chemicals commonly found in soil where releases of hazardous chemicals may have occurred (SFBRWQCB 2019). The ESLs are considered to be health-conservative concentration thresholds designed to be protective of the environment and human health. The SFBRWQCB's ESLs are used by all of the Regional Water Boards in the state of California, including the Central Coast.

Because the project will replace the existing 10-million-gallon drinking water storage tank with possibly two 5-million-gallon buried concrete tanks and site use will not change, the soil results will be compared to the Tier 1 ESL, Construction Worker ESL, and Commercial/Industrial ESL for lead. Additionally, because metals can be naturally occurring at elevated concentrations in the environment, metals are compared to regional Background Levels when Background Levels exceed risk-based

screening levels. A commonly used reference that lists estimates of naturally occurring concentrations of metals in California soil is a Kearney Foundation of Soil Science special report (Kearney 1996).

Shallow Soil Sampling

On October 16, 2023, Rincon collected a total of 25 shallow soil samples from a depth of approximately 0.5 feet below ground surface (bgs) using multiple stainless-steel trowels. Each trowel was decontaminated with an Alconox solution spray and rinsed with distilled water. The small amount of decontamination water was collected in a 5-gallon bucket and had evaporated by the end of field activities. Shallow soil locations SS-1 through SS-22 were located along the perimeter of the Vic Trace Reservoir and SS-23 through SS-25 were located along the perimeter of the valve building (Figure 2).

No soil discoloration or odors were observed during field activities. The majority of the shallow soil observed at the site was clayey sand with gravel. Boring logs from this investigation are provided in Attachment 1.

The soil samples were placed directly into laboratory-supplied containers, labeled, stored in a cooler with ice, and transferred to a courier using chain-of-custody protocol for delivery to Eurofins Calscience, in Tustin, California.

Laboratory Analysis

The shallow soil samples were analyzed for total lead using United States Environmental Protection Agency (USEPA) Method 6010B.

Results

The laboratory analytical results are summarized in Table 1 and the laboratory analytical report is provided in Attachment 2.

Lead was detected at concentrations ranging from 5.01 to 19.4 milligrams per kilogram (mg/kg). None of the detected lead concentrations in shallow soil collected at 0.5 feet bgs surrounding the Vic Trace Reservoir or the valve building exceeded the Tier 1 ESL of 32 mg/kg, Construction Worker ESL of 160 mg/kg, or the Commercial/Industrial ESL of 320 mg/kg. Additionally, all detected lead concentrations are either below or within the Background Level concentration range of 12.4 to 97.1 mg/kg.

Hazardous Building Materials Survey

FCG Environmental (FCG) was subcontracted to perform the hazardous building materials survey of the reservoir and valve building. The Asbestos and Lead Report prepared by FCG is provided in Attachment 3.

The following services were conducted to define potential asbestos and lead concerns at the site by FCG:

- A visual inspection of representative building materials was conducted to identify suspect asbestos and lead paint or other lead materials;
- The asbestos containing building materials (ACM) surveys were conducted by a California Division of Occupation Safety and Health Certified Asbestos Consultant/Site Surveillance Technician and the lead-based paint (LBP) surveys were conducted by a State of California Department of Public Health Services Certified Lead Inspector/Risk Assessor for LBP;
- A total of 23 bulk samples were collected from representative suspect ACMs for submittal to a qualified laboratory for asbestos analysis;

- Screening for lead-based paint was conducted using an X-Ray Fluorescence (XRF) paint analyzer to screen representative surfaces and materials suspected of being coated with lead-based paint. Three bulk samples were analyzed by polarized light microscopy (PLM), to determine asbestos fiber concentrations in bulk building material samples. PLM is applicable for the analysis of building survey submissions and other bulk materials; and
- Three bulk samples were collected from the corrugated metal roofing which appeared to be covered by a light powder coating or sealant. No other painted materials were found on the main reservoir.

Laboratory Analysis

The ACM bulk samples were collected from representative suspect materials and sent to SGS Forensic Analytical for analysis by Polarized Light Microscopy (PLM) using EPA Method 600/R- 93-116, Visual Area Estimation.

The lead bulk samples were analyzed for Total Lead by SGS Forensic Analytical, a state-certified laboratory using EPA Method 3050B/7000B using flame atomic absorption and mass spectrophotometry.

Results

Asbestos

Based on laboratory analytical results and visual observations, asbestos was not detected above the detection limit in any of the suspect building materials sampled as part of FCG's survey. Based on these findings, no ACMs were identified at the site.

Lead

The concrete and wood framing were unpainted, and the corrugated aluminum roofing and siding contained only minor concentrations of lead (12-30 parts per million). All lead findings were well below any regulated levels. Therefore, no LBP or lead concerns were identified as part of FCG's survey.

Conclusions and Recommendations

The results of the shallow soil assessment performed at the site indicate no elevated concentrations of lead are present along the perimeters of the reservoir or valve building. No mitigation measures, or special handling or management for lead impacted shallow soils is required along the perimeters of the reservoir or valve building.

The results of the hazardous building materials survey conducted for the reservoir and valve building indicate that no special handling is required for future demolition of the site building materials that were tested. Materials tested as a part of this survey may be disposed of as regular construction waste.

Surveying of the valve building structure was limited to the roofing and exterior concrete. The interior of this building was not assessed due to lack of access. Additional sampling or inspection of the valve building interior may be required should this structure be demolished or renovated.

The hazardous building materials survey was limited to readily accessible areas. There is potential that suspect materials previously not included or identified by FCG's survey could be discovered during site work. This may include suspect materials located inside the parts of the reservoir underwater or not accessible during FCG's inspection. If suspect materials are found during site demolition or renovation

work, the area should be isolated, and any suspect materials tested to confirm or deny the presence of asbestos, lead, or other hazards.

Sincerely,
Rincon Consultants, Inc.

Laboratory Analytical Report

eurofins | Environment Testing

ANALYTICAL REPORT

PREPARED FOR

Attn: Zach Berghorst
Rincon Consultants
319 E Carillow St
Suite 105
Santa Barbara, California 93101

Generated 10/26/2023 3:23:01 PM

JOB DESCRIPTION

Vic Trace / 22-12664

JOB NUMBER

570-157066-1

Eurofins Calscience
2841 Dow Avenue, Suite 100
Tustin CA 92780

See page two for job notes and contact information.

my EOL

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Calscience Project Manager.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Case Narrative

Client: Rincon Consultants
Project/Site: Vic Trace / 22-12664

Job ID: 570-157066-1

Job ID: 570-157066-1

Laboratory: Eurofins Calscience

Narrative

Job Narrative
570-157066-1

Receipt
The samples were received on 10/17/2023 5:05 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 4.6º C.

Metals
Method 6010B: The serial dilution performed for the following sample associated with batch 570-376952 was outside control limits for Lead: (570-157334-B-3-A SD ^25)

Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-375607 and analytical batch 570-376952 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Detection Summary

Client: Rincon Consultants

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Hazardous Building Materials Survey

November 3, 2023

Ms. Julie Doane Allmon
Senior Supervising Geologist
Rincon Consultants, Inc.
805-453-8137 Mobile
805-277-9473 Direct
jdallmon@rinconconsultants.com

Subject: **Asbestos & Lead Survey Report**
Vic Trace Reservoir – City of Santa Barbara
La Coronilla Drive, Santa Barbara, CA
FCG Project Code: Rincon Consultants–37

Dear Ms. Allman:

FCG Environmental (FCG) conducted a hazardous materials survey of the Vic Trace Reservoir, which included asbestos and lead bulk sampling. The investigation was performed on October 16, 2023, by Alan Forbess, CA Certified Asbestos Consultant (No. 94-1549) and CA Lead Inspector/Assessor and Project Monitor (No. 505/504). This report documents the results of our survey, which was conducted to identify proper handling of building materials prior to demolition or renovations to the existing reservoir.

1.0 Background Information / Scope of Project

Background/Site Description: According to information provided to FCG, the reservoir is a concrete structure roughly 382 feet long by 250 feet wide covered by a wood-framed aluminum roofing and siding. The reservoir is in-ground with upper walls and roofing above grade. A central ridge vent runs east-to-west across the length of the reservoir. The surfaces around the reservoir are paved with asphalt and concrete with concrete drainage swales to direct runoff away from the reservoir. Newer concrete paving was noted in the SW corner of the site, with fencing running along the perimeter on all sides. A valve building is located to the north of the reservoir near the main entrance on La Coronilla Drive. Limited testing was conducted from the valve building exterior only, as the building was locked and inaccessible. Please see the attached photos for additional information.

Scope of Project: FCG was asked to perform a survey of building materials to identify hazardous materials concerns in accordance with federal, state and local regulations. The following services were conducted to define asbestos and lead concerns at the subject site:

- A visual inspection of representative building materials was conducted to identify suspect asbestos and lead paint or other lead materials. Digital photographs were taken, and selected photos are attached for review.
- Bulk samples were collected from representative suspect materials for submittal to a qualified laboratory for asbestos analysis. All bulk samples were analyzed by SGS Forensic Analytical, a state-certified laboratory located in Carson, CA. All samples were

analyzed by polarized light microscopy (PLM), to determine asbestos fiber concentrations in bulk building material samples. PLM is applicable for the analysis of building survey submissions and other bulk materials.
- Screening for lead-based paint was conducted using an X-Ray Fluorescence (XRF) paint analyzer to screen representative surfaces and materials suspected of being coated with lead-based paint.
- All field observations, laboratory analytical data, XRF readings and other findings have been evaluated, with this written report summarizing our findings and providing recommendations as necessary.

2.0 Asbestos Survey Findings

Suspect Materials: After a visual inspection at the subject site was completed, the following suspect asbestos containing materials were noted:

- Caulking mastics inside hatches
- Caulking on roof fasteners
- Rubber washers on metal fasteners (roof)
- Concrete walls – main reservoir
- Concrete drainage swales
- Caulking in drainage swale (concrete seams)
- Asphalt pavement/surfacing around reservoir (apron)
- Concrete pavement/surfacing (apron and curbs, etc.)
- Foam insulation on underside of ridge vent
- Rubber gaskets at ridge vent
- Metal roof coating (these samples are on a separate chain-of-custody)
- Valve Building roofing materials (felts, tars, aggregate, etc.)
- Valve Building concrete walls

Bulk Sampling Results: FCG collected a total of 23 bulk samples from suspected asbestos containing materials at the subject site. The samples were collected and forwarded to SGS Forensic Analytical, for analysis by Polarized Light Microscopy (PLM) using EPA Method 600/R-93-116, Visual Area Estimation.

Summary of Lab Results: Based on laboratory analytical results, all of the suspect building materials tested as part of our survey were found to be “Non-Detect” for asbestos. **Therefore, no asbestos containing materials (ACM) were identified during our survey.** Please refer to the Attachments for a complete copy of the laboratory analytical report and our bulk sampling log sheet.

3.0 Limited Lead Survey

FCG was contracted to perform field testing to determine the presence of lead-based paint or lead components at the subject site. A visual inspection was conducted to identify areas of suspect lead-based paint or coatings. All fieldwork was conducted by a CA Certified Lead Inspector/Assessor. The findings of this survey will be used by contracting personnel to determine appropriate lead safe work practices prior to future site work.

Background Information on Lead Paint Requirements: Several regulations apply to the disturbance and possible exposure to lead from paints and other coatings. Title 17 of the California Code of Regulations (CCR) applies to residences and buildings accessible to the public that were constructed prior to 1979, and schools constructed before 1993 where lead paint may exist. Cal-OSHA regulations found within Title 8 of the CCR apply to worker exposure as stated in the Lead-in-Construction Standard (8-CCR-1532.1). The EPA recently issued a final rule to address lead-based paint hazards created by renovation, repair and painting activities that disturb lead-based paint in target housing and child-occupied facilities.

The EPA's Lead Renovation, Repair and Painting (RRP) Program was passed into regulation requiring compliance with training and certification requirements per Title 40 of the Code of Federal Regulations (40 CFR Part 745). The RRP rule states that firms and individuals conducting renovations of target housing constructed before 1978 must assume that lead is present in all painted surfaces or coatings unless a written determination has been made by a Certified Inspector that the components affected by the renovation are free of paint or other surface coatings that contain lead equal to or in excess of 1.0 milligrams per square centimeter (mg/cm^2) or 0.5% by weight.

***Scope of Lead Testing Services*:** FCG's scope of services involved sampling through use of bulk sampling or "paint chip" methods. Paint chip sampling methods were utilized to remove the surface coating down to the substrate to determine the presence of lead-based paint in relevant surfaces. Samples were forwarded to SGS Forensic Analytical Laboratories for analysis by EPA Methods 3050B/7000B for Total Lead using atomic adsorption and an acid digestion process. Please see the attached laboratory analytical report for detailed information.

Bulk Sample Results: Three bulk samples were collected from the corrugated metal roofing which appeared to be covered by a light powder coating or sealant. No other painted materials were found on the main reservoir. Bulk sampling was conducted according to the specifications described in the protocols for Risk Assessments in the Housing and Urban Development (HUD) Guidelines Chapter 5 (revised 1997). The HUD "Guidelines" are the industry standard for lead mitigation and abatement tasks. Bulk lead samples were analyzed for Total Lead by SGS Forensic Analytical, a state-certified laboratory using EPA Method 3050B/7000B using flame atomic absorption and mass spectrophotometry. Please see the table below for a summary of paint chip sample results and the attached laboratory analytical data for additional information.

Table 1: Lead Paint Chip Sampling Results

Sample ID	Material	Location	Concentration of Lead in PPM (mg/kg)	Lead Based Paint / Hazardous Waste* (Total Lead in ppm)
Pb-1	Metal Roofing with Coating	Roof Cover - North	12	5,000 / 1,000
Pb-2	Metal Roofing with Coating	Roof Cover - West	22	5,000 / 1,000
Pb-3	Metal Roofing with Coating	Roof Cover - South	30	5,000 / 1,000
Regulatory definition of Lead-Based Paint (LBP) = 5,000 ppm or 0.5% by weight. Hazardous Waste definition for Total Lead = 1,000 ppm Please refer to the attached laboratory analytical report for additional information.				

Summary of Bulk Sample Results for Lead: All three of the collected bulk samples taken from the corrugated roofing and siding materials were found to be well below the state and federal definition of lead based paint (LBP) and hazardous waste criteria for Total Lead. No other painted materials were identified within the project scope. Please see the attached analytical data for a complete copy of the laboratory report and bulk sampling information.

4.0 Conclusions & Recommendations

An asbestos and lead survey of the subject site has been completed per the terms of our agreement to define hazardous materials issues prior to demolition or renovation activities. Based on our visual observations and our evaluation of analytical data, we conclude the following:

Asbestos:

- Based on laboratory analytical results and our visual observations, no asbestos was detected in any of the suspect building materials sampled as part of our survey. Based on these findings, no asbestos containing materials (ACM) were identified at the subject site.

Lead:

- No lead based paint or lead components were found at the subject site. The concrete and wood framing were unpainted, and the corrugated aluminum roofing and siding contained only minor concentrations of lead (12-30 ppm). All lead findings were well below any regulated levels. Therefore, no lead-based paint (LBP) or lead concerns were identified as part of our survey.

General Recommendations:

- Based on the absence of asbestos and lead within the reservoir structure, no special handling is required. Future site work may be conducted by regular construction personnel and the materials tested may be disposed of as regular construction waste.
- Our survey of the Valve Building structure was limited to roofing and exterior concrete only. We could not access the interior of the building. If this building will be demolished or renovated, additional sampling or inspection of the building interior should be conducted.
- As our survey was limited to readily accessible areas, there is potential that suspect materials previously not included or identified by our survey could be discovered during site work. This may include suspect materials located inside the parts of the reservoir underwater or not accessible during our inspection. If suspect materials are found during site demolition or renovation work, the area should be isolated, and any suspect materials tested to confirm or deny the presence of asbestos, lead or other hazards.

Limitations Statement

The data compiled and evaluated as part of this assessment was limited and may not represent all conditions at the subject site. Asbestos was widely used until the late 1970's in thousands of building materials (i.e., joint compound, wallboard, thermal system insulation (TSI), acoustical ceiling, roofing material, etc.), making it difficult to locate all areas of ACM usage. This assessment reflects the data collected from the specific locations tested to identify Asbestos Containing Materials (ACM) in those locations and may not be all encompassing. There is always potential for asbestos containing materials to be missed due to problems with accessibility, and the broad variety of uses. The presence or absence of lead-based paint or lead-based paint hazards applies only to the tested or assessed surfaces on the date of the field visit. It should be understood that conditions noted within this report were accurate at the time of the inspection and in no way reflect the conditions at the property after the date of the inspection. All data collection, findings, conclusions and recommendations presented by FCG within this report are based upon limited data using current standard practices accepted within the industry. The conclusions and recommendations presented within this report are based on current regulations and the professional experience of the certified professionals involved in this project.

The data collected during this assessment and any resulting recommendations shall be used only by the client for the site described in this report. Any use or reliance of this report by a third party, including any of its information or recommendations, without the explicit authorization of the client shall be strictly at the risk of the third party.

It should not be misconstrued that this assessment has identified any or all environmental conditions at the subject site. FCG makes no representations regarding the accuracy of the enclosed data and will not be held responsible for any incidental or consequential loss or punitive damages including but not limited to, loss of profits or revenues, loss of use of a facility or land, delay in construction or action of regulatory agencies.

If you have any questions or concerns regarding the information provided, please do not hesitate to call us at 805.646.1995.

Site Plan & Selected Photos

Site Plan - Vic Trace Reservoir

Vic Trace Reservoir, looking south showing metal roofing and siding over concrete structure with asphalt paving on perimeter.

Vic Trace Reservoir, looking west showing drainage swale and fencing beyond the asphalt paving along the perimeter, with the covered reservoir on the left.

Corrugated metal roofing and siding.

Ridge vent
along center of
roof cover.

Open screen
along both sides
of ridge vent.

Access hatch on north side of roofing.

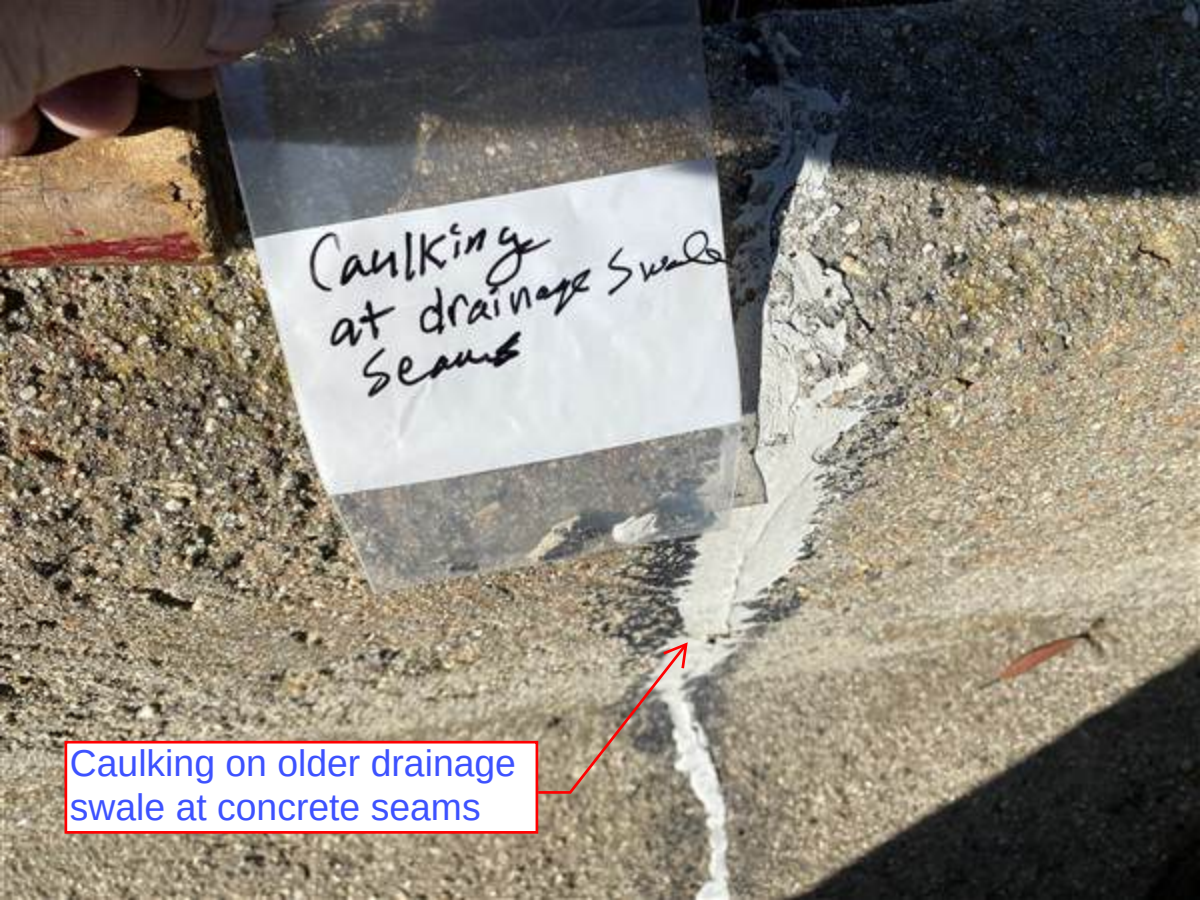
Stairs leading down into the reservoir from the hatch.

Caulking/mastics used to seal around raised edges and seams.

Silicon caulking found around roof fasteners.
3
Caulking on Rivets / Roof Fasteners

Typical construction using fasteners and caulking for roof assembly.

Newer concrete drainage channel on southwest side of reservoir.



Caulking on older drainage swale at concrete seams

Foam insulation on underside of ridge vent.

Caulking used to seal ridge vent seams.

Valve Building on north side of property near the main gate.
TRESPASSING LOITERING FORBIDDEN by LAW

Valve Building is a concrete structure with built-up roofing

Painted valves and piping near valve building. This was not sampled for lead or asbestos.

Surge tank and piping on south side of valve building. No sampling was conducted due to access issues.

Subject: **Site Assessment Report**
Vic Trace Reservoir
740 Dolores Drive
Santa Barbara, CA 93109
APN# 035-033-031
EH-CMP-23-00106
GeoTracker Global ID# T1000002136

Dear Mr. Ward:

The Santa Barbara County Public Health Department, Environmental Health Services Division (EHS) has reviewed the July 26, 2023 document prepared by Rincon Consultants, Inc. titled *Data Summary Submittal - Environmental Site Investigation for the Vic Trace Reservoir Replacement Project, 740 Dolores Drive, Santa Barbara, California 93109 (Summary).*

The Vic Trace Reservoir was constructed in 1956 and consists of a partially buried rectangular concrete tank. The Vic Trace Reservoir Replacement Project (Project) will replace the existing 10-million-gallon drinking water storage tank with possibly two 5-million-gallon buried concrete tanks. The site is located within the boundaries of the abandoned Mesa Oil Field. Prior to the construction of the Vic Trace Reservoir, the Dralock Oil Company Beckstead #1 Oil Well (API 0408303644) was drilled within the site boundaries in August to September 1935 to a total depth of 1,578 feet below grade (bgs). According to historical records, no oil or gas showings were encountered, and the well was abandoned on September 14, 1935. The dry hole was filled with heavy mud from total depth to 134 feet bgs. A wooden plug was driven to 136 feet bgs and cement was added to a depth of 75 feet bgs.

Aerial photographs from 1928 through 2020 were reviewed and the historical oil well and drilling sump features associated with the Beckstead #1 Oil Well were identified in the

1938, 1943, 1947, and 1954 photographs. After georeferencing the site features, it appeared that abandoned oil well and associated sump features were located beneath the Vic Trace Reservoir.

The initial phase of work focused on evaluating lead in soil around the reservoir and Asbestos Containing Material (ACM) and Lead Based Paint (LBP) (or lead components) in the site building materials. Shallow soil samples were collected from a depth of approximately 0.5 feet bgs along the perimeter of the Vic Trace Reservoir in order to evaluate the shallow soil for potential lead impacts associated with LBP from the site structures. Twenty-five shallow soil samples were collected and analyzed for Total Lead using USEPA Method 6010B. Additionally, a hazardous materials survey was conducted in order to identify the presence of ACM and LBP prior to demolition activities. The ACM survey was conducted by a California Division of Occupation Safety and Health Certified Asbestos Consultant/Site Surveillance Technician. A total of 23 bulk samples were collected from representative suspect ACMs and submitted for analysis by Polarized Light Microscopy. The LBP survey was conducted by a State of California Department of Public Health Services Certified Lead Inspector/Risk Assessor for LBP. Painted surfaces were Screened for LBP using an X-Ray Fluorescence (XRF) paint analyzer. Three bulk samples were analyzed for lead via EPA Method 3050B/7000B.

The results of the investigation were documented in the *Summary*. Lead was detected in each of the soil samples at concentrations ranging from 5.01 to 19.4 mg/kg. These results are below the Tier 1 Environmental Screening Level (ESL) of 32 mg/kg. Asbestos was not detected in any of the 23 bulk samples. Lead in the bulk paint samples ranged from 12-30 mg/kg. Based upon these results, the *Summary* concluded the following:

- The results of the soil sampling indicate that no mitigation measures, or special handling or management for lead impacted shallow soils is required along the perimeters of the reservoir or valve building; and .
- The results of the hazardous building materials survey conducted for the reservoir and valve building indicate that no special handling is required for future demolition of the site building materials that were tested. Materials tested as a part of this survey may be disposed of as regular construction waste. Additional sampling or inspection of the valve building interior may be required should this structure be demolished or renovated.

After careful review of the *Summary* and site file, EHS has the following comments:

1. EHS concurs that analytical results indicate that lead in the soil samples are below screening levels and that no mitigation of this soil is warranted, at this time.

2. EHS does not provide oversight for sampling/remediation of ACM and LBP in building materials. EHS recommends contacting the appropriate State or local agency for further concurrence on these results.

3. Based upon the soil results, EHS will not require enrollment in our Site Mitigation Unit Program, at this time. Additional sampling was proposed in the July 26, 2023

Workplan. EHS may require regulatory oversight based upon those results, when available.

If you have any questions regarding the aforementioned, please do not hesitate to call me at (805) 346-8216. Written correspondence regarding this matter should be sent to EHS at 2125 S. Centerpointe Parkway, Suite 333, Santa Maria, CA 93455, via facsimile to (805) 346-8485, or email toTRejzek@sbcphd.org.

Sincerely,

Thomas M. Rejzek

Senior Project Engineer
City of Santa Barbara Public Works
Via email: kbourque@SantaBarbaraCA.gov

Subject: Data Summary Submittal – Hazardous Materials Survey for the Vic Trace Reservoir Replacement Project, 740 Dolores Drive, Santa Barbara, California 93109

Dear Ms. Bourque:

Rincon Consultants, Inc. (Rincon) has prepared this Data Summary Submittal for the Hazardous Materials Survey for the Vic Trace Reservoir Replacement Project (project), located at 740 Dolores Drive, Santa Barbara, California (site; Figure 1). The purpose of the data summary is to report the results of the hazardous building materials survey conducted at the site.

Background

Rincon previously oversaw a hazardous building materials survey of the reservoir and valve building on October 16, 2023. Due to access limitations, the interior of the valve building was not surveyed, and neither the interior or exterior of the IT building was surveyed. The findings of the 2023 survey were provided to both the City and County Environmental Health Services Division in a report, dated November 13, 2023.

Hazardous Building Materials Survey

On February 28, 2026, Insight Environmental Inc. (Insight) was subcontracted to perform the hazardous building materials survey. The Asbestos and Lead Report prepared by Insight is provided in Attachment 1.

The following services were conducted to define potential asbestos and lead concerns at the site by Insight:

- A visual inspection of representative building materials was conducted to identify suspect asbestos and lead paint or other lead materials;
- The asbestos containing building materials (ACM) surveys were conducted by a California Division of Occupation Safety and Health Certified Asbestos Consultant/Site Surveillance Technician and the lead-based paint (LBP) surveys were conducted by a State of California Department of Public Health Services Certified Lead Inspector/Risk Assessor for LBP;
- A total of 25 bulk samples were collected from representative suspect ACMs for submittal to a qualified laboratory for asbestos analysis; and,
- Screening for lead-based paint was conducted using an X-Ray Fluorescence (XRF) paint analyzer to screen representative surfaces and materials suspected of being coated with lead-based paint.

Laboratory Analysis

The ACM bulk samples were collected from representative suspect materials and sent to LA Testing for analysis by Polarized Light Microscopy (PLM) using EPA Method 600/R- 93-116.

Results

Asbestos

Based on laboratory analytical results and visual observations, asbestos was not detected above the detection limit in any of the suspect building materials sampled as part of Insight's survey. Based on these findings, no ACMs were identified at the site.

Lead

The light green paint located in the interior of the valve building was identified as lead-based paint with concentrations of 1.6 milligrams per square centimeter (mg/cm^2) and 11.9 mg/cm^2. In Santa Barbara County, an action level of 1.0 mg/cm^2 has been established. If disturbance of these painted areas are anticipated, they should be removed by a licensed abatement company and disposed of in accordance with all Local, State and Federal regulations.

Conclusions and Recommendations

The results of the hazardous building materials survey conducted for the valve and IT buildings indicate that lead-based paint was identified within the interior of the valve building at concentrations of 1.6 mg/cm^2 and 11.9 mg/cm^2. In Santa Barbara County, an action level of 1.0 mg/cm^2 has been established. If disturbance of these painted areas is anticipated, they should be removed by a licensed abatement company and disposed of in accordance with all Local, State and Federal regulations.

The hazardous building materials survey was limited to readily accessible areas. There is potential that suspect materials previously not included or identified by Insight's survey could be discovered during site work. This may include suspect materials located inside the parts of the reservoir underwater or not accessible during Insight's inspection. If suspect materials are found during site demolition or renovation work, the area should be isolated, and any suspect materials tested to confirm or deny the presence of asbestos, lead, or other hazards.

Sincerely,
Rincon Consultants, Inc.

This document has been digitally signed and sealed by Andy Nelson, PG on March 2, 2026.

Andy Nelson, PG
Director of Assessment and Remediation

LIMITED ASBESTOS & LEAD BASED PAINT SURVEY

DATE: **February 28, 2026**

ATTENTION: **Rincon Consultants**

SUBJECT PROPERTY: **Vic Trace Reservoir, Santa Barbara, California**

INTRODUCTION:

On February 25, 2026, Insight Environmental, Inc. performed a Limited Asbestos and Lead-Based Paint Survey at the subject property. The purpose of this survey was to determine the presence or absence of asbestos containing materials and lead-based paint in the proposed work areas of the property prior to the disturbance of building materials. This Survey was limited to the accessible building materials within the work areas identified by the client. This survey was conducted by Alan Munoz (CSST #25-7938) under the supervision of Benjamin Blaker (CAC #15-5563) and Jason Woodward (CDPH Inspector/Assessor # 00008979).

ASBESTOS GUIDELINES

According to standards established by the Environmental Protection Agency (EPA), any material that contains greater than 1% of asbestos is considered to be an Asbestos Containing Material (ACM), and is subject to regulatory provisions under 40 CFR 61.

Materials containing greater than one tenth of one percent (>0.1%) and less than one percent are considered Asbestos Containing Construction Materials (ACCM) according to Cal-OSHA. These materials are subject to regulatory provisions under the California Code of Regulations (CCR), Title 8; Section 1529.

All material samples were forwarded to EMSL Analytical, Inc., (NVLAP #101048-0 and Cal ELAP #1877). See attached laboratory report for details.

LEAD GUIDELINES:

The Department of Housing and Urban Development (HUD) Guidelines and the EPA's Renovation, Repair, and Paint Rule consider lead levels of 0.5 percent lead by weight (5000 parts per million (ppm) or mg/kg) or greater; alternatively, an action level of 1 milligram per square centimeter or greater, as lead-based paint which may be a potential hazard. **In Santa Barbara County, an action level of 1.0 milligrams per square centimeter has been established.** In 1978, the Consumer Product Safety Commission (CPSC) banned lead-containing paint containing greater than 0.06% (600 ppm) lead in residential paint.

ASBESTOS SAMPLING SUMMARY

Non-Asbestos Containing Materials: According to independent laboratory analysis, no asbestos was detected in the following sampled materials:

- The ceiling tile sampled(12x12) at three locations.
- The seam mastic sampled at three locations (HVAC Ducting) in the IT building.
- The roof penetration mastic sampled at two locations.
- The rolled comp. materials sampled at three locations.
- The brick and mortar materials sampled at three locations.
- The concrete foundation/slab materials sampled in nine locations.

LEAD SAMPLING SUMMARY

The following surfaces were sampled and/or considered to be coated with lead-based paint or glazing (greater than 1.0 milligrams per square centimeter):

- Metal valve located in the interior of the valve building (light green)
- Metal beam located in the interior of the valve building (light green)

Lead analysis was conducted using a Huerisis PB 200i Paint Analyzer (Serial Q5-553). See the attached XL spread sheet for the surfaces tested.

RECOMMENDATIONS:

Insight Environmental, Inc. recommends the above referenced Lead-based painted/glazed components be removed, if disturbance is anticipated, by a licensed abatement company. Lead-based/coated components should be disposed of in accordance with all Local, State and Federal regulations.

If during the course of renovation/demolition, any other suspect materials are discovered, Insight Environmental, Inc. should be contacted for further testing and recommendations.

LIMITATIONS:

The findings set forth in this survey are strictly limited to the time, date, and the scope of the evaluation. Insight Environmental, Inc. does not guarantee that all asbestos or lead will be removed or that asbestos materials in concealed locations have been discovered or disclosed.

Test Report: Asbestos Analysis of Bulk Materials via AHERA Method 40CFR 763 Subpart E Appendix E supplemented with EPA 600/R-93/116 using Polarized Light Microscopy

			Non-Asbestos		Asbestos
Sample	**Description**	**Appearance**	**% Fibrous**	**% Non-Fibrous**	**% Type**
13 322605045-0013	Interior Ceiling (IT Building) - Ceiling Tile	Gray/White Fibrous Heterogeneous	40% Cellulose 20% Min. Wool	20% Perlite 20% Non-fibrous (Other)	None Detected
14 322605045-0014	Interior Ceiling (IT Building) - Ceiling Tile	Gray/White Fibrous Heterogeneous	40% Cellulose	20% Mica 20% Perlite 20% Non-fibrous (Other)	None Detected
15 322605045-0015	Interior Ceiling (IT Building) - Ceiling Tile	Brown/White Fibrous Heterogeneous	40% Cellulose 20% Min. Wool	20% Perlite 20% Non-fibrous (Other)	None Detected
16 322605045-0016	Interior Ceiling (IT Building) - Ceiling Tile 12x12	Brown/White Fibrous Heterogeneous	60% Cellulose	20% Perlite 20% Non-fibrous (Other)	None Detected
17 322605045-0017	Interior Ceiling (IT Building) - Ceiling Tile 12x12	Brown/White Fibrous Heterogeneous	60% Cellulose	20% Perlite 20% Non-fibrous (Other)	None Detected
18 322605045-0018	Interior Ceiling (IT Building) - Ceiling Tile 12x12	Brown/White Fibrous Homogeneous	60% Cellulose	20% Perlite 20% Non-fibrous (Other)	None Detected
19 322605045-0019	HVAC Duct Interior (IT Building) - Seam Mastic	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
20 322605045-0020	HVAC Duct Interior (IT Building) - Seam Mastic	Gray/Beige Fibrous Heterogeneous		100% Non-fibrous (Other)	None Detected
21 322605045-0021	Exterior Roof (IT Building) - Rolled Comp.	Gray/White/Beige Fibrous Heterogeneous	15% Glass	85% Non-fibrous (Other)	None Detected
22 322605045-0022	Exterior Roof (IT Building) - Rolled Comp.	Gray/Beige Non-Fibrous Homogeneous	5% Glass	95% Non-fibrous (Other)	None Detected
23 322605045-0023	Exterior Roof (IT Building) - Rolled Comp.	Gray/Beige Non-Fibrous Homogeneous	3% Glass	97% Non-fibrous (Other)	None Detected
24 322605045-0024	Exterior Roof (IT Building) - Pen. Mastic	Tan Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
25 322605045-0025	Exterior Roof (IT Building) - Pen. Mastic	Tan Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected

LA Testing maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by LA Testing. LA Testing bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore LA Testing recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by LA Testing South Pasadena, CA NVLAP Lab Code 200232-0, CA ELAP 2283

Steve Rogers Acoustics

Vic Trace Reservoir Replacement
Santa Barbara, CA

New Pump/Valve Building & Emergency Generators
DRAFT Noise Impact Analysis & Recommendations

September 30, 2025

Prepared for:

Kennedy Jenks
275 Battery Street, Suite 550
San Francisco, CA 94111

By:

Steve Rogers Acoustics, LLC

Steve Rogers
Principal

1. Background & Context

a) The project is replacement of an existing building on the Vic Trace Reservoir site in Santa Barbara, CA with a new pump/valve building to be known as La Coronilla Pump Station and Valve Building.

b) The project also includes a new IT building and two emergency diesel generators – one engine to serve the pump/valve building and one to serve the IT building.

c) Existing ambient noise levels are mostly due to nearby and distant surface street traffic. To establish baseline ambient noise levels, we monitored noise for a continuous 24-hour period between August 26 and 27, 2025 at a location selected to represent conditions at the closest residential uses – as shown in Figure 1.

Figure 1: Site vicinity plan showing location of ambient noise monitors

d) Data collected by the noise monitor is presented as an hourly, A-weighted Equivalent Sound Pressure Level graph in Figure 2. The measured noise levels equate to a Day-Night noise level (Ldn) of 47.7. The noisiest hour was found to be 4 – 5 PM, when the measured ambient noise level was 49.0 dBA.

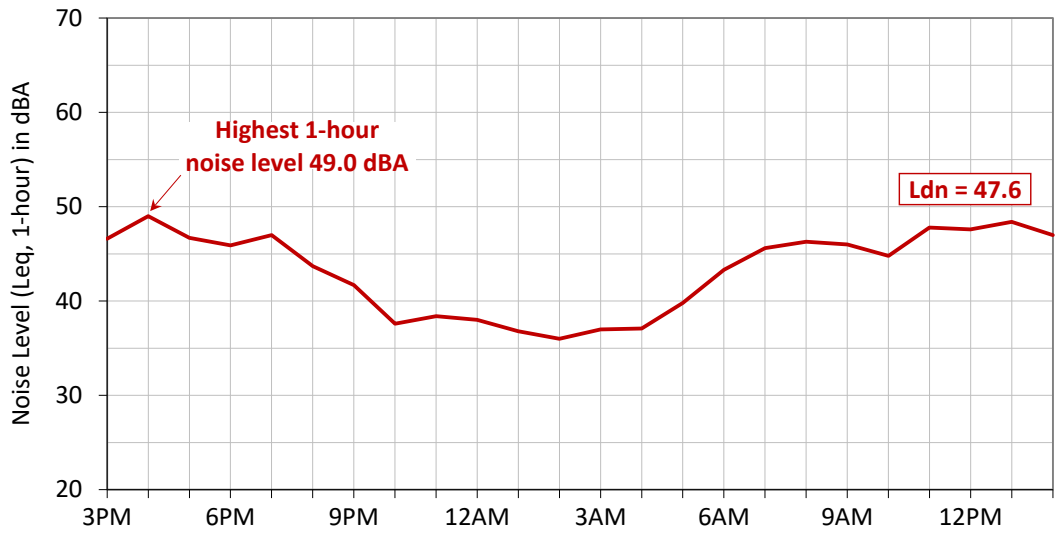
2. Applicable Noise Regulations

a) <u>City of Santa Barbara Municipal Code</u>

Noise in the City of Santa Barbara is regulated by Chapter 9.16 of the Municipal Code, also known as the City of Santa Barbara Noise Ordinance. According to SBMC 9.16.070.D:

> *Noise limitations. All mechanical equipment other than vehicles (including heating, ventilation, and air conditioning systems) shall be insulated. Sound at the property line of any adjacent parcel used or zoned for residential, public, or semi-public uses shall not exceed 53 A-weighted decibels 53dB(A). All wind machines are prohibited in the City.*

Figure 2: Ambient Noise Monitoring Results



b) City of Santa Barbara General Plan

The City of Santa Barbara General Plan establishes an outdoor noise level of 60 dBA Ldn as the acceptable limit for required outdoor living areas of residential units located within single-family zones except for areas subject to higher ambient noise levels, for which a 65 dBA Ldn is limit. Because the existing ambient Ldn at the homes adjacent to the Project site is less than 60 dBA, the 60 dBA Ldn noise limit applies.

c) Relationship Between Municipal Code and General Plan Noise Limits

Day-Night noise level is calculated by average noise levels received at a certain location over a 24-hour period with a 10 dBA penalty applied to nighttime noise levels (those received between 10 PM and 7 AM). A constant noise level of 53 dBA (the instantaneous noise limit in the SBMC) over a 24-hour period would equate to an Ldn of 59.4 dBA. It follows that, if the Project complies with the 53 dBA noise limit it will automatically comply with the Ldn 60 dBA limit.

So, for the purposes of this report, the noise limit for the project is considered to be 53 dBA at any neighboring property, at any time of day or night.

3. Current Design Proposals

a) Our noise evaluation is based on the information available to us about the design of the project as of the date of this report.

b) We understand that the new pump/valve building will house three new vertical turbine pumps, each rated at 60 HP and a 7.5 HP air compressor. These are the only noise sources we are aware of in the pump/valve building.

c) The architectural design of the pump/valve building is developing, with details of the various elements of the building envelope yet to be finalized. For the time being, we have based our calculations on the arrangements shown in a 3D rendering, dated March 2025 (which is reproduced as Figure 2 in this report), and assuming the following features:

- 8” CMU walls
- Sheet metal roof
- Windows in the east and west walls of single-pane glass
- Two hollow metal doors and one large rollup door in the north wall

Figure 2: 3D Rendering of the Pump/Valve Building (March 2025)

d) We understand that the emergency generators – one rated at 250 kW serving the pump/valve building and one rated at 50 kW serving the IT building – will be located on a concrete pad behind (south of) the pump/valve building. The current basis of design for the generators is Caterpillar, with each one packaged in Caterpillar’s “Level 2” sound attenuating enclosure.

4. Noise Analysis

a) SoundPLAN Model

The noise impact of the project has been analyzed using SoundPLAN software to create a scale 3D computer model of the project site and its surroundings, including the topography of the area and presence of existing and future buildings.

b) Equipment as Currently Proposed

The various noise sources (six in all) have been input to the model based on manufacturers’ noise data provided for the equipment currently proposed for the project, as summarized in Table 1.

Table 1: Summary of 2 Available Equipment Noise Data

Equipment	Basis of Design	Number in model	Data Format (1)	dBA
60 HP Pumps	GE Induction Motor	3 (2)	Lw	81.9
7.5HP Air Compressor	Atlas Copco SF6	1 (2)	Lp at 1 meter	59.0
250 kW Generator	Caterpillar C09DE60	1 (3)	Lp at 23.0 feet	72.4
50 kW Generator	Caterpillar NAC304P	1 (3)	Lp at 23.0 feet	68.6

(1) Lw stands for Sound Power Level, Lp stands for Sound Pressure Level
(2) Equipment located inside the new pump/valve building
(3) Generators in Level 2 enclosure package including internal muffler

Noise contour maps calculated by the SoundPLAN model are provided in Appendix A. Map 1 shows contours for the currently proposed equipment selections – including the basis-of-design emergency generators with Level 2 noise attenuation. The noise contours are calculated for a receiver height of 5-feet above the ground. Table 2 summarizes predicted noise levels at seven specific receiver locations, selected to represent the homes closest to the project site.

Table 2: Noise Levels Received at Nearby Homes – Currently Proposed Equipment

Receiver Location		Predicted Project Noise Level (1) (dBA)	Ambient Noise Level (2) (dBA)	Total Noise Level (dBA)	Complies with 53 dBA Limit?
R1	Backyard of 826 Dolores	51.6	49.0	53.5	NO
R2	Backyard of 832 Dolores	47.3	49.0	51.2	YES
R3	Backyard of 1633 Coronilla	53.1	49.0	54.5	NO
R4	Front yard of 1624 Coronilla	52.7	49.0	54.2	NO
R5	Backyard of 1617 Coronilla	64.3	49.0	64.4	NO
R6	Backyard of 1607 Coronilla	52.7	49.0	59.0	NO
R7	Backyard of 1601 Coronilla	53.0	49.0	54.5	NO

(1) For receiver height of 5-feet above the ground
(2) Worst-case 1-hour noise level

As Table 1 shows, total noise levels predicted for the basis-of-design equipment scenario exceeds the 53 dBA noise limit at all but one of the homes closest to the project site.

c) Generators in Custom Sound Attenuating Enclosures

Noise contour Map 2 shows contours for a scenario where the current basis-of-design Caterpillar generators in Level 2 enclosures are replaced with generators in custom enclosures designed to reduce noise to the following levels:

250 kW Generator 58 dBA at 23-feet
50 kW Generator 54 dBA at 23-feet

Table 3 summarizes predicted noise levels at the homes closest to the project site for this scenario. In each case, the predicted noise level complies with the 53 dBA limit.

Table 3: Noise Levels Received at Nearby Homes – Currently Proposed Equipment

Receiver Location		Predicted Project Noise Level (1) (dBA)	Ambient Noise Level (2) (dBA)	Total Noise Level (dBA)	Complies with 53 dBA Limit?
R1	Backyard of 826 Dolores	37.2	49.0	49.3	YES
R2	Backyard of 832 Dolores	35.7	49.0	49.2	YES
R3	Backyard of 1633 Coronilla	39.5	49.0	49.5	YES
R4	Front yard of 1624 Coronilla	38.5	49.0	49.4	YES
R5	Backyard of 1617 Coronilla	49.9	49.0	52.5	YES
R6	Backyard of 1607 Coronilla	44.2	49.0	50.2	YES
R7	Backyard of 1601 Coronilla	38.6	49.0	49.4	YES

(1) For receiver height of 5-feet above the ground
(2) Worst-case 1-hour noise level

5. Conclusions & Recommendations

a) Our analysis shows that, with current equipment selections, the project will not meet the noise limit of 53 dBA at the surrounding residential properties.

b) In order to meet the 53 dBA noise limit at all homes closest to the project site, the two emergency generators should be housed in custom sound attenuating enclosures, specified to limit noise to:

58 dBA at a distance of 23-feet for the 250 kW generator

54 dBA at a distance of 23-feet for the 50 kW generator.

Oil-free scroll compressors

SF+ 1-6 (1.5-5.5 kW/2-7.5 hp)

SF+ 8-22 (7.4-22 kW/10-30 hp)

Optimize your system

Some applications may need or may benefit from additional features and more refined control/ air treatment systems. To meet these needs, Atlas Copco has developed optional parts and easily integrated compatible equipment.

SF+ 1-6

- CD adsorption dryer (only for FF TM variants)
- Phase Sequence Relay
- Prefiltration kit
- EQ4i central compressor control
- EQ6i central compressor control
- Integrated 30l air receiver + timer drain
- 270l air receiver
- 500l air receiver
- Timer drain on air receiver (only for tank-mounted variants)
- WSD water separator drain (only for Pack FM variants)

SF+ 8-22

	SF+ 8-11	SF+ 15-22
Extra module upgrade SF+ 8-15	•	-
EQ4i central compressor control	•	•
EQ6i central compressor control	•	•
Test report	•	•
Electronic water drain (Pack units only)	•	•
Main switch	•	•

• Optional
- Not available

AIRnet compressed air piping systems

The right piping system makes all the difference. AIRnet ensures that your compressed air reaches your point of use in optimal conditions:

- Complete system with pipes in different materials, fittings, and point-of-use accessories.
- Smooth air flow and stable pressure.
- High air quality thanks to non-corrosive materials.
- Turnkey, dynamic design with flexible, interchangeable, and reusable fittings.
- Fast installation and no maintenance needed.

Contact us today for more information about AIRnet. Our experts can help you size, plan and install your AIRnet system to ensure it supports your production with maximum energy efficiency and minimal total cost of ownership.

Technical specifications SF+ 1-6

TECHNICAL MEMORANDUM

To:	Amanda Antonelli, MESM Senior Environmental Planner	From:	Sean Daly, AICP, PTP SungWoo Jo, TE Iteris, Inc. 801 S Grand Ave, Suite 750 Los Angeles, CA 90017
Date:	August 19, 2025		
RE:	Vic Trace Reservoir – CEQA Construction Traffic Analysis		

INTRODUCTION

This memorandum documents the transportation impact analysis prepared for the Vic Trace Reservoir Parcel Improvements and Reservoir Replacement Project (referred to herein as "project"). The analysis is prepared consistent with the California Environmental Quality Act (CEQA) and the City of Santa Barbara Public Works Department Master Environmental Assessment (MEA) Guidelines for Transportation Analysis (December 2023). The analysis considers the screening criteria and the four environmental checklists as advised in MEA listed below:

Environmental Checklist Impact Criteria

T-1 *Would the project conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?*
T-2 *Would the project conflict with or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?*
T-3 *Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?*
T-4 *Would the project result in inadequate emergency access?*

Screening Criteria

Per the MEA Guidelines (p.3), projects are defined as "small projects" when generating 250 or fewer daily net vehicle trips on an average weekday. Those defined as "small projects" are presumed to have less than significant CEQA transportation impacts. As shown in **Table 1,** the project is anticipated to generate 36 trips, 236 trips, and 44 trips during the demolition phase, excavation phase, and construction phase, respectively. The project is not anticipated to generate more than 250 trips during any of the phases, and is defined as a "small project", which is presumed to have less than significant transportation impacts. Therefore, the project is exempt from detailed VMT analysis.

Table 1: Project Generate Trips by Project Phase

Phase	Heavy Vehicle Daily Trips (One-Way)	Passenger Vehicle Daily Trips (One-Way)	Total Daily Trips (One-Way)
Demolition	20	16	36

Excavation	220	16	236
Construction	28	16	44

Environmental Checklist Impact Criteria

While the screening criteria presumes the project to cause less than significant transportation impacts, and it is exempt from detailed VMT analysis, the impact criteria were briefly reviewed to evaluate the degree of potential temporary transportation impacts during the project.

Impact Criteria T-1

The project is a water infrastructure replacement project within the existing public right-of-way. The project does not consist of any modifications to the existing circulation network. The project would not be in conflict with any programs, plans, ordinances and policies addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities. Construction activities are temporary, and would also not result in any long term traffic demand. Therefore, the project impact would be **less-than-significant.**

Impact Criteria T-2

The project is screened as a "small project", and VMT analysis is not required as it is presumed that the project impact would be **less-than-significant**. This impact criterion evaluation is prepared to present the VMT generation per day and throughout the project duration by the project for informational purposes.

Based on the available information, demolition and other debris would likely be hauled to the South Coast Recycling & Transfer Station, which would direct trash to the Tajiguas Landfill, which translates to a 28.7-mile one-way trip from the project site. Thus, it is assumed that a heavy vehicle during the demolition phase would travel 57.4 miles per roundtrip, which equates to 580 daily VMT or 12,900 total VMT to complete the demolition phase. It is unclear how far construction vehicles would typically travel as construction materials can originate from various sources. According to California Emissions Estimator Model (April 2022), the default lengths of hauling trips are 20 miles each way. Thus, it is assumed that a heavy vehicle during the construction phase would travel 40 miles per roundtrip, which equates to 560 daily VMT or 57,600 total VMT to complete the construction phase. Excavated soil can either be sent to landfill or be recycled at other sites. Thus, it is assumed that a heavy vehicle during the excavation phase would travel 48.7 miles per roundtrip, which is an average of demolition trip and construction trip. This equates to 5,360 daily VMT and 449,600 total VMT to complete the excavation phase. Finally, Understanding Regional Travel Patterns by Santa Barbara County Association of Governments (January 2024) presents that average commute distance for work trips originating in jurisdiction is 12.3 miles per commuter. This equates to 100 daily VMT or a total of 19,700 VMT during to complete every phase of the project.

Table 2: Heavy Vehicle and Passenger Vehicle VMT Generation by the Project

Mode	Phase	Daily VMT per Trip (Two-way)	Daily VMT	Total VMT (Phase Completion)

Heavy Vehicle	Demolition	57.4	580	12,900
	Excavation	48.7	5,360	449,600
	Construction	40.0	560	57,600
Passenger Vehicle	Every Phase	12.3	100	19,700

Impact Criteria T-3

The project is expected to occur within the existing public right-of-way, and no permanent changes to roadway geometry or design are proposed. The project would not substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment). Temporary lane closures and construction detours will be handled with a standard traffic control plans per the City requirements. Therefore, the project impact would be **less-than-significant.**

Impact Criteria T-4

The project may result in temporary lane closures during construction. However, access for emergency responders will be maintained at all times via a standard traffic control plan. It is also recommended to coordinate with the City Fire Department to ensure compliance with emergency access requirements during the project duration. Nevertheless, there would be no permanent restrictions to emergency access, and the project impact would be **less-than-significant.**

TECHNICAL MEMORANDUM

To:	Amanda Antonelli, MESM Senior Environmental Planner	From:	Sean Daly, AICP, PTP SungWoo Jo, TE Iteris, Inc. 801 S Grand Ave, Suite 750 Los Angeles, CA 90017
Date:	August 19, 2025		
RE:	[Vic Trace Reservoir] – Non-CEQA Construction Traffic Analysis		

This technical memorandum presents the traffic analysis results of construction activities at Vic Trace Reservoir project in the City of Santa Barbara (referred to herein as "project"), which will be impacting the local neighborhood in the project vicinity. The project is anticipated to be performed in three phases, which includes demolition phase, excavation phase, and construction phase. The main access points to the project will be at the Meigs Road/Carrillo Street/La Coronilla Drive intersection and the Megis Road/Dolores Drive intersection.

Data Collection

The traffic analysis was conducted for three (3) intersections in the vicinity of the project site:

1. Meigs Road/Carrillo Street/La Coronilla Drive (Two-way Stop Controlled Intersection);
2. Meigs Road/Dolores Drive (Two-way Stop Controlled Intersection); and,
3. Dolores Drive/la Coronilla Drive (Two-way Stop Controlled Intersection).

Intersection traffic operations were evaluated for each of the following scenarios during the weekday morning (7:00 AM – 9:00 AM) and evening (4:00 PM 6:00 PM) peak periods during weekday conditions:

- Existing Conditions – Traffic counts at study intersections were collected August 5th of 2025 on a typical weekday (Tuesday) during AM and PM peak periods. The collected traffic counts represent the existing conditions with no construction activities in presence. The heavy vehicle percentage along the residential streets (La Coronilla Drive and Dolores Drive) is assumed to be 0 percent, while along Meigs Road/Carrillo Street, it is assumed to be 2 percent based on the observation from historic counts available at the West Carrilo Street/Chino Street intersection, which is north of the study area.
- Demolition Phase – Five-week long phase with a total of 224 two-way truck trips or up to 10 two-way truck trips per day. The phase also includes 8 two-way worker trips (passenger vehicle) per day.
- Excavation Phase – Four-month long phase with a total of 9,230 two-way truck trips or up to 110 two-way truck trips per day. The phase also includes 8 two-way worker trips (passenger vehicle) per day.
- Construction Phase – 100-working-day long phase with a total of 1,440 two-way truck trips or 14 two-way truck trips per day. The phase also includes 8 two-way worker trips (passenger vehicle) per day.

All Heavy vehicles are assumed to travel to and from the construction site across every phase using the following route:

- La Coronilla Drive <-> Carrillo Street <-> US-101: This represents the shortest route between the project site and US-101 to ensure the lowest exposure of heavy vehicles to the local roadway network. Passenger vehicles of the workers are assumed to take two routes

Passenger vehicles of the workers are assumed to take two separate routes:

- La Coronilla Drive <-> Carrillo Street <-> US-101: 2/3 of the workers are assumed to travel via this route.
- La Coronilla Drive <-> Dolores Drive <-> Meigs Road <-> Cliff Drive <-> US-101: 1/3 of the workers are assumed to travel via this route.

Table 1 summarizes the Trip distribution for each route for each mode.

Table 1: Project Trip Distribution for each Route for each Mode

Mode	Duration	Total Trips
Heavy Vehicle – Route 1	La Coronilla Dr -> Carrillo St -> US-101	100%
	Heavy Vehicle Total	**100%**
Workers – Route 1	La Coronilla Dr -> Carrillo St -> US-101	66%
Workers – Route 2	La Coronilla Dr -> Dolores Dr -> Meigs Rd -> Cliff Dr -> US-101	34%
	Workers (Passenger Vehicle) Total	**100%**

Based on the available information, the AM peak hour is proposed to represent 20 percent of daily inbound and 10 percent of daily outbound heavy vehicle traffic for every phase; the PM peak hour is proposed to represent 0 percent of daily inbound and 20 percent of daily outbound heavy vehicle traffic for every phase. All workers (passenger vehicles) are assumed to enter during the AM peak hour, and exit during the PM peak hour. **Table 2** summarizes the number of heavy vehicles and passenger vehicles assumed for each phase during each peak hour.

Table 2: Project Directional (Inbound/Outbound) Trip Distribution by Project Phase

Mode	Phase	Duration	Total Trips (Two-Way)	Daily Trips (Two-Way)	AM Peak Hour INBOUND	AM Peak Hour OUTBOUND	PM Peak Hour INBOUND	PM Peak Hour OUTBOUND
Heavy Vehicle	Demolition	5 Weeks	224	10	2	1	0	2
	Excavation	4 Months	9230	110	22	11	0	22
	Construction	100 Days	1440	14	3	2	0	3
Peak Hour % vs Daily- Heavy Vehicle					**20%**	**10%**	**0%**	**20%**
Auto	Workers*	200 Days	1600	8	8	0	0	8
Peak Hour % vs Daily - Worker					**100%**	**0%**	**0%**	**100%**

** Workers - assumed 8 daily two-way trips for every phase*

LOS Results

The quality of traffic operations is characterized using the concept of level of service (LOS). Level of service is defined by a range of grades from A (best) to F (worst). At intersections, LOS "A" represents relatively free flow operating conditions with little or no delay. LOS "F" is characterized by extremely unstable flow conditions, severe congestion, and delays with traffic volumes at or near the intersection's design capacity. This typically results in long vehicular queues extending from all approaches of an intersection.

LOS analysis is performed using the Highway Capacity Manual (HCM) 6th Edition methodology, which uses vehicular delay criteria to determine LOS. The LOS was calculated by utilizing Synchro 11 software. For two-way-stop-controlled (TWSC) intersections, the worst control delay from the minor street approaches are reported. For the purpose of this study, delays of permissive turning movements (i.e., southbound left-turning movement when northbound and southbound approaches are major street approaches) in addition to the minor street approach are reported. **Table 3** presents a brief description of each level of service letter grade and vehicle delay threshold for TWSC intersections.

Table 3: Intersection Level of Service Definitions – HCM Methodology

Level of Service	Description	HCM Average Delay (sec) – Stop Controlled Intersections
A	Free Flow	≤ 10
B	Reasonably Free Flow	>10 - 15
C	Stable Flow	>15 - 25
D	Approaching Unstable Flow	>25 - 35
E	Unstable Flow and Operation at Capacity	>35 - 50
F	Forced Flow and Overcapacity	>50

Existing Conditions

Table 4 presents the existing conditions levels of service at the study intersections during the AM and PM peak hours. All study intersections are TWSC, and the minor street approach delays and major street permissive left-turning delays are presented. As shown, all approaches and movements are currently operating at LOS C or better in the study area.

Table 4: Existing Conditions – AM and PM Peak Hour Level of Service

#	Intersection	Movement	Existing Conditions			
			AM Peak Hour		PM Peak Hour	
			Delay (s)	LOS	Delay (s)	LOS
01	Meigs Rd/Carrillo St/La Coronilla Dr	WB*	11	B	11.1	B
		SBL	8.2	A	8.4	A
02	Meigs Rd/Dolores Dr	WB*	14.4	B	19.1	C
		SBL	8	A	8.5	A
03	Dolores Dr/La Coronilla Dr	NB*	8.8	A	8.5	A
		WBL	7.3	A	7.3	A

** Minor Street Approach*

Demolition Phase

Table 5 presents the demolition phase levels of services at the study intersections during the AM and PM peak hours, and a comparison of delays to those of the existing conditions. As shown, all approaches and movements are anticipated to operate at LOS C or better during both AM and PM peak hours, and there would be no degrading of LOS as the impacted turning movements or approaches are only anticipated to increase marginal increases in delays of 0.3 seconds or less.

Table 5: Demolition Phase – AM and PM Peak Hour Level of Service

#	Intersection	Move-ment	Demolition Phase					
			AM Peak Hour			PM Peak Hour		
			Delay (s)	LOS	vs. Ex (s)	Delay (s)	LOS	vs. Ex (s)
01	Meigs Rd/Carrillo St/La Coronilla Dr	WB*	11.1	B	+0.1	11.4	B	+0.3
		SBL	8.2	A	0.0	8.4	A	0.0
02	Meigs Rd/Dolores Dr	WB*	14.5	B	+0.1	19.4	C	+0.3
		SBL	8.0	A	0.0	8.5	A	0.0
03	Dolores Dr/La Coronilla Dr	NB*	8.9	A	+0.1	8.5	A	0.0
		WBL	7.3	A	0.0	7.3	A	0.0

** Minor Street Approach*

Excavation Phase

Table 6 presents the excavation phase levels of services at the study intersections during the AM and PM peak hours, and a comparison of delays to those of the existing conditions. As shown, all approaches and movements are anticipated to operate at LOS C or better during both AM and PM peak hours, and there would be no degrading of LOS as the impacted turning movements or approaches are only anticipated to increase marginal increases in delays of 1.4 seconds or less. The most impacted approach is anticipated to be the westbound stop-controlled approach at the Meigs Road/Carillo Street/La Coronilla Drive intersection, which would increase in delay by 0.6 seconds during the AM peak hour and 1.4 seconds during the PM peak hour, but continue to operate at LOS B during both peak hours.

Table 6: Excavation Phase – AM and PM Peak Hour Level of Service

#	Intersection	Move-ment	Demolition Phase					
			AM Peak Hour			PM Peak Hour		
			Delay (s)	LOS	vs. Ex (s)	Delay (s)	LOS	vs. Ex (s)
01	Meigs Rd/Carrillo St/La Coronilla Dr	WB*	11.6	B	+0.6	12.5	B	+1.4
		SBL	8.4	A	+0.2	8.4	A	0.0
02	Meigs Rd/Dolores Dr	WB*	14.5	B	+0.1	19.4	C	+0.3
		SBL	8.0	A	0.0	8.5	A	0.0
03	Dolores Dr/La Coronilla Dr	NB*	9.1	A	+0.3	8.6	A	+0.1
		WBL	7.6	A	+0.3	7.7	A	+0.4

** Minor Street Approach*

Construction Phase

Table 7 presents the construction phase levels of services at the study intersections during the AM and PM peak hours, and a comparison of delays to those of the existing conditions. As shown, all approaches and movements are anticipated to operate at LOS C or better during both AM and PM peak hours, and there would be no degrading of LOS as the impacted turning movements or approaches are only anticipated to increase marginal increases in delays of 0.3 seconds or less.

Table 7: Construction Phase – AM and PM Peak Hour Level of Service

#	Intersection	Move-ment	Demolition Phase					
			AM Peak Hour			PM Peak Hour		
			Delay (s)	LOS	vs. Ex (s)	Delay (s)	LOS	vs. Ex (s)
01	Meigs Rd/Carrillo St/La Coronilla Dr	WB*	11.1	B	+0.1	11.4	B	+0.3
		SBL	8.2	A	0.0	8.4	A	0.0
02	Meigs Rd/Dolores Dr	WB*	14.5	B	+0.1	19.4	C	+0.3
		SBL	8.0	A	0.0	8.5	A	0.0
03	Dolores Dr/La Coronilla Dr	NB*	8.9	A	+0.1	8.5	A	0.0
		WBL	7.4	A	+0.1	7.4	A	+0.1

** Minor Street Approach*

Conclusions

Traffic analysis of the existing conditions and each of the project phases (demolition, excavation, and construction) based on the provided information shows that turning movements and approaches at all study intersections would operate at LOS C or better during both AM and PM peak hours. Thus, the project would have a minimal impact on traffic operations and access to residential neighborhoods in the study area.
