Responsibility of Water Supplier

The water supplier has the responsibility to maintain their public water system in compliance with all federal and state drinking water standards. Since cross-connection can cause contamination of the public water supply, water suppliers should have a cross-connection program in place.

The program should include an ordinance or rules of service to give the water supplier the authority to implement the cross-connection control program. Under the cross-connection regulations or rules of most states and territories the water supplier has the primary responsibility to prevent unapproved water sources, or any other substance, from entering the public water supply system. The water supplier is prohibited by these regulations or rules from installing or maintaining a water service connection to a consumer’s water system within its jurisdiction where a health system, plumbing or pollutional hazard exists, or will probably exist, unless the public potable water supply is protected against backflow by an approved backflow prevention assembly(s) installed at the service connection(s), i.e. point of delivery.

The water supplier’s responsibility begins at the source and includes all of the public water distribution system, including the service connection and the ends at the point of delivery to the consumer’s water system(s). In addition, the water supplier must exercise reasonable vigilance to ensure that the consumer has taken the proper steps to protect the public potable water system. To ensure that the proper precautions are taken the water supplier is required to determine the degree of hazard to the public potable water system. When it is determined that a backflow prevention assembly is required for the protection of the public system the water supplier shall require the consumer, at the consumer’s expense, to install an approved backflow prevention assembly at each service connection, to test immediately upon installation, relocation and annually or more often, to properly repair and maintain such assembly or assemblies and to keep adequate records of each field test and subsequent maintenance and repair, including materials or replacement parts.

§7584. Responsibility and scope of program.
The water supplier shall protect the public water supply from contamination by implementation of a cross-connection control program. The program, or any portion thereof, may be implemented directly by the water supplier or by means of a contract with the local health agency, or with another agency approved by the health agency. The water supplier’s cross-connection control program shall for the purpose of addressing the requirements of Sections §7585 through §7605 include, but not be limited to, the following elements:

(a) The adoption of operating rules or ordinances to implement the cross-connection program,

(b) The conducting of surveys to identify water user premises where cross-connections are likely to occur,

(c) The provision of backflow protection by the water user at the user’s connection or within the user’s premises or both,

(d) The provision of at least one person trained in cross-connection control to carry out the cross-connection program,

(e) The establishment of a procedure or system for testing backflow preventers, and

(f) The maintenance of records of locations, test and repairs of backflow preventers.

**Backflow Prevention Assembly**

Most Frequently Asked Questions:

Q. What is a backflow?
A. Backflow is back-pressure and/or back-siphonage;
   - **Back-Pressure:** Any elevation of pressure in downstream piping system by that could cause reversal of flow – i.e. pump, elevation, and steam or air pressure.
   - **Back-Siphonage:** A form of backflow due to a reduction in system pressure, which causes sub-atmospheric pressure to exist in the water system – i.e. water main break, damaged fire hydrant, meter shut off.

Q. What is a cross-connection?
A. A cross-connection is a direct or indirect arrangement of piping that allows the potable water supply to be connected to a contaminated source.
   - **For example:** water service supplying water to a building that also serves the irrigation system. Most common cross-connection is a garden hose submerged, or attached to contaminated fluids and undesirable substances.

Q. What is a Backflow Prevention Assembly?
A. A Backflow Prevention Assembly is a plumbing device that is most commonly installed between the water meter and the service main to the property.

Q. Why are they installed?
A. They are installed to protect the public & private drinking water supplies from cross-connections. These are plumbing requirements at the Federal, State and Local jurisdictions.

Q. What does a backflow preventer do?
A. Properly functioning backflow preventer only allows water to flow in one direction.
   - **For example:** The direction of flow would be through the water meter to the property. Never allowing the water to reverse back through the water meter, into public drinking water supply.

Q. Where is the backflow preventer located?
A. The preventer is normally located as close as practical to the service connection from your water supply. Commonly found behind the water meter.

Q. Why does a backflow preventer have to be tested?
A. The backflow preventer is a mechanical device with internal components such as check valves, seals, springs and rubber materials. These parts are subject to wear, fatigue and fouling. This is why backflow preventers are tested annually to ensure that they are functioning properly.

Q. How often do the backflow preventers need to be tested?
A. Title 17 of the California Health & Safety Code states that backflow preventers must be tested annually.

Q. What happens if the backflow preventer fails the initial test?
A. Repairs are necessary to pass the backflow preventer. In most cases, simply a cleaning and service corrects the problem. Repair parts are available if needed. Retest is performed to ensure the repairs have corrected the problem, and pass the backflow preventer.
Santa Barbara Municipal Code Chapter 14.20
WATER REGULATIONS

14.20.120 Check Valves and Anti-Backflow Devices.

Whenever the Director shall consider it necessary for the safety of the water system to have an approved check valve or anti-backflow device placed on the property side of any consumer's service, such device shall thereupon be immediately installed at the expense of such consumer. If such device is not installed within ten (10) days after the Director shall order such installation, it shall be installed by the Public Works Department at such consumer's expense on the basis of cost, plus overhead. (Ord. 2931 §2(part), 1963; prior Code §44.48.)

Title 17 §7605 California Code of Regulations
TESTING AND MAINTENANCE OF BACKFLOW PREVENTERS.

(a) The water supplier shall assure that adequate maintenance and periodic testing are provided by the water user to ensure their proper operation.

(b) Backflow preventers shall be tested by persons who have demonstrated their competency in testing of these devices to the water supplier or health agency.

(c) Backflow preventers shall be tested at least annually or more frequently if determined to be necessary by the health agency or water supplier. When devices are found to be defective, they shall be repaired or replaced in accordance with the provisions of this Chapter.

(d) Backflow preventers shall be tested immediately after they are installed, relocated or repaired and not placed in service unless they are functioning as required.

(e) The water supplier shall notify the water user when testing of backflow preventers is needed. The notice shall contain the date when the test must be completed.

(f) Reports of testing and maintenance shall be maintained by the water supplier for a minimum of three years.

Uniform Plumbing Code 2012
§603.4 WATER SUPPLY AND DISTRIBUTION – GENERAL REQUIREMENTS.

Assemblies shall comply with listed standards and be acceptable to the Authority Having Jurisdiction, with jurisdiction over the selection and installation of backflow prevention assemblies. The Premise owner or responsible person shall have the backflow prevention assembly tested by a certified backflow assembly tester at the time of installation, repair, or relocation and not less than on an annual schedule thereafter, or more often where required by the Authority Having Jurisdiction.

### Definitions:

- **Pollutant**: any hazard that affects aesthetics of water – taste, odor, color, smell but will not make you sick – i.e. stale water, beer, sugar, coffee, salty water, baptismal fountains.

- **Contaminant**: any hazard that could cause illness or death – i.e. chemical, pesticide, biohazard, gasoline, excessive nitrate, carbonated copper (potential toxic byproduct from soda machine backflow).

- **Back-Pressure**: Any elevation of pressure in downstream piping system by that could cause reversal of flow – i.e. pump, elevation, and steam or air pressure.

- **Back-Siphonage**: A form of backflow due to a reduction in system pressure, which causes sub-atmospheric pressure to exist in the water system – i.e. water main break, damaged fire hydrant, meter shut off.

Reduced Pressure Principle Assembly

1. The assembly shall be installed in a horizontal position with a minimum clearance of 16 inches and maximum of 36 inches between the relief valve discharge port and floor or grade, and a minimum of 16 inches of horizontal clearances of the relief valve.

2. A Reduced Pressure Assembly shall not be installed in a pit. Flooding of the pit can result in cross connection.

3. Proper installation of the assembly is essential to the protection of the water supply. The following are important characteristics of a proper installation:

4. The assembly must be purchased and installed with resilient seat valves as approved by the University of California Foundation for Cross-Connection Control and Hydraulic Research (U.C. Foundation).

5. Since the reduced pressure assembly is designed to be serviced while in line, the unit need not be removed and assembled.

6. Ensure the supply water pressure does not exceed the manufacturer's maximum water pressure rating of the assembly to avoid damage to the system or the assembly caused by system pressure.

7. Most field problems occur because dirt or debris present in the system at the time of installation becomes trapped in the first check seating area, resulting in continuous discharges from the relief valve in a bubble or liquid form.

8. In the water system continues to cause flooding, a strainer can be installed upstream of the assembly.

Backflow prevention assembly shall be lead free.

Detal W-12.0

NOTES
Refer to Uniform Plumbing Code (UPC) chapter 6, sections 603.00 thru 603.42 for more information.

All possible dedicated fire lines will be required to have double check detector device(s).

Situations should be eliminated to avoid possible damage to the system and device.

7. The device must be protected from freezing. Thermal water expansion and/or water hammer

cleaned.

5. After installation, all device and bleed air from unit until test to ensure proper operation. If either device fails

VALUE HANDHELD OR STEMS ALSO DO NOT SUPPORT DEVICE FROM ONLY ONE END.

4. The device shall only be installed per manufacturer's specifications.

3. Prior to installing in line, flush supply line of all foreign material. Failure to

2. Maintenance:

1. The double check valve assembly must be installed where it is accessible for periodic testing and

NOTES:
1. Notes:

2. AVB's shall not be subjected to any backpressure.

3. AVB's are for intermittent use only and shall not be pressurized for more than 12 hours in any 24-hour period.

4. AVB's shall not be installed where occasional dusty or corrosive conditions occur.

5. AVB's shall be installed a minimum of 6 inches above the highest downstream piping and/or outlets.

6. AVB's shall always be installed above the 100-year flood level unless otherwise approved by Engineer of Design.

All residential services used for fire sprinkler supply shall have as a minimum, an approved double check valve backflow assembly. The backflow assembly shall be placed at the meter or a location approved by the City’s Cross-Connection Specialist. There is no exception to the backflow requirement.

There may be situations where the flow requirement, available flow capacity, or unfavorable hydraulic conditions require a service that is dedicated to providing the flow to the fire sprinkler system. In such cases, a domestic meter of appropriate size is purchased along with the dedicated fire line listed below.

</tr>
</tbody>
</table>

All dedicated fire lines shall have, as a minimum; a City of Santa Barbara approved double check detector backflow assembly with a manufacture installed flow detection meter. The backflow assembly shall be placed at the curb above or below ground, per City of Santa Barbara Standards or a location approved by the City’s Cross-Connection Specialist. There is no exception to the backflow requirement.

Maggi Walker         Water Reclamation Specialist        564-5406
The rate for City water for private fire services when the use of a meter is not required shall be set by resolution of the City Council. (Ord. 3829, 1976.)

If an existing fire service line is found tapped for domestic use, a meter or detector-check device shall be installed on such service at the expense of the consumer and the regular meter rate shall be charged thereafter in addition to the fire service rate. All fire service lines installed after the effective date of the ordinance codified in this chapter shall have an approved detector-check and by-pass meter installed and such device shall be considered part of the fire service cost. (Ord. 2931 §2(part), 1963; prior Code §44.21.)

The right shall be reserved to disconnect fire service lines from the City main by direction of the Council on recommendation of the Director of the Public Works Department. (Ord. 2931 §2(part), 1963; prior Code §44.22.)
